METAL WINDOWS

SOLID SECTION STEEL WINDOW INDUSTRY

1119 Terminal Tower
CLEVELAND, OHIO

Membership

Member manufacturers of this Association may be identified as such in the following pages, by the line "Member Solid Section Steel Window Industry" in the title headings of their individual catalogues.

The SOLID SECTION STEEL WINDOW INDUSTRY includes the principal manufacturers engaged in the manufacture, distribution and erection of all or a number of the following products fabricated mainly from hot rolled steel sections:

Division "A." Windows of the horizontally pivoted or vertically pivoted type; pivoted window operators; windows of the commercial projected or architectural projected type; Underwriters' windows; continuous windows; continuous window operators; basement windows; utility windows; and industrial doors.

Division "B." Casement windows of the inward-opening and outward-opening type, hinged or projected from the side, top, or bottom; and casement windows of the horizontally pivoted or vertically pivoted type.

Purpose

The objects of the SOLID SECTION STEEL WINDOW INDUSTRY are to broaden the market and stimulate trade in the products of the Industry; to eliminate unfair methods of competition and uneconomic trade practices; and to develop methods and products to bring about general standardization and elimination of waste.

Use and Adaptability of Industry Products

There follows a list of the principal products of this Industry together with a brief indication of the more particular usage of each:

Pivoted Windows—This window is practically universally used on industrial plants, powerhouses, garages, and all similar construction where economy of first cost combined with a maximum degree of light and ventilation are the determining factors.

Projected Windows—Commercial—For high grade industrial construction and for schools, institutional buildings and similar construction where the superior and convenient features of the projected type window make it desirable.

Projected Windows—Architectural—For use on schools, office buildings, hotels and institutional buildings where a high grade window is required. Standard hardware is solid bronze and glass is held in place with continuous solid steel glazing stops.

Continuous Windows—These windows are adapted to use in monitors or in sawtooth construction. They are often used in powerhouses and industrial plants where their heavy construction and hinged-at-the-top feature provide for maximum ventilation with full protection during inclement weather.

Basement Windows—Now generally used in all residence construction where the inherent non-sticking and non-swelling advantages of steel windows are especially desirable.

Mechanical Operators—Operators for steel windows may be had in the tension design for continuous and pivoted windows, or in the torsion design (worm and gear, or rack and pinion) for pivoted windows and for short runs of continuous windows.

Industrial Doors—Tubular steel doors are the logical type for use in all industrial construction where their rugged strength provides ample resistance to the severe usage encountered in manufacturing plants, warehouses, garages, railroad shops, freight houses, etc.

Light Casements—The rapid expansion of the use of this product in the construction of homes, apartments, dormitories, hotels, and similar work, attests to its popularity gained through highly satisfactory performance in the residential field.

Intermediate Casements—These windows are suited for use on any building where rugged construction, high quality of hardware, and finished architectural appearance are essential requirements. These casements may be had with or without glazing beads.

Heavy Casements—Windows in this classification are intended for use on high grade building construction when the size of ventilator design is greater than the maximum recommended for the intermediate casement.

Casement doors are also furnished under this specification.

Casement Section Projected Windows—This high quality product may be used on practically any type of building. Its convenient control of natural ventilation with projected type ventilators, suggests its use particularly on schools, hospitals, offices, etc.

This classification includes also the "Combination Casement" made up of a pair of casement leaves with a projected type transom or a sill ventilator.

Underwriters' Windows—The Underwriters' Laboratories, Inc., will provide labels for most types of steel windows, provided certain special details of construction and limiting glass layout are followed.

Subframes—These are usually desirable on the more important public building projects employing casements; also, on large openings made up of any better grade steel windows, metal subframes with suitably designed mullions and imposts are often an architectural or a structural necessity.

Service and Consultation

All members of the SOLID SECTION STEEL WINDOW INDUSTRY offer products made in standard sizes in accordance with the latest U. S. Department of Commerce Simplified Practice recommendations, Pamphlet R-72. Individual details and data concerning the various Industry products will be found more completely in the catalogue insertions of the Member Manufacturers.

Information may also be had by consulting the "Where to Buy It" section in the classified telephone directory, under the heading "Windows, Metal" for the address of the nearest local representatives. These local offices will co-operate with architects, engineers, contractors, and owners in all matters relating to the use and cost of Industry products.

Standard specifications and building code recommendations, covering practically all divisions of steel window products, have been prepared for the use of public and commercial architects and engineers. Copies will be furnished on application.

ESTABLISHED 1883

THE ADAMS COMPANY

Manufacturers of Steel Windows and Steel Doors

Steel Street
DUBUQUE, IOWA

Products

ADAMS STEEL WINDOWS: Architectural, Industrial, Commercial, Basement, Utility and Agricultural.

ADAMS STEEL DOORS: Architectural, Industrial and Garage.

Also Adams Metal Frame Window Screens, Casement, Projector and Basement; Adams Wire Guards, Window, Partition and Special.

Adams Steel Casement Windows

Standard Type—Windows made to standard sizes and are outswinging. All windows fully equipped with suitable anchors and cleaning hinge. Hardware is designed special for screening. Screens can be installed easily.

Note: Inswinging windows can be furnished at an extra cost.

Heavy Type—Windows made special according to plans and specifications.

Adams Steel Industrial Windows

Center Pivoted Type—Standard sizes; details upon request.

Utility Type—One standard type, 6-light, 12x18 ins.

Adams Standard Outswinging Steel Casement Window

Adams Steel Commercial Type Projected Windows

Windows project either in or out and are equipped with all necessary hardware. Standard and stock sizes. Prices upon request.

Special sizes made to order.

Adams Steel Basement Windows

Detailed information and price sheets for standard and stock sizes upon request.

Top Hinged—Windows open in at bottom, hinged at top.

Bottom Hinged—Windows open in at top, hinged at bottom.

Adams Agricultural Steel Windows

Made especially for barns, poultry houses, hog houses, etc. Windows open in at top and can be raised up at bottom, so as to have bottom ventilation as well as top. Windows can be furnished with or without side shields.

Details and prices upon request.

Adams Architectural Steel Door, Special Design

Adams Steel Doors

Details and prices for standard size steel doors upon request. Special sizes made to order.

Architectural Type—Specially designed.

Industrial Type — Standard and special.

Garage Type—Special.

Special Work

Steel windows and doors made to specifications.

Let us submit elevations, details and prices on your special work, such as: steel store fronts, special steel doors, etc.

Our Engineering Department will gladly work out construction details and furnish drawings for approval.

Catalogues

Catalogues, construction and installation details mailed upon request.

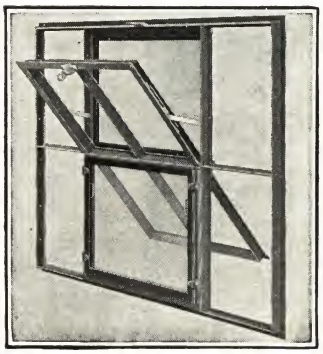
BAYLEY
STEEL WINDOWS & DOORS

Separate Catalogues Covering These Products Are Available
A Part of the Line is Offered in Wrought Iron, Bronze and Aluminum as Well as Steel

Bayley Products

For over half a century Bayley Products have been accorded considerable preference by the building industry. Bayley windows and doors maintain this record because Bayley has pioneered many important movements since the introduction of steel windows and doors. The products which have led the way have maintained high standards of quality in workmanship and material, of simplicity and efficiency in design and of continuous service and satisfaction to each user.



Bayley catalogues are consistent with the standard of the products. Each different window and door pictured and described hereafter is completely covered by its individual catalogue which contains sections, details and standard layouts. These catalogues are designed to permit easy tracery of details and sections for transfer to plans and construction drawings. You may have any or all catalogues and an indexed folder to file them in by asking either the Executive Office in Springfield, Ohio, or the district offices listed above. The Bayley man in every territory is a trained window and door specialist.

Pivoted Windows

Pivoted windows for sidewalls of factories, warehouses, garages, loft buildings, powerhouses and all other industrial buildings. Standard layouts and sizes are 12x18 and 14x20 in. They are made of heavy, rolled steel sections.

Design of sections insures permanence and low cost of maintenance. There are neither sharp edges which encourage corrosion, nor ledges where dirt and moisture may collect. Flat surfaces are neat, easily painted and require a minimum amount of paint. Pivoted windows have a deep angle frame of a sufficient size to provide a ½-in. engagement at head, jambs and sill in all wall constructions. Sections are 1½ in. or more in depth.

Pivoted Windows Screened

Pivoted windows screened for buildings requiring screen protection added to advantages of pivoted windows. Standard layouts and sizes are 12x18 and 14x20 in.

These screened windows protect materials and machinery in all kinds of manufacturing and distributing plants. They should not be confused with pivoted windows with screens attached in a makeshift manner.

Ventilators and screens are built together but screens are removable.

Screens made by THE WILLIAM BAYLEY CO. are an integral part of the window. They have solid steel frames in hot dipped galvanized finish. Bronze screen cloth in 16-mesh is standard.

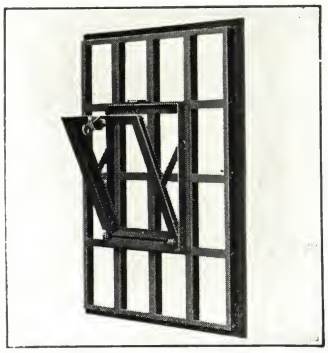
Projected Windows Commercial

Projected windows commercial for industrial buildings, garages, offices, storage and loft buildings. Standard layouts and sizes are 12x18 and 14x20 in. Windows are made to be glazed from the inside or the outside and this detail should be carefully specified.

Sections are 1½ in. deep and similar to those of pivoted windows. Projected ventilators permit use of shades and drapes. Screens when attached fit flat against weathering.

Corners of ventilators and ventilator openings are electrically welded and ground where necessary for strength. Ventilators have bronze sliding pivots at top for projected out and at bottom for projected in.

Projected Windows Architectural



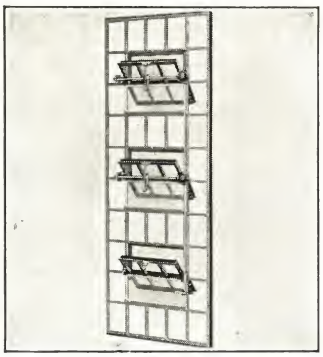
Projected windows architectural for schools, clubs, public and office buildings. Windows are made to be glazed from the inside or the outside and this detail should be carefully specified.

Frames are extra heavy deep flanged channels which provide for wall anchorage, rigidity and pleasing appearance.

Masonry, stucco, plaster and interior finish are brought directly against flanges of frames. Corners of ventilators and ventilator openings are electrically welded and ground. Ventilators project in and out to an extent which permits washing of outside surfaces from the inside.

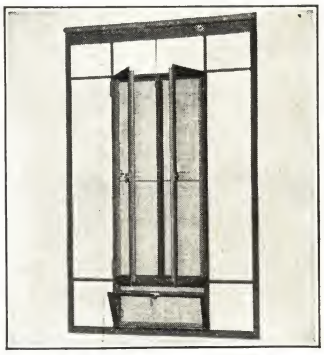
Hardware of bronze in matt bronze finish is standard.

BAYLEY STEEL WINDOW AND DOOR PRODUCTS



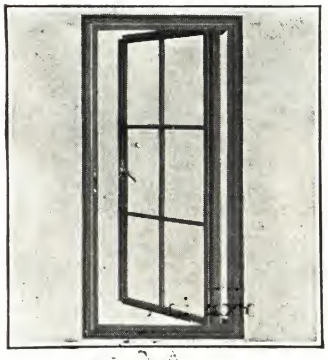
Guard Windows for Prisons Super Bar

Originated by THE WILLIAM BAYLEY CO. and protected by patents. For maximum and medium security buildings in prisons and jails. Also adaptable to banks, jewelry stores and warehouses, where protection from burglary is required.



Prison Windows Screened 1½-in. T-bar

For medium and minimum security buildings in prisons and jails. Ventilator is limited in its degree of opening to prevent escape. Average size of glass spaces 6x9 in. Screens cannot be removed by inmates.

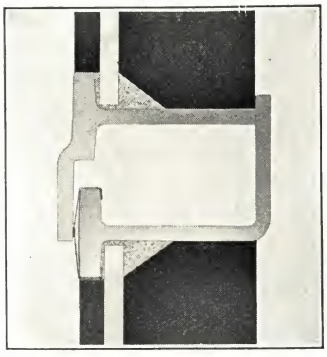


Prison Windows Screened with Mechanical Operator

For medium and minimum security buildings where windows come in high bays and require mechanical operation. Operation is by crank handle and operator is made by THE WILLIAM BAYLEY CO.

In-swinging Casements Weatherstripped and Screened

For hospitals, hotels, apartment houses and office buildings, provide safety from falling out, complete light and ventilation control and economy because of weatherstrip ping.

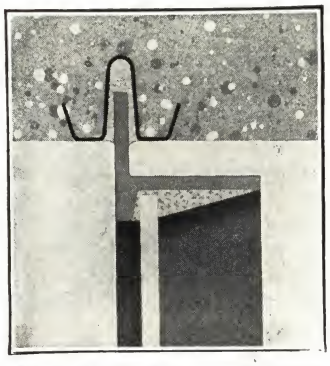


Steel Casements

For use in many kinds of buildings and various type of wall construction. Ventilators open out removing all obstruction within the building and permit draperies to hang with no interference with casement.

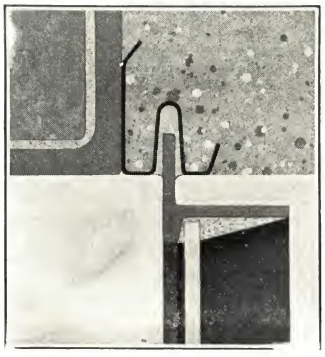
Casement Screens

Bayley screen for steel casements showing small door through which casement is operated. Screen fits tight against casement frame. Screens can be removed and replaced without special tools. Bronze screen cloth, 16-mesh, is standard.



Casement Weatherstripping

Spring bronze weatherstripping fits tightly on ventilator section and closes against frame section. Makes steel casement weathertight. Weatherstripping saves fuel bill. Bayley furnishes it as standard equipment.

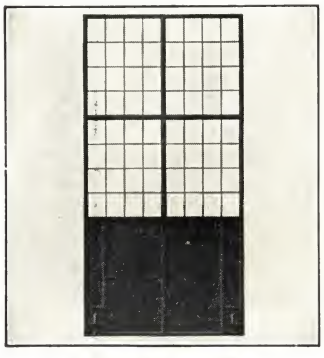


Continuous Windows and Operating Devices

Constructed of specially designed solid rolled steel sections and welded together for strength and permanency. Operators may be either manually or electrically controlled. Sturdy construction and good quality.

Steel Window Inserts, Concrete Construction

Save time and money by eliminating cement finishing and calking. Permit installation of windows in all kinds of weather and glazing may follow immediately after erection. Ventilators work freely when inserts are used.



Steel Window Inserts, Concrete Frame—Brick Veneer

Safeguard against corrosion and serve as an expansion joint. They also eliminate leakage where frame of window enters wall. Windows erected in openings provided with inserts, never become loose.

Tubular Steel Doors

Adaptable to industrial, commercial and airport buildings. They are made to swing, slide and fold, and are furnished complete with hardware. Corners are mitered and reinforced with heavy castings driven inside tubes.

Airplane Hangar Doors

Adaptable to straight and curved tracks in airplane hangars and factories. Heavy tubes are used to provide structural strength and neat finished appearance. Doors are completely welded together, an exclusive feature which gives superior strength.

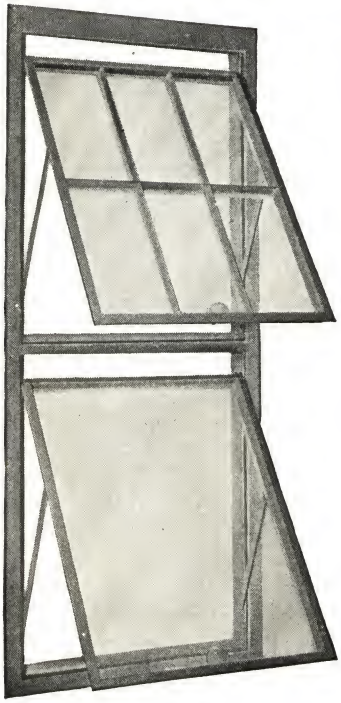
Literature

Catalogue No. 2 is available to all interested. It contains illustrations, details, and typical installations of all our windows and doors.

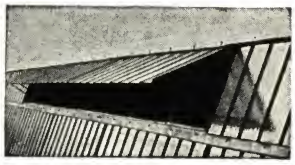


"Mostlite" Puttyless Basement Windows

This basement window (illustrated above) includes many features: ventilator stays open in any position and can be instantly removed, glazed on cork, weathertight, welded and riveted throughout. A fine window at a very reasonable price.

Sidewall Pivoted Windows

A window of guaranteed quality (illustrated above). Welded throughout, weathertight, durable, made to stand hard usage. For standard sizes and construction details, write for our complete catalogue.



Architectural Projected Windows

An attractive and well proportioned window welded throughout—all welds ground. It is designed with the utmost care for appearance, ventilation and screening.

This window is ideal for office buildings, etc. (illustration at left). Made in both steel and aluminum.

Operation of ventilators and tightness guaranteed. Inside putty glazed for easy replacement of glass.

Top Hung Continuous Windows

We have furnished this type of window for some of the country's largest manufacturers. Names on request. These windows are welded throughout, and of rigid construction that will last.

Bliss "Manifold" Window

A fine utility steel window of good design, welded or riveted throughout. This window is proving very popular for private garages, penthouses, and small stores. A window that operates very easily and will give a lifetime of continuous service.

Bliss Steel Tube Doors

The Bliss Steel Doors are carefully constructed. They are made of heavy tube steel, welded and ground throughout.

The proper door for industrial buildings.

Stiles are wide enough to take any standard lock with standard backset.

CAMPBELL CASEMENT WINDOW CORP.

Manufacturers of Steel, Bronze and Aluminum Windows and Doors

Pershing Square Building, NEW YORK, N. Y.

SALES REPRESENTATIVES IN PRINCIPAL CITIES

Products

HEAVY SECTION WEATHERSTRIPPED CASEMENTS and DOORS, in steel, bronze and aluminum; STANDARD STEEL WEATHERSTRIPPED CASEMENTS; DOUBLE GLAZED CASEMENTS; BALANCED STEEL WINDOWS; and CASEMENT PROJECTED WINDOWS in steel and aluminum.

Also Heavy and Standard Casements non-weatherstripped.

Weatherstripping

The efficiency of the Campbell method of weatherstripping casements is definitely proven by the performance of 3,300 Campbell Weatherstripped Casements installed in the Harkness Memorial Quadrangle at Yale University in 1920. These casements are absolutely weatherproof and have given complete satisfaction. It is a convincing example of a permanent and thoroughly efficient method of weatherproofing.

Campbell Weatherstripped Casements eliminate inleaking air draughts and water—they are stormproof and dustproof.

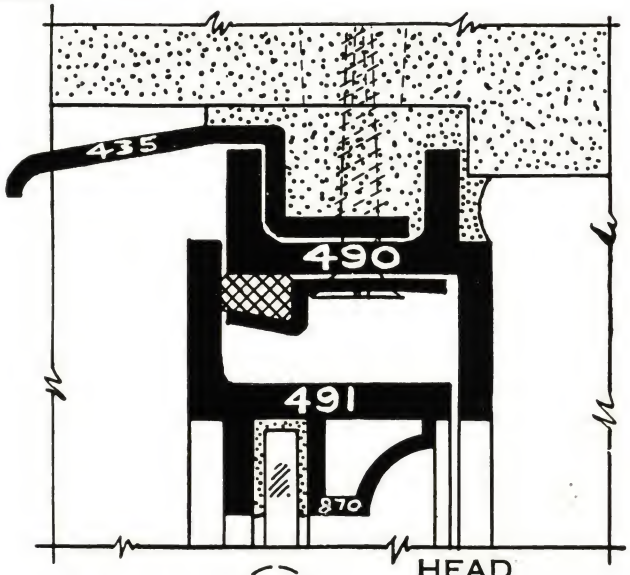
Furnished in two weights of steel sections, the Heavy 400 Series sections and the Standard 100 Series sections. They are also furnished in aluminum and bronze.

Campbell Weatherstripped Casements—400 Series

Furnished with muntins or for leaded glass.

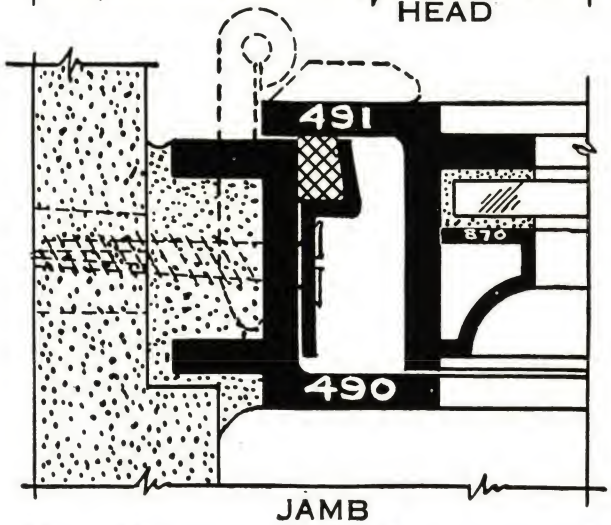
This series embraces side hung or pivoted casement windows for residences, banks, clubs, public buildings, churches, etc., balanced and projected windows for hospitals and schools, double glazed windows (either side hung or pivoted) and casement doors.

The appearance of both fast and opening portions is identical throughout. Whether opening or fixed, the sight lines of all windows are exactly similar and the glass is in the same plane. Hinges are of solid bronze, of unusually substantial design.



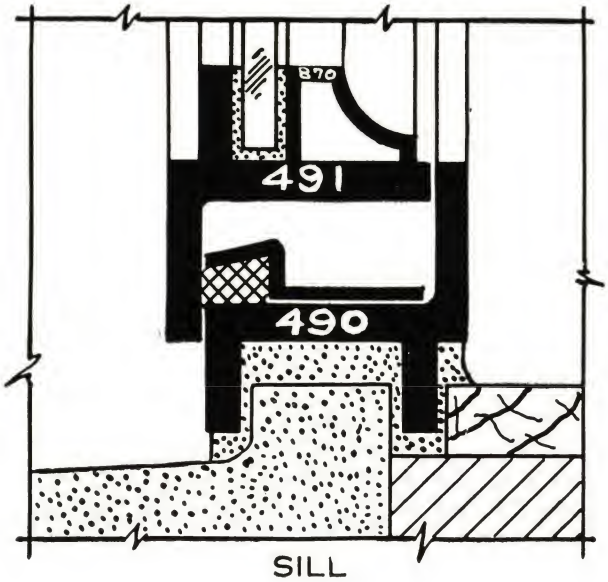
Campbell Pivoted Casements are hung on our special solid brass, machine turned pivots of large diameter. They are formed with two ribs on the outside of each part designed to prevent any thrust on the screws that hold them in position. Bars to which the pivots are fixed are machined from solid, continuous sections, instead of being formed by reversing and welding two bars together. Weathering is solid with the frames and not obtained by use of welded or screwed beads or strips.

Construction—The Campbell Weatherstrip is inserted in a dovetailed groove in the casement frame. The sash is so arranged as to make a continuous contact with the weatherstrip in addition to the usual metal to metal contact. Cross joints of glazing bars are locked to avoid cutting away the strength of the bar at the joint and to give a distinctive appearance to the window. All corners are mitered by specially designed tools and then welded solid. All contacts polished smooth.



Hardware—2-point solid bronze handle. Bronze sliding adjusting stay. Extension hinges, permitting cleaning the window from the inside.

Non-weatherstripped Casements—400 Series



400 Series Casements can also be furnished, if desired, in non-weatherstripped sections.

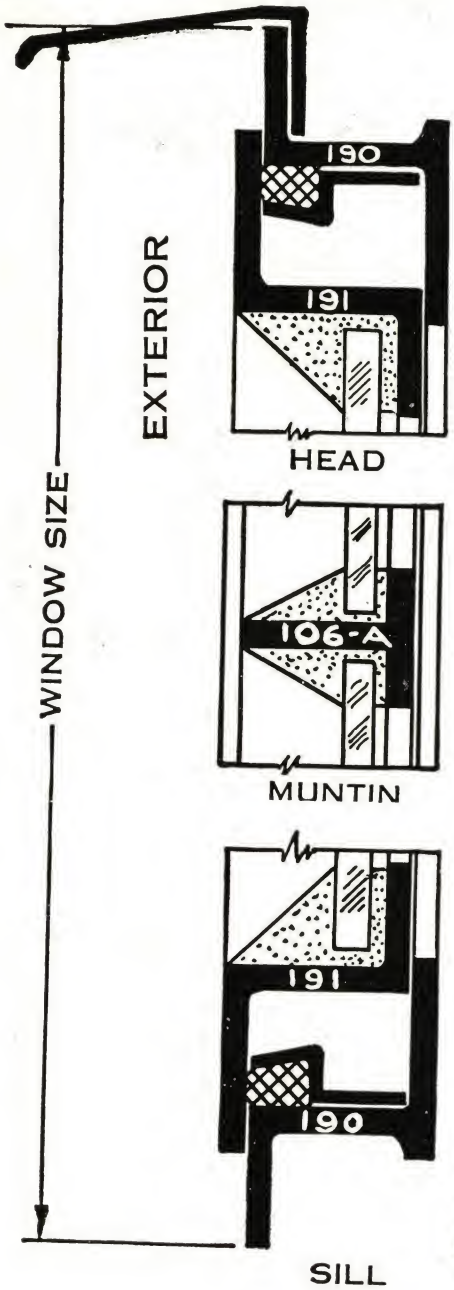
HEAD

JAMB

SILL

Campbell Standard Casements—100 Series

Furnished with muntins or for leaded glass.



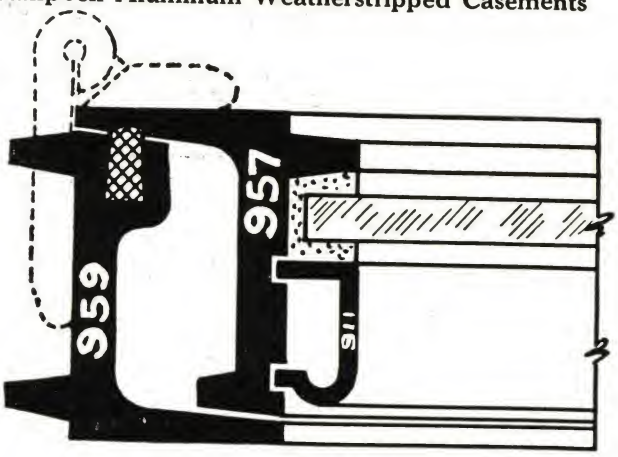
Campbell Casements are arranged for coupling together by means of our heavy mullions and transom bars, specially designed to afford double weathering and rigidity, neither of which is secured when T-bars are used for this purpose. This feature enables the use of these windows in large openings, even when exceptional wind pressure must be provided against.

Material Specifications—Windows are constructed of rolled mild steel sections of best quality, hydraulically straightened. Cross joints of glazing bars are locked to avoid cutting away the strength of the bar at the joint and to give a pleasant and distinctive appearance to the windows.

The frame member is so designed that an undercut slot is formed for the reception of a continuous felt weatherstrip around its entire perimeter. The sash is so arranged in the frame that it makes one weathering contact with the felt weatherstrip and one weathering contact with the steel frame.

All corners are mitered by specially designed tools and then welded solid.

All casements open outwards and are hung on heavy steel hinges, with ⅜-in. diameter bronze pins. Side hung casements are fitted with two-point solid bronze handles and solid bronze sliding adjusters. Top hung casements are fitted with hinges and solid bronze peg stay with pin and rest.



Vertical Section Campbell 100 Series Casement

All fittings have bronze working parts.

These windows are designed for building in as the work proceeds and anchors are provided for this purpose. Where it is desired to erect these in wood or stone, countersunk fixing holes are provided.

100 Series Casements can also be furnished, if desired, in non-weatherstripped sections.

Campbell Aluminum Weatherstripped Casements

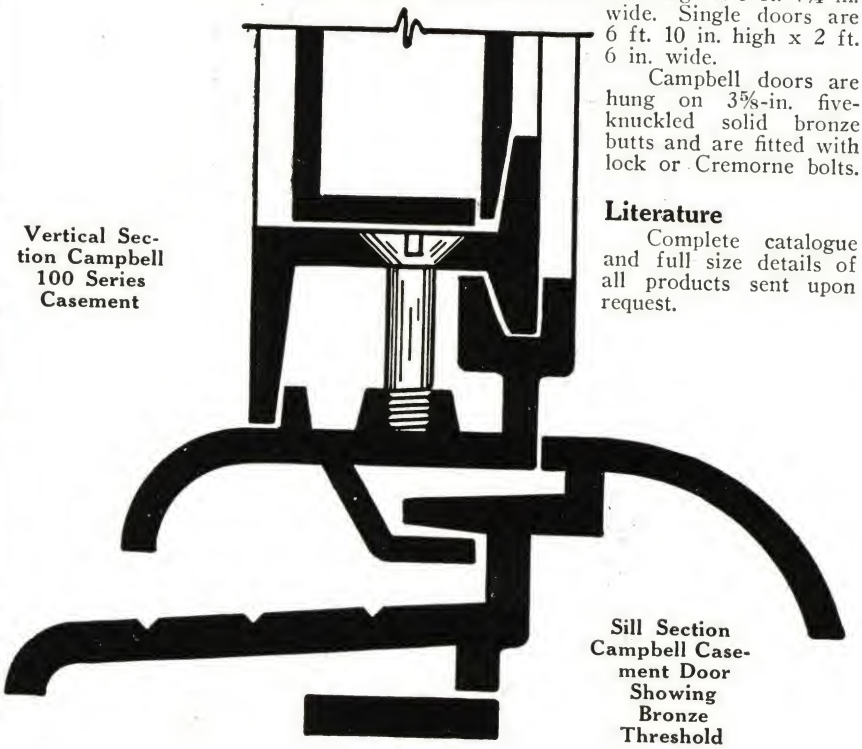
JAMB

Frame and sash members are of aluminum extruded sections. The frame member is so designed that an undercut slot is formed for the reception of a continuous felt weatherstrip around its entire perimeter. Sight and glass lines are exactly similar throughout, whether fixed or opening sash.

Furnished either for outside glazing with spring clips and putty, or with glazing beads, either inside or outside glazed, as specified.

All hardware is of white bronze, cadmium plated, satin finish. Handles are of lever type and are provided with two ventilation notches. Stays are of the sliding, non-projecting thumbscrew type. Cleaning hinges are provided where required.

Transom bars have the weatherdrip rolled solid with the section.



Campbell Casement Doors

All Campbell Casement Doors are made in 400 series sections as we are unable to recommend a lighter weight section for doors. Standard doors are 6 ft. 10 in. high x 3 ft. 4¼ in. wide. Single doors are 6 ft. 10 in. high x 2 ft. 6 in. wide.

Campbell doors are hung on 3½-in. five-knuckled solid bronze butts and are fitted with lock or Cremorne bolts.

Campbell Solid Metal Windows

Model No. 26-MW Double Hung—All exterior parts of the sash and frame, as indicated on detail drawings, are formed of No. 12 gage blue annealed steel, the balance No. 14, 16 and 20 gages. Sash weights are single-unit castings. Chains are of steel, hot galvanized, with galvanized connectors to sash and weights. Rubbing strips are on each jamb at ends of meeting rails. Screws are of steel with standard 10-24 machine thread and heads as detailed. Cast iron sills and stools furnished for this model, if desired.

Model No. 25-MW Double Hung—Materials entering into the construction of Model No. 25-MW are essentially the same as described for Model No. 26-MW with the exception that the sash members are made of No. 14 gage steel and weight boxes and jamb cover of No. 20 gage. Sills are of No. 12 gage drawn steel.

Assembly—Sash frames have mitered and welded corners. Glazing stops are secured without screws on interior. Members forming jambs and head boxes are welded together. The frames are shipped with sash, pulleys and chains installed.

Weathering—Sill, meeting rails and head are fitted with metallic flexible weather stops. Vertical guides and sash members are fitted with metallic flexible interlocking weather stops within the boxes.

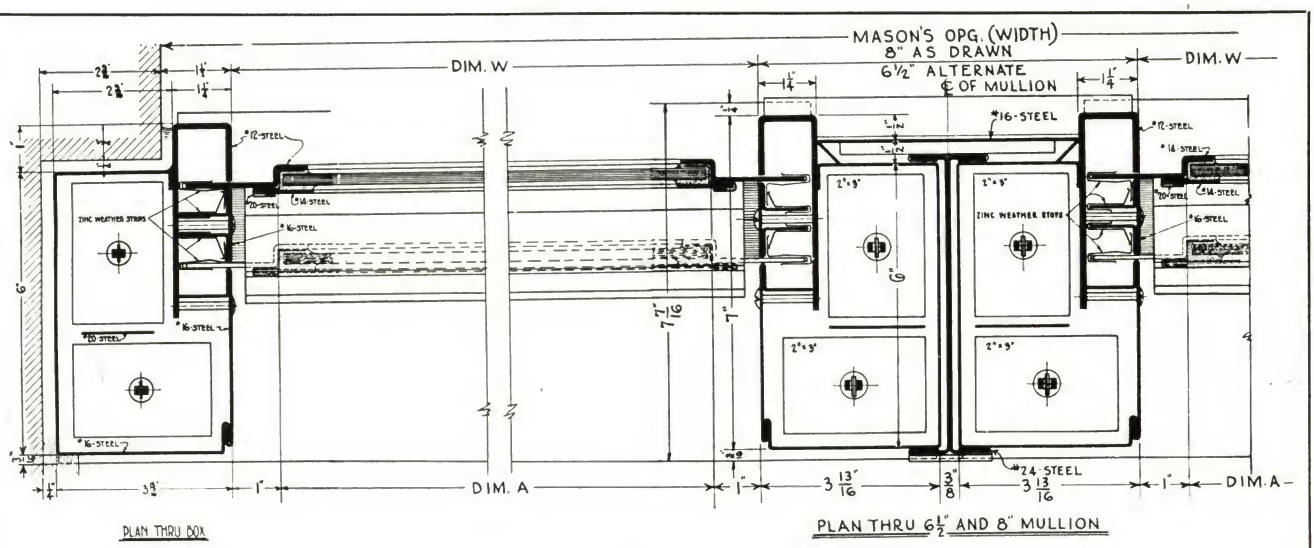
Guarantee—The amount of infiltration of air through standard double hung windows is guaranteed not to be more than ½ cu. ft. of air per foot of sash perimeter per minute when subjected to a static air pressure equivalent to the pressure exerted by a wind of 25 miles per hour.

Adjustment—Sash have concealed adjusters to prevent sash members from rubbing on exposed face of jambs and scraping paint.

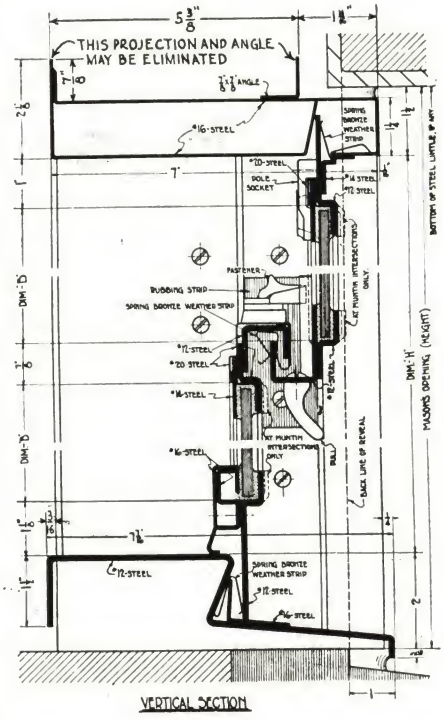
Finish and Hardware—All steel in windows, except inside glass stops and inside cover plates, is galvanized after fabrication.

All finish hardware is solid bronze, polished and unlacquered.

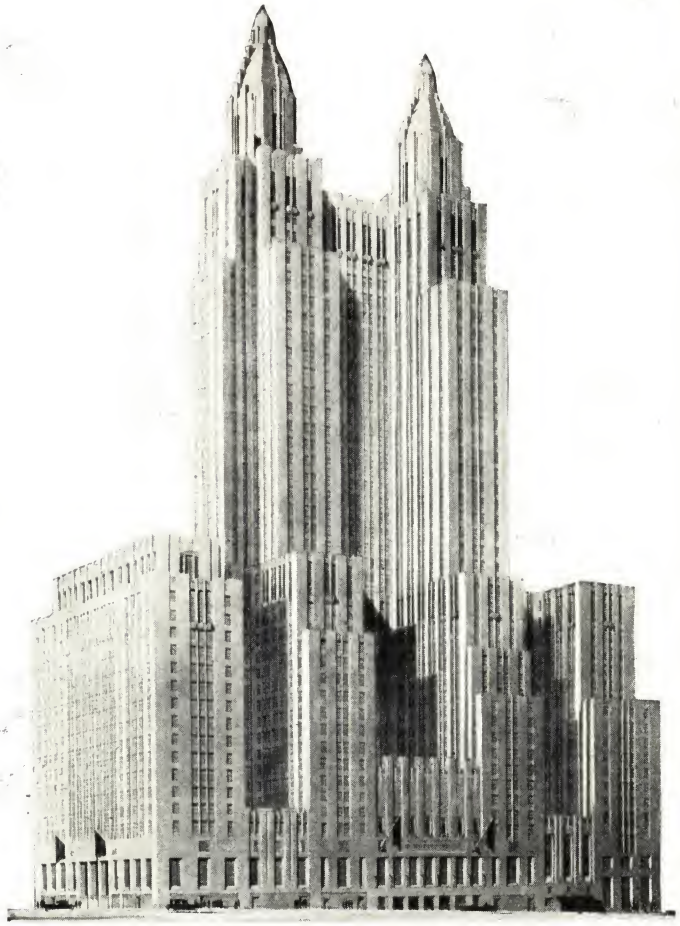
Painting—All parts of window shall receive a coat of best quality paint, baked on.



Labels—Where required, windows are made in accordance with the regulations of the National Board of Fire Underwriters and bear their label.



Aluminum and Bronze Windows



All types are made in aluminum or bronze if desired.

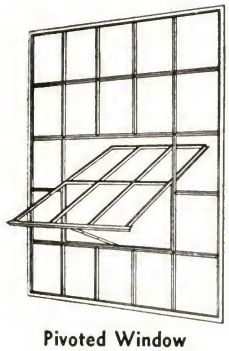
Ceco



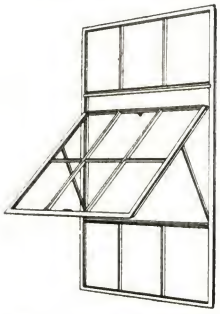
PRODUCTS

Service

Branch offices and warehouses are conveniently located in the principal cities. Trained engineers and service men are available in your locality to handle personally your window and operator problems.

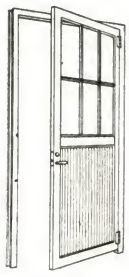
Screens

Ceco Metal Frame Screens are available for Ceco Steel Windows. Windows and screens are designed so that the window and screen are a complete unit. All fitting of screens and windows is done at the factory.



Pivoted Window

Rustproofing



The life of a steel building product is dependent on its protection from rust. We can furnish Ceco Windows rustproofed by the Parker Rust Proof Company's "Parkerizing Process" at a slight extra charge over standard. This small initial investment will pay large dividends in increased life of the window and savings in maintenance.

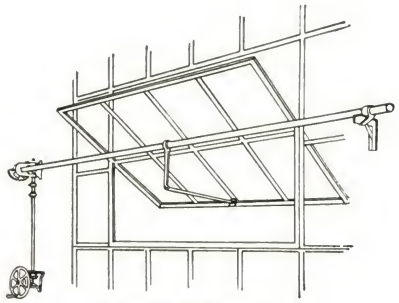
Types of Ceco Products

Ceco Pivoted Windows—A sturdy, weatherproof window for general industrial use. Standard sizes.

Ceco Torsion Operator—For group control of pivoted or projected ventilators. Machine cut cast gears and cut steel worms—a lifetime operator.

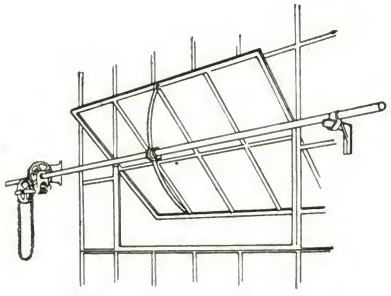
Ceco Basement Windows—Brighten the basement. Do not stick, warp or swell. Weathertight.

Ceco Commercial Projected Windows—Standard and screened type available. Easily and economically screened.



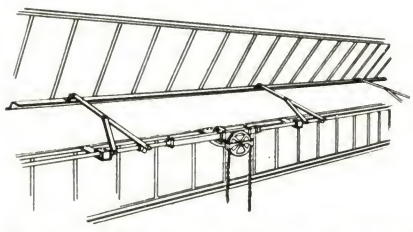
Ceco Rack and Pinion Operator—For long lines of ventilators. Cold rolled steel rack and pinions with machine cut teeth.

Ceco Industrial Doors—Heavy channel frame construction. Built to stand the wear and tear of industrial use. A permanent investment.



Ceco Casements—For residential buildings. Flat screens and under screen operators. Neat and attractive hardware.

Ceco Continuous Windows and Tension Operators—For use where large areas of light and ventilation are required.



Ceco Architectural Projected Windows—Large glass lights attractively arranged. Screened type as well as standard type. Excellent for schools and hospitals.

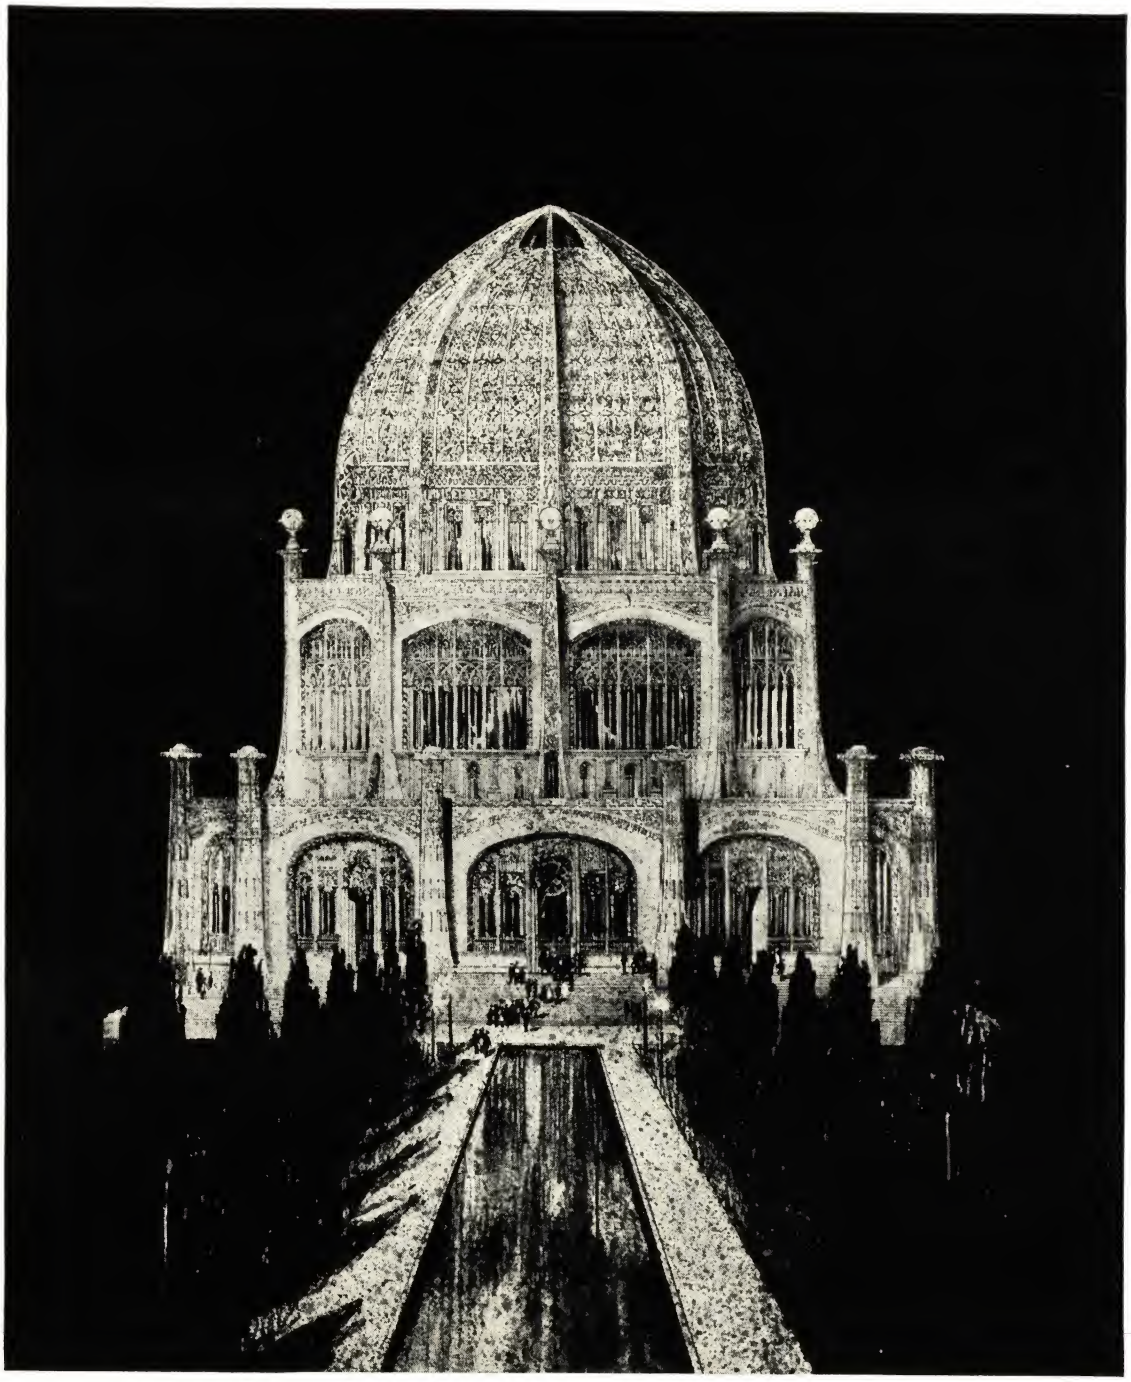
*Our decision to manufacture aluminum windows was not reached in time that we could include details and specifications in this catalogue. However, we are confident that at the time this edition is published we will be in a position to furnish aluminum casements. We invite your inquiries for complete information.

OUR GUARANTEE

AND

STANDARDS OF MATERIAL AND WORKMANSHIP

CRITTALL Casement Windows as described in the following pages are the result of many years of specialized experience and continuous improvement. Only materials which have been carefully selected and thoroughly tested are used. Experienced workmen assemble and fit them, and each window is subjected to rigid inspection before shipment. We maintain an efficient corps of mechanics in each section of the country to install our windows, and urge architects to insist on the performance of this work by the manufacturer.



When we install Universal Casements or Norman Casements we guarantee them wind and water tight, without the use of weatherstrips of any kind. When circumstances do not permit us to perform the installation work, we pledge ourselves to deal justly with our customers; to make any necessary adjustments without charge where possible or at only nominal expense; and to interpret our responsibility in a liberal manner to the end that the customer may always be satisfied with the completed installation. Stanwin Casements are less expensive windows, produced in great quantities and designed for less particular use, so they cannot measure up to the efficiency of Universal and Norman Casements, but when properly installed we guarantee them to be absolutely weathertight and sufficiently windtight for average conditions.

UNIVERSAL CASEMENTS

CRITTALL CASEMENT WINDOW COMPANY

DETROIT, MICHIGAN

THE Universal Casement, in solid steel or bronze, is manufactured to meet architects' sizes, designs and most exacting specifications.

It is available in either heavy or medium weight sections, and being custom built, it may be furnished to suit any arrangement of ventilation required, within reasonable limitations.

Side hinged and top hinged outward opening casements may be fitted with detachable flat screens and hardware specially designed to permit operation without moving the screen.

All hardware is solid bronze and conforms to accepted designs for casement fittings.

The excellence of the Universal Casement is attested to by its acceptance by foremost architects for use in thousands of the country's finest buildings.

SPECIFICATIONS

Windows—All windows shall be Crittall Universal Casements as manufactured by the CRITTALL CASEMENT WINDOW COMPANY, Detroit, Michigan. They shall be custom built to the sizes and designs shown on the drawings. Shop drawings must be submitted for the architect's approval before starting fabrication. They shall be fabricated from hot rolled steel casement sections weighing not less than 3.25 lbs. per lineal foot for medium section, and 4.50 lbs. per lineal foot for large section, including the swinging leaf and outer frame, but not including glass stops or any sub-frame. The table of maximum sizes on page 5 of Crittall's catalogue in Sweet's current edition shall govern the weight of section to be used for windows covered by this specification.

All corners shall be electrically welded and exposed surfaces ground smooth. Ventilating units shall have two points of contact all around. Sections shall be so designed that in composite openings glass will be in the same plane in stationary and ventilating units and sight lines will be uniform throughout.

Paint—All steel sections shall be cleaned free from rust and scale and painted one coat of red rust-resisting primer and one coat of dark gray primer, each coat baked on separately.

Glazing—(Optional) (Casements shall be furnished with spring clips for putty glazing from the outside.) or (Casements shall be fitted with moulded steel glazing stops for glazing from the inside. These shall be carefully mitered and individually fitted to each pane, using countersunk brass screws.)

Hardware—Shall be solid bronze, polished, finished a dark coinage color. After careful fitting at the factory, hardware shall be removed from the casements and shipped separately for protection of finish.

Note: Specify handles, stays, etc., for various types of windows by number. See pages 6, 7 and 8 for standard hardware and page 9 for special hardware.

Casements 5 ft. 0 in. high or over shall have a two-throw latch.

(When casements are extremely high or they are so located that it would be awkward to operate from near the sill, a three-throw latch should be specified.)

(Optional) (Hinges shall be solid bronze butts with hardened steel pins, 3¼ in. high for medium section, and 4 in. high for large section.) or (Hinges shall be drop forged steel pivots, cadmium plated, securely welded to the frames.)

Two hinges shall be applied to casements under 6 ft. 0 in. high and three hinges to casements 6 ft. 0 in. high and over.

Note: Steel pivot hinges are less expensive than bronze butts and facilitate fitting of casements without any sacrifice of efficiency, so they will be included in estimates unless bronze butts are specifically called for.

Note: When doors are included specify which of the following items are required: Bronze thresholds, double thick steel kick plates, cylinder locks, dummy lock to match, concealed Cremorne bolt lock, door holders, friction stays, bronze top and bottom bolts.

Frames—(Optional) The window manufacturer shall furnish and deliver to the building site, frames of 12-gauge pressed metal as shown on the drawings. These shall set in place, plumb and square, and built in by the Mason Contractor. Caulking under another heading. See pages 15, 16, 17.

Fins—(Optional) Continuous angle fins shall be furnished for the head and jambs and installed with the casements. See pages 21, 27.

Erection—All windows shall be set in place and properly adjusted by the manufacturer, and all joints between the steel window and collateral construction shall be made tight with Crittall Mastic Cement, neatly pointed.

Notes to Be Included in Specifications of Others

Mason—When pressed metal frames are used, specify that the mason shall set them in place, plumb and square, and build them in. Caulking under this heading or a special heading.

Glazier—When steel glazing stops are used, insist that the glazier remove them from one pane at a time and after placing glass, screw stops back into place before proceeding with the next pane. For large lights specify that the glazier use wood wedges as directed by casement manufacturer. A good grade of steel sash putty should be specified.

Painter—Prime coats only are applied by the manufacturer. Specify that the painting contractor shall apply in the field two coats of the desired color and quality.

MAXIMUM SIZES

Note—Dimensions may be exceeded only upon consultation with manufacturer.	Large section		Medium section	
	Width	Height	Width	Height
Side hung casements.....	3′ 0″	8′ 0″	2′ 6″	6′ 0″
Vertically pivoted casements.	4′ 6″	8′ 0″	3′ 6″	6′ 0″
Folding casements and doors.	6′ 0″	8′ 0″	5′ 0″	6′ 0″
Top hung and bottom hung casements	5′ 0″	4′ 0″	4′ 0″	3′ 0″
Horizontally pivoted casements	5′ 6″	4′ 0″	4′ 6″	3′ 6″
Projected casements	5′ 0″	3′ 6″	4′ 0″	2′ 6″

Note: This table is based on our experience of the limitations of medium and large sections under usual conditions. In some cases these limits might be extended safely, but only after consulting our Engineering Department. Sizes of transoms may be increased when mechanically operated.

MECHANICAL OPERATORS

FEDERAL RESERVE BANK, RICHMOND, VA.
Carneal and Johnston, Architects

Crittall Rod Gearing

Rod gearing is designed to operate a number of transoms (preferably not over four) from one station. It may be used on any type of ventilating transom except side hinged. The arms and horizontal rods are painted iron. The down rod may be either iron or polished bronze as specified. The gear box and handle are always bronze. Supplied only when specified.

Crittall Rack Openers

Substantially made of solid bronze, this fitting is for the operation of individual transom units where the projecting arm is not objectionable. It is used on either bottom hinged in-opening or top hinged out-opening transoms.

It is supplied only when specified.

Crittall Duplex Gearing

This fitting is for use on either bottom hinged in-opening or top hinged out-opening transoms, operating single units only.

Supplied only when specified.

TYPICAL INSTALLATIONS

Bronze Universal Casements are constructed of extruded sections of the same design as used for steel medium and heavy weight Universal Casements, but slightly heavier in cross sectional area to compensate for the difference in the natural strength of the two metals. Fixed light sections are formed to the same contour as the combined casement sections as illustrated below, giving uniformity of appearance to the stationary and ventilating units in a composite opening.

Hardware is the same as for steel Universal Casements, except that the bronze butts have terminal ends to the phosphor bronze pins to add a touch of refinement to the general appearance of the window.

The finish required should be definitely specified. Generally these casements are furnished in natural finish, as the weather quickly tones them and gives them a much desired appearance of age that cannot be duplicated by artificial treatment. However, they can be finished a dark coinage color to match the hardware at extra cost. These finishes should be applied after installation; otherwise, they will be damaged before occupancy.

NORMAN CASEMENTS

CRITTALL CASEMENT WINDOW COMPANY

DETROIT, MICHIGAN

NORMAN Casements are heavy standard windows, available in both out-opening and in-opening types in a complete range of sizes, combinations and shapes, and are adaptable to use in any type of building. They were created as a standardization of the Crittall Universal Casement, a custom built window, and possess the same characteristics of design and workmanship as does this justly famous window.

The high standards of material and workmanship incorporated in these casements enables this Company to guarantee unquestionably that they will be wind and watertight, without weatherstrips of any kind. To add to their appearance of quality, they are equipped with excellently designed and durable hardware.

Particularly for use in residence work, the Norman Screened Casement may be furnished to provide a detachable flat screen designed as an integral part of the window. Special hardware permits complete operation of the window without moving the screen.

Norman Casements, of the screened or non-screen type, may also be furnished in special sizes at slight extra cost, providing the construction and fittings remain standard, and sizes do not exceed 2 ft. 6 in. wide and 6 ft. 0 in. high.

The Norman Casement Door is made as a double door of sturdy construction in a single standard size. It is designed to open out or in, and embodies the same characteristics of construction and appearance as does the Norman Casement.

The advantages of the Norman Casement line are immediately evident as quality to please the most exacting, coupled with the economy made possible by standardization of a high grade product.

SPECIFICATIONS

Windows—All windows shall be Crittall Norman Casements as manufactured by the CRITTALL CASEMENT WINDOW COMPANY, Detroit, Michigan. All windows shall be standard sizes and types as shown on architect's drawings. Shop drawings must be submitted for the architect's approval. Casements shall be furnished complete with standard solid bronze hardware, finished in dark coinage color. Steel sections, including ventilating section and frame, but not including glass stops or sub-frames, shall weigh not less than 3.25 lbs. per lineal foot.

The casements shall be installed by the manufacturer. (If this is impractical, they can be set by local labor but care should be exercised to see that they are erected according to the manufacturer's instructions.) All joints between the steel sash and the collateral construction are to be made tight with the use of Crittall Mastic Cement neatly pointed on the exterior.

Screened Casements

Specifications for Norman Casements are to be followed for Norman Screened Casements with the following additions:

All casements shall be prepared with two anchor buttons, located on the jambs near the top to receive flat steel (bronze, if desired) frame screens, which are also included in this contract. These screens shall have 16-mesh (18-mesh, if desired) antique bronze wire cloth. Screen frames shall be painted to match the casements. (If bronze, finish to be statuary.)

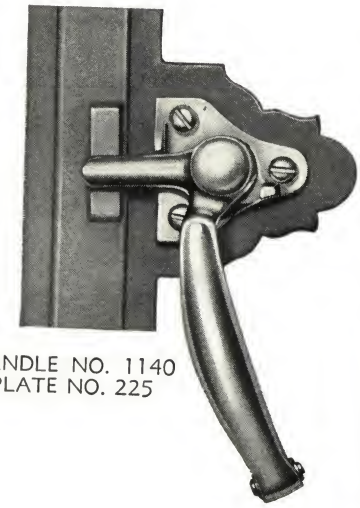
Screens shall be installed under another heading. (The original installation of screens should be included in the general or carpenter's contract, as they would be damaged if installed at the time of erection of casements, and due to being especially designed for simplicity of attachment and removal, do not require the services of skilled casement workmen.)

Extras To Be Included If Desired

The casements are to set directly into prepared masonry openings, and the manufacturer shall supply continuous angle fin around the head and jambs of all openings for making a perfect joint between sash and masonry. (If casements are set in Utility or Hollow Metal Frames, specify these to be furnished under the casement contract and to be built in by the mason contractor.)

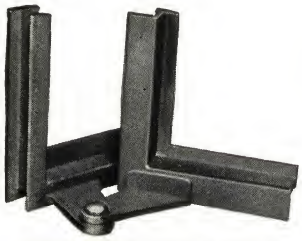
Norman Casements are made with spring clips for putty glazing from the outside. If glass stops are required, a steel angle stop may be specified, applied only on the outside and set with round head bronze screws.

NORMAN CASEMENTS
STANDARD HARDWARE



FRICTION STAY
(Supplied when specified)

SCREENED CASEMENT
HANDLE NO. 1270



Standard hardware on Norman Casements is Handle No. 1006 or No. 1140, and friction hinges. When specified, non-friction hinges may be supplied with friction stay applied at the head of the casement. Handle No. 1270 and Operator No. 1275 are standard for all Norman Screened Casements. All handles may be furnished with two throw latches when casements are 5 ft. 0 in. high or over, or when the casement is so located that a single handle would be out of reach.

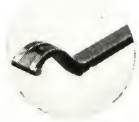
NORMAN SCREENED CASEMENTS

THE Norman Screened Casement is the result of careful study and experimentation, directed toward producing a compact unit, combining beauty and utility. The screen is available in either steel or bronze with antique bronze cloth. The rigid frame lies perfectly flat against the casement and, having a beveled return to the screen cloth, does not provide a ledge for dust. It is held securely on the casement by the hardware brackets at the bottom, and by two anchor buttons near the top. Complete operation of the casement—opening, closing, and locking—is accomplished without moving the screen. For cleaning windows or storage purposes, the screen is quickly removed and readily replaced.

The very simplicity that gives easy operation contributes to the attractiveness of the solid bronze fittings, which were created to conform with the generally accepted design of casement hardware. The fitting at the sill not only serves to operate the window, but also holds it open in any desired position by thumb screw adjustment; and, in addition, by engaging it in the bracket rest when the window is closed, the casement is effectually locked. A handle of pleasing appearance, engaging in a beveled strike plate, pulls the sections snugly together, insuring perfect wind and weather tightness.

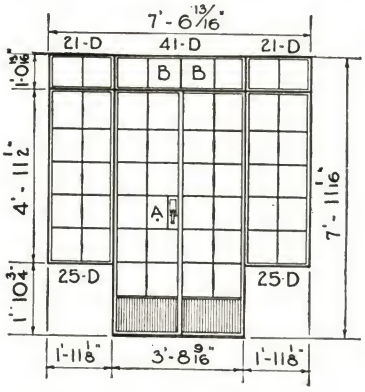


Operators are completely of bronze and have no mechanical parts that will loosen with normal usage. They are designed for attaching to the frame without cutting away the sections and risking air infiltration.

OPERATOR FOR
SIDE HINGED CASEMENT

AT RIGHT:
HANDLE

OPERATOR BAR FOR
HAND OPERATION ONLY



The solid bronze locking handle is attached to the outer frame with sufficient clearance for trim and plaster. Note that the window sections are not cut any place to accommodate the handle, so none of the weathering of the casement is lost.

STANWIN CASEMENTS

CRITTALL CASEMENT WINDOW COMPANY

DETROIT, MICHIGAN

THE Stanwin Casement is a standard light weight window which is stocked in a complete range of types and sizes, and is most suitable for use in residences, apartment houses, hotels, institutional type buildings and similar structures.

The Stanwin Casement, though of lighter section than the Universal and Norman Windows, maintains the same thoroughness in manufacture and careful inspection as do these other products of Crittall. They will be found suitable in every respect to meet the most exacting weather conditions, as well as to present an excellent appearance.

Where screens are necessary the Stanwin Screened Casement is recommended. This provides a detachable flat screen designed as an integral part of the window. Specially designed hardware permits complete operation of the casement without moving the screen.

Due to the inadequacy of light weight sections for door construction, the Crittall Standard door, using medium weight section is used in conjunction with Stanwin installations. These may open out or open in. Side lights and transoms are also made of medium section.

Stocks of Stanwin Casements and Doors in standard types and sizes are held at principal distributing centers, insuring prompt delivery.

SPECIFICATIONS

Windows—All windows shall be Crittall Stanwin Casements as manufactured by the CRITTALL CASEMENT WINDOW COMPANY, Detroit, Michigan. All windows shall be standard sizes and types as shown on architect's drawings. Casements shall be furnished complete with malleable iron handles and sill adjusters with bronze slide bars. Friction hinges may be substituted for sill adjusters. Steel sections, including ventilating section and frame shall weigh not less than 2.0 lbs. per lineal foot. Casements shall receive one coat of primer before shipment.

The casements shall be installed by the manufacturer. (If this is impractical they can be set by local labor but care should be exercised to see that they are erected according to the manufacturer's instructions.) All joints between the steel sash and the collateral construction are to be made tight with the use of Crittall Mastic Cement neatly pointed on the exterior.

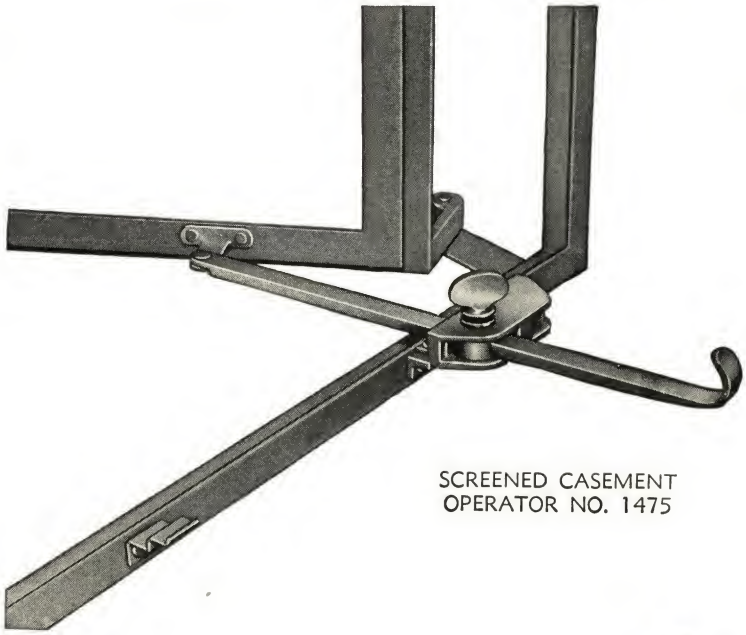
Screened Casements

Specifications for Stanwin Casements are to be followed for Stanwin Screened Casements with the following changes:

Hardware shall be standard die cast handles and sill operators with dull black finish, designed to operate the casements without moving the screens.

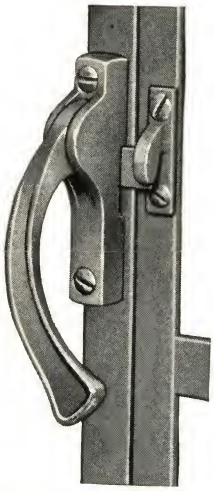
Casements shall be suitably prepared to receive flat steel (bronze, if desired) frame screens, which are also included in this contract. These screens shall have 16-mesh (18-mesh, if desired) antique bronze wire cloth. Screen frames shall be painted to match the casements. (If bronze, finish to be statuary.)

Screens shall be installed under another heading. (The original installation of screens should be included in the general or carpenter's contract, as they would be damaged if installed at the time of erection of casements, and due to being especially designed for simplicity of attachment and removal, do not require the services of skilled casement workmen.)



Extras to Be Included if Desired

The casements are to set directly into prepared masonry openings, and the manufacturer shall supply continuous angle fin around the head and jambs of all openings for making a perfect joint between sash and masonry.



The manufacturer shall supply wood surrounds of Clear Heart Redwood, kiln dried, for all openings. These shall be cut to exact length to fit casements, and shall have mitred overlapping joints. They shall be delivered to the job in cartons, with the necessary screws, ready for attaching to the casements at the time of erection.

STANWIN CASEMENTS

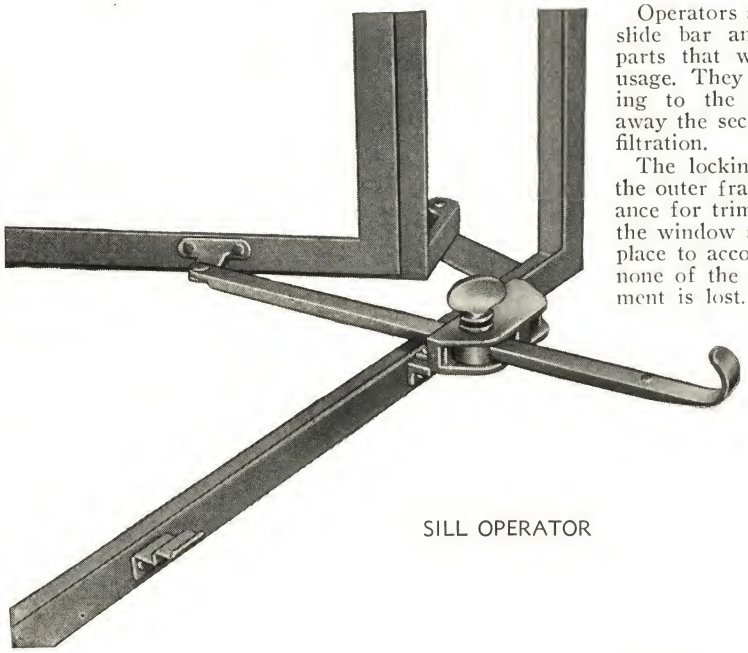
FULL SIZE DETAILS OF WOOD SURROUND

HEAD (JAMB SIMILAR)

WOOD SURROUNDS OF CLEAR HEART REDWOOD KILN DRIED ARE FURNISHED BY US TO FIT ALL STANDARD SIZE STANWIN CASEMENTS, AND ARE SUPPLIED WITH SCREWS, READY FOR ATTACHING TO SASH AT TIME OF ERECTION

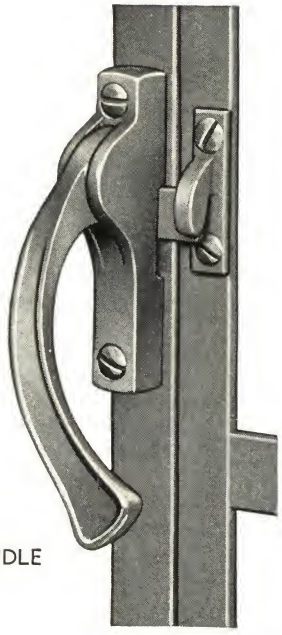
SURROUNDS HAVE MITRED OVERLAPPING JOINTS. ABSOLUTELY NO CUTTING OR FITTING IS REQUIRED ON THE JOB.



THEY ARE DESIGNED WITH A GROOVE INTO WHICH FLANGE OF SECTION FITS, AND WHEN SASH ARE POINTED WITH MASTIC THIS FEATURE ASSURES ABSOLUTE WEATHERTIGHTNESS.

STANWIN SCREENED CASEMENTS

THE Stanwin Screened Casement is the result of careful study and experimentation, directed toward producing a compact unit, combining beauty and utility. The screen is available in either steel or bronze with antique bronze cloth. The rigid frame lies perfectly flat against the casement and, having a beveled return to the screen cloth, does not provide a ledge for dust. It is held securely on the casement by the hardware brackets at the bottom, and by two clips near the top. Complete operation of the casement—opening, closing, and locking—is accomplished without moving the screen. For cleaning windows or storage purposes, the screen is quickly removed and readily replaced.



The very simplicity that gives easy operation contributes to the attractiveness of the fittings, which were created to conform with the generally accepted design of casement hardware. The fitting at the sill not only serves to operate the window but also holds it open in any desired position by thumb screw adjustment; and, in addition, by engaging it in the bracket rest when the window is closed, the casement is effectually locked. A handle of pleasing appearance, engaging in a beveled strike plate, pulls the sections snugly together, insuring perfect wind and weather tightness.

SILL OPERATOR

Operators are die cast with bronze slide bar and have no mechanical parts that will loosen with normal usage. They are designed for attaching to the frame without cutting away the sections and risking air infiltration.

The locking handle is attached to the outer frame with sufficient clearance for trim and plaster. Note that the window sections are not cut any place to accommodate the handle, so none of the weathering of the casement is lost.

DETROIT STEEL PRODUCTS COMPANY

Factories: Detroit, Michigan, Cleveland, Ohio and Oakland, California
General Offices: 2250 East Grand Boulevard, Detroit, Michigan
Local Offices in 217 Cities

(Member Solid Section Steel Window Industry)

FENESTRA ARCHITECTURAL SERVICE

TO ASSIST the architect in visualizing Fenestra Windows as they actually will appear in the building he is designing, Detroit Steel Products Company maintains an Architectural Service Department with architects trained in the correct use of Fenestra in monumental structures.

Without charge or obligation to you, this department will be glad to work up drawings showing exactly how Fenestra Windows may be detailed into the type of construction you are using and made to harmonize with your own architectural design.

It has been our privilege to work with some of the largest architects in the country with very gratifying results. Sometimes we are able to indicate a saving through the use of standard types. Almost always there are problems of appearance, arrangement of ventilators, amount of light or ventilation, on which our knowledge of steel window application to architectural requirements is helpful.

The men in the Architectural Service Department all know how to use a pencil. They talk an architect's own language. They are not salesmen. Their service is available for the asking. A word to your local Fenestra representative or to the Home Office at Detroit will enlist their immediate co-operation.

FENESTRA "FENMARK" WINDOWS

SPECIFICATIONS

1 GENERAL

1a ALL windows shall be Fenestra "Fenmark" as manufactured by Detroit Steel Products Company.

2 MATERIAL AND CONSTRUCTION

2a FRAME sections shall have a minimum depth of 1½" from front to back and shall be designed with equal or unequal legs as specified. Frame and ventilator sections shall be of hot rolled, solid steel, providing continuous, two-point, flat weathering contact between ventilators and frames.

2b ALL sections shall be re-rolled cold to make them true and straight and shall be individually electrically tested, for straightness.

2c FRAMES shall be mortise and tenon, air hammer riveted and electrically welded at all corners. Swing leaves shall be mitered at all corners and electrically welded. All welds shall be ground to a smooth finish.

(Mullions or transom bars are provided between adjacent units where specified.)

(Heavy, electro-galvanized steel head drip is supplied above all swing leaves.)

(Sill and jamb anchor clips with bolts for attachment to frame are supplied where required.)

3 ATTACHED HARDWARE

3a ALL side hung swing leaves shall open out on two heavy friction hinges of solid rolled, sherardized steel with heavy re-entrant angle fillets. Each hinge shall be equipped with two friction washers. Washers and hinge members shall be held by lock washers and bronze studs with acorn nuts, so that friction may be increased or decreased by adjusting the nut.

3b PROJECTING open-in ventilators shall be supported by two heavy, spring steel arms on steel brackets, double riveted to the vertical members. Each ventilator shall be hung on two brass, sliding U-shaped shoes riding inside the jamb sections, tension being retained by two coil springs completely enclosed in brass housings. Ventilators to tilt in at the top while sliding up from the bottom.

(In projecting open-out ventilators, the action is reversed.)

3c AN ornamental locking handle bracket of solid rolled steel, shall be electrically welded to the stile of each open-out swing leaf.

3d BRASS strikes and wrought steel keepers shall be supplied attached to the window frame as required.

4 DETACHED HARDWARE

4a ALL locking handles shall be U. S. Government specification solid bronze, of ornamental design and coinage finish, obtained without the use of plating or chemicals and equipped with friction springs, (or) same equipped with friction clevices.

(Swing leaf handles 1119 or 699. Sill ventilator handles 1122 or 1071. Special hardware at extra cost.)

4b SWING leaf operating hardware shall consist of a finger pull solidly attached to the sill of each swing leaf (used with friction hinges when specified) (or) solid bronze thumb screw operator (with non-friction hinges).

(Finger pull 1130 or 1230. Thumb screw operator 1101 or 203.)

4c PROJECTED open-out ventilator hardware shall consist of a solid bronze pole ring at the head of the ventilator and a solid bronze locking handle equipped for pole operation at the sill.

(Pole ring 151. Handle 1214 or 914.)

4d PROVIDE solid bronze handle for all projecting open-out transoms and a solid bronze automatic spring catch for all projecting open-in transoms.

(Transom handles 733 or 914. Spring catch 739.)

5 PAINTING

5a ALL windows shall be given one dip coat of gray lead and oil paint at the factory.

(Provide for an additional coat of paint by the painting contractor after erection of windows and before glazing. Final painting should be deferred until three weeks after glazing to permit putty to set. Where desired, Fenestra Construction Co. will do field painting under a separate contract.)

6 ERECTION

6a THE window manufacturer shall erect all windows, caulk with mastic and form a weather-tight union between window frames and mullions or transom bars. Caulking, at head or jambs, where windows abut the building construction, shall be supplied and applied by others, after erection. Sill caulking to be supplied by window manufacturer.

(Include in the masonry specifications that all masonry openings shall be constructed in accordance with Fenestra installation details so that the windows may be installed after masonry is completed. Also include in the masonry specifications that all mortar grouting, pointing, etc., shall be done by the mason contractor after the windows have been erected.)

7 GLASS AND GLAZING

7a ALL glass shall be bed puttied and face puttied, and further secured by copper-plated spring glazing clips supplied by the window manufacturer.

(Putty should be a high grade, quick-setting steel window putty. Ordinary wood window putty cannot be used. Glass should be ⅛" or ¼" plate. Single or double strength glass is not recommended. Glass and glazing labor supplied by Fenestra Construction Co. if desired, under a separate contract.)

8 SHADING

(All shades must be located at least 2½" from the inside face of the window to clear hardware. Each "Fenmark" window is drilled at both jambs near the head for the attachment of standard shade brackets.)

9 METAL STOOLS, SUBFRAMES

(Metal stools and rolled steel or pressed metal subframes can be supplied if specified. Consult nearest Fenestra office.)

PROJECTED "FENMARK" WINDOWS

SPECIFICATIONS

1 GENERAL

1a ALL windows shall be Fenestra Projected "Fenmark" as manufactured by Detroit Steel Products Company.

2 MATERIAL AND CONSTRUCTION

(*Same as "Fenmark" windows 2a, 2b, 2c, except that head drip is unnecessary and, therefore, not supplied.*)

3 ATTACHED HARDWARE

3a ALL ventilators shall be designed to slide down from the top while swinging out from the bottom (or) tilt in from the top while sliding up from the bottom. Each ventilator shall be supported by two heavy, spring steel arms, on steel brackets, double riveted to the vertical members, and shall be hung on two brass, U-shaped shoes, sliding in the jamb sections. Tension shall be retained by two coil springs, completely enclosed in brass housings.

3b VENTILATORS where specified shall be so designed and arranged that all glass may be washed on the outside from within the building.

(*Handle brackets, strikes and keepers are the same as in "Fenmark" windows.*)

3c EACH open-out ventilator shall be equipped with two shouldered, alignment-control, bronze springs, riveted to the channel jambs.

(*The shoulders of these springs are so designed and located as to limit the downward travel of the friction shoes and stop all open ventilators in uniform alignment of approximately 45 degrees. When it is desired to open the ventilator to a greater angle for washing, light pressure on the springs permits the friction shoes to slide past. As the ventilator returns to a closed position, the action of the springs is automatic.*)

4 DETACHED HARDWARE

4a ALL locking handles shall be U. S. Government specification solid bronze, of ornamental design and coinage finish, obtained without the use of plating or chemicals, and shall be equipped with friction clevices.

(*Open-out ventilator handles 733 or 914.*)
(*Open-in ventilator handle 1071.*)

4b VENTILATORS out of reach from the floor shall be equipped with solid bronze pole rings or spring catches except where mechanical operator is specified.

(*Pole ring 151. Spring catch No. 739.*)

5 PAINTING, ERECTION

(*Same as "Fenmark" windows 5 and 6.*)

6 GLASS, GLAZING, SHADING

(*Same as "Fenmark" windows 7 and 8.*)

7 SCREENS

(*Screens can be supplied where specified. Consult the nearest Fenestra office.*)

8 METAL STOOLS, SUBFRAMES

(*Metal stools and rolled steel or pressed metal subframes can be supplied where specified. Consult the nearest Fenestra office.*)

SCREENED "FENMARK" WINDOWS

SPECIFICATIONS

1 GENERAL

1a ALL windows shall be Fenestra Screened "Fenmark" as manufactured by the Detroit Steel Products Company.

2 MATERIAL AND CONSTRUCTION

(*Same as "Fenmark" windows—2a, 2b, 2c.*)

3 ATTACHED HARDWARE

3a ALL side hung swing leaves shall open out on two heavy (cleaning) hinges of solid rolled, sherardized steel with heavy re-entrant angle fillets. Hinge pins shall be solid bronze accurately fitted into flanged bronzed bushings.

3b PROJECTING open-in ventilators shall be supported by two heavy, spring steel arms, on steel brackets, double riveted to the vertical members. Each ventilator shall be hung on two brass, U-shaped shoes, riding inside the jamb sections, tension being retained by two coil springs completely enclosed in brass housings. Ventilators to tilt in at the top while sliding up from the bottom.

(*In projecting open-out ventilators, the action is reversed.*)

3c BRASS strikes and wrought steel keepers shall be supplied attached to the window frame as required. Provision for screen attachment and operator attachment shall be included.

4 DETACHED HARDWARE

4a LOCKING handles and handle brackets together with all operators shall be so designed that each swing leaf may be opened, closed and locked through the screen but without touching it. Locking handle bracket shall be ornamental in design, accommodating and entirely concealing the locking cam.

4b LOCKING handles shall be U. S. Government specification solid bronze, of ornamental design and coinage finish, obtained without the use of plating or chemicals and equipped with concealed coil springs (or) solid bronze with oxidized finish.

(*Swing leaf handle 1222 or 1023. Sill ventilator handle 1122 or 1223.*)

4c EACH swing leaf operator shall consist of a bronze arm, bronze locking lever and bronze or alloy housing so designed as to operate through the screen but without touching it and open or close the swing leaf or hold it in any desired position.

(*Swing leaf operator 1216 or 1133.*)

4d PROVIDE solid bronze adjuster for all projecting open-out transoms, and a solid bronze automatic spring catch for all projecting open-in transoms.

(*Open-out adjuster 1108. Spring catch No. 739.*)

5 PAINTING, ERECTION

(*Same as "Fenmark" windows 5 and 6.*)

6 GLASS, GLAZING, SHADING

(*Same as "Fenmark" windows 7 and 8.*)

7 SCREENS

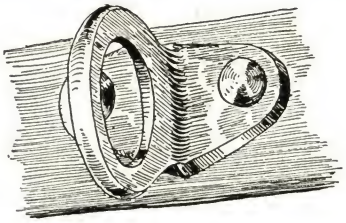
7a SCREENS for swing leaves and projected open-out transoms shall set flat against the inside of the frame, with handles and adjusters extending through the screens, so that each window may be opened, closed and locked through the screen but without touching it.

7b SCREENS for projected open-in ventilators shall set flat against a screen guide outside the frame and shall be equipped with fasteners so designed that the screens may be readily hung or removed from inside the building.

7c SCREEN frames shall be cold-rolled, rust-proof steel (or bronze) containing a reinforcing brace running the full length of the stile. Steel frames shall be painted two coats of grey lead and oil, baked on. Screen cloth shall be 16-mesh bronze wire. Each screen shall be provided with a 22-gauge steel (or bronze) escutcheon with circular hole to fit over and around the locking handle.

(*Bronze frames or steel frames with bronze cap, or screens with finer than 16-mesh cloth can be supplied at slight extra cost.*)

8 METAL STOOLS, SUBFRAMES



(*Metal stools and rolled steel or pressed metal subframes can be supplied where specified. Consult the nearest Fenestra office.*)

FENESTRA "FENCRAFT" CASEMENTS

SPECIFICATIONS

1 GENERAL

1a ALL windows shall be Fenestra "Fencraft," as manufactured by Detroit Steel Products Company.

2 MATERIAL AND CONSTRUCTION

2a FRAME sections shall have a minimum depth of 1¼" from front to back. Frames and swing leaves shall be of hot rolled, solid steel providing continuous, two-point, flat weathering contact between swing leaves and frame and shall be further weathered by baffles at both inner and outer contacts.

2b ALL sections shall be rerolled, cold, to make them true and straight and shall be individually electrically tested for straightness.

2c FRAMES and swing leaves shall be mitered at all corners and electrically butt welded. All welds shall be ground to a smooth finish.

(Mullions or transom bars are provided between adjacent units as specified.)

(Heavy, electro-galvanized steel drip is supplied over all swing leaves.)

(Sill and jamb anchor clips with bolts for attachment to frame are supplied where required.)

3 ATTACHED HARDWARE

3a ALL side hung swing leaves shall open out on two heavy, friction (cleaning) hinges of solid rolled, sherardized steel with heavy reentrant angle fillets. Each hinge shall be equipped with two friction washers. Washers and hinge members shall be held by lock washers and bronze studs with acorn nuts so that by adjusting the nuts, friction may be increased or decreased.

3b ALL top hung, open-out transoms and all bottom hung, open-in transoms shall be hung on heavy, flush, sherardized, wrought steel hinges with bronze hinge pins. Open-in transoms shall be supported by two bronze, friction side arms with friction shoes moving in bronze channels attached to the frame members.

3c EACH side hung swing leaf shall have an ornamental locking handle bracket of solid rolled steel, electrically welded to the swing leaf stile.

3d BRASS strikes and wrought steel keepers shall be supplied, attached to the window frame as required.

4 DETACHED HARDWARE

4a ALL locking handles shall be: (1) U. S. Government Specification solid bronze of ornamental design and coinage finish obtained without the use of plating or chemicals and equipped with friction springs, or (2) same, equipped with friction clevices, or (3) oxidized bronze with friction clevices.

(Handles 1119, 699 or 198.)

4b SWING leaf operating hardware shall consist of a finger pull solidly attached to the sill of each swing leaf (used with friction hinges where specified) or a solid bronze thumb screw operator (with non-friction hinges).

(Finger Pull 1130 or 1230. Operator 1101 or 203.)
(Double Locking Device in bronze only, where specified, at added cost.)

4c PROVIDE solid bronze peg and stay for all top hung, open-out transoms and a solid bronze, automatic spring catch for all open-in transoms.

(Peg and Stay 1110. Spring Catch 739.)

5 PAINTING

5a ALL casements shall receive one coat of rust resisting primer and one coat of gray lead and oil paint at the factory—each coat to be sprayed on and baked separately.

(Provide for additional coat of paint by the painting contractor after erection of windows and before glazing. Final painting should be deferred until three weeks after glazing to permit putty to set. Where desired, Fenestra Construction Co. will do field painting under a separate contract.)

6 ERECTION

6a ALL casements shall be erected plumb and true and caulked with mastic to form a weather-tight union between window frames and mullions, transom bars or building construction. All hardware shall be applied in accordance with manufacturer's instructions.

(Mastic is supplied—3 lbs. to each 10 lineal feet of perimeter.)
(Include in the masonry specifications, that all masonry openings shall be constructed in accordance with Fenestra installation details so that the windows may be installed after the masonry is completed. Also include that all mortar grouting and pointing shall be done by the mason contractor after the windows have been installed.)

7 GLASS AND GLAZING

7a ALL glass shall be bed puttied and face puttied and further secured by copper-plated, spring glazing clips furnished by the window manufacturer.

(Putty should be high grade, quick setting, steel window putty. Ordinary wood window putty cannot be used. Glass should be ⅛" or ¼" plate. Single or double strength glass is not recommended. Glass and glazing labor is supplied by Fenestra Construction Co. under separate contract if desired.)

8 SHADING

(All shades must be located at least 2½" back from the face of the window to clear hardware. Each casement is drilled at both jambs near the head for the attachment of standard shade brackets.)

9 METAL STOOLS AND SUBFRAMES

(Metal stools and rolled steel or pressed steel subframes can be supplied if specified. Consult the nearest Fenestra office.)

10 FRENCH DOORS

(For use with "Fencraft" and "Screened Fencraft" Casements, Fenestra French Doors of similar design, quality and workmanship can be supplied in standard sizes, where specified. Shop drawings are submitted for the architect's approval before fabrication.)

(By the use of mullions, doors may be combined with side lights and transoms to fill door openings of various sizes.)

(Doors can be made to open in or out. Open-out doors have a heavy, electro-galvanized drip at the head.)

(Open-in doors have a heavy, non-corrosive, extruded drip at the sill. All doors have a double kick plate in the lower panel with wood inserted between 16-gauge steel sheets as a sound deadener. All doors have bronze hinges and pins and extruded bronze thresholds. The active leaf of each door is equipped with a solid bronze locking handle operating a concealed, bronze cremone bolt which actuates three locking bolts. Shot bolts are provided on the opposite leaf. A dead lock is provided to lock the doors from the inside. All doors are glazed from the outside.)

(Screens for French Doors are not supplied by Detroit Steel Products Co.)

"FENCRAFT" OPEN-IN CASEMENTS

SPECIFICATIONS

1 GENERAL

1a ALL windows shall be Fenestra "Fencraft" Open-In Casements as manufactured by Detroit Steel Products Company.

(Standard Types of "Fencraft" Open-In Casements are 2214 Bottom Hung and CH 2. Also 22, 2214 R-L, 23, 2316 R-L, 24, 2418 R-L, 25, 25-1-10 R-L, as shown on Plate A 515.)

(Top hung open-out transom units may be used in combination with open-in casement units if desired.)

2 MATERIAL AND CONSTRUCTION

(Same as "Fencraft" Casements 2a, 2b, 2c, except that Heavy electro-galvanized steel drip is supplied at the sill of all side hung swing leaves.)

3 ATTACHED HARDWARE

3a HINGES for side hung swing leaves and for top hung open-out transoms and bottom hung open-in transoms shall be heavy, flush, sherardized, wrought steel with bronze hinge pins.

3b LOCKING handle bracket shall be solid rolled steel of ornamental design, electrically welded to the swing leaf stile.

4 DETACHED HARDWARE

4a ALL locking handles shall be (1) U. S. Government specification, solid bronze, of ornamental design and coinage finish obtained without the use of plating or chemicals and equipped with friction springs, or (2) same equipped with friction clevices.

(Handles 1119 or 1299. Double locking device in bronze where necessary at added cost.)

4b PROVIDE solid bronze peg and stay for all top hung open-out transoms and solid bronze automatic spring catch for all bottom hung open-in transoms.

(Peg and Stay 1110. Spring Catch 739.)

4c PROVIDE bronze strikes and wrought steel keepers attached to the casement frame as required.

4d EACH side hung swing leaf and each bottom hung open-in transom shall be provided with flat type friction adjuster consisting of a solid bronze arm and sliding adjustable friction shoe moving in a bronze channel attached to the frame in such a manner as to be entirely concealed when the casement is closed.

(No other adjusters are necessary on "Fencraft" Open-In Casements.)

5 PAINTING

(Same as "Fencraft" Casements 5a.)

6 ERECTION

(Same as "Fencraft" Casements 6a.)

7 GLASS AND GLAZING

(Same as "Fencraft" Casements 7a.)

8 SHADING

(Care should be taken to attach shade and drapery brackets to the building construction in such a manner as to clear the open-in swing leaves. At extra cost, casements may be drilled in the field so that shades or glass curtains may be attached directly to the swing leaves. When this is done, jambs should be kept back 2" from the window on the inside to avoid fouling.)

9 METAL STOOLS AND SUBFRAMES

(Same as "Fencraft" Casements 9.)

10 SCREENS

SCREENS, where used, should be installed on the outside and should be kept 1½" from the face of the window to clear sill drip.

11 FRENCH DOORS

(Same as "Fencraft" Casements 10.)

SCREENED "FENCRAFT" CASEMENTS

SPECIFICATIONS

1 GENERAL

1a ALL windows shall be Fenestra Screened "Fencraft" Casements as manufactured by the Detroit Steel Products Company.

2 MATERIAL AND CONSTRUCTION

(Same as "Fencraft" Casements—2a, 2b, 2c.)

3 ATTACHED HARDWARE

3a ALL side hung swing leaves shall open out on heavy (cleaning) hinges of solid rolled, sherardized steel with heavy reentrant angle fillets. Hinge pins shall be solid bronze, accurately fitted into flanged bronze bushings.

3b ALL top hung, open-out transoms shall be hung on heavy, flush sherardized wrought steel hinges with bronze hinge pins.

(Bottom hung, open-in transoms are not supplied in Screened Fencraft Casements.)

3c EACH swing leaf shall be provided with a malleable iron keeper both riveted and welded to the swing leaf stile.

4 DETACHED HARDWARE

4a HANDLE brackets shall be ornamental die castings designed to accommodate and entirely conceal the locking cam and swing leaf keeper when the casement is closed.

4b ALL locking handles shall be equipped with lock washers and shall be: (1) U. S. Government specification solid bronze of ornamental design and coinage finish obtained without the use of plating or chemicals; or (2) solid bronze with oxidized finish.

(Handles 1222 or 1023.)
(Handles and handle brackets are assembled at the factory and are designed to be attached to the casement stile by concealed screws.)

4c ALL handles shall be designed with a hinge action to permit their slipping through screen escutcheons.

4d AN adjuster shall be provided at the sill of each casement so that the swing leaf may be opened and closed through the screen, but without touching it. Each adjuster shall consist of a solid bronze arm with fulcrum bracket, equipped with friction plate and thumb screw.

(Adjusters 1133 or 1216.)

4e ADJUSTER for top hung open-out transoms shall be of the notched stay type; (1) U. S. specification bronze or (2) solid bronze, oxidized;—designed to operate through the screen without touching it.

(Stay Adjuster 1108.)

5 PAINTING

(Same as "Fencraft" Casements 5a.)

6 ERECTION

(Same as "Fencraft" Casements 6a.)

7 GLASS AND GLAZING

(Same as "Fencraft" Casements 7a.)

8 SHADING

(Same as "Fencraft" Casements 8.)

9 METAL STOOLS, SUBFRAMES

(Same as "Fencraft" Casements 9.)

10 SCREENS

10a SCREENS shall set flat against the inside of the casement frame with locking handles and adjusters extending through the screens so that casements may be opened or closed or locked without touching the screens.

Screen frames shall be cold rolled, rust proofed steel containing a triangular reinforcing brace running the full length of the stile and shall be painted two coats of grey lead and oil, baked on. Screen cloth shall be 16-mesh oxidized bronze wire, held taut by a cap removable for rewiring. Each screen shall be provided with a 22-gauge steel escutcheon with circular hole to fit over and around the locking handle.

(Screens with bronze frames and escutcheon or with finer mesh may be had at extra cost.)

FENESTRA CASEMENT DOOR

WITH FENCRAFT & FENWROUGHT SIDELIGHTS

Plate No B-301

SCREENED "FENWROUGHT" CASEMENTS

SPECIFICATIONS

1 GENERAL

1a ALL windows shall be Fenestra Screened "Fenwrought" as manufactured by Detroit Steel Products Company.

2 MATERIAL AND WORKMANSHIP

2a FRAME sections shall have a minimum depth of 1" from front to back. Frames and swing leaves shall be hot rolled, solid steel, providing continuous, two-point, flat weathering contact between swing leaves and frame and shall be further weathered by baffles at both inner and outer contacts.

2b FRAMES and swing leaves shall be mitered at all corners and electrically butt welded. Welds shall be ground to a smooth finish.

(Mullions or transom bars are provided between adjacent units as specified.)

(Heavy, electro-galvanized steel drip is supplied over all swing leaves, coming to the head of the window.)

(Sill and jamb anchor clips with bolts for attachment to frame are supplied where required.)

3 ATTACHED HARDWARE

3a ALL side hung swing leaves shall open out on heavy extension (cleaning) hinges of special, solid rolled steel with heavy re-entrant angle fillets. Hinge pins shall be solid bronze accurately fitted into flanged bronze bushings.

3b ALL top hung open-out transoms shall be hung on heavy, flush, sherardized, wrought steel hinges with bronze hinge pins.

3c PROVIDE a locking handle bracket of heavy gauge steel plate stamped to special design and solidly attached to the frame section.

(On units with one swing leaf, the bracket is welded to the frame section. Specify whether leaf is desired left or right handed. Where window contains two swing leaves, the bracket is screwed to the vertical meeting rail.)

3d PROVIDE a specially rolled steel keeper welded to each swing leaf stile.

4 DETACHED HARDWARE

4a ALL locking handles shall be of ornamental design and shall be (1) malleable iron with dull black finish, or (2) solid bronze, coinage finish.

(Handle 1023.)

4b ALL handles shall be designed with a hinge action to permit their slipping through the screen escutcheon.

4c AN adjuster shall be provided at the sill of each casement so that the swing leaves may be opened and closed through the screen, but without touching it. Each adjuster shall consist of a solid bronze arm with fulcrum bracket and locking lever, coinage finish or oxidized.

(Through Screen Operator 1133.)

4d ADJUSTERS for top hung, open-out transoms shall be of the notched stay type designed to operate through the screen, but without touching it. Furnished in coinage or oxidized finish.

(Transom Stay 1108.)

5 PAINTING

5a ALL casements shall receive one dip coat of gray lead and oil paint by the manufacturer before shipment.

(Provide for additional coat of paint by the painting contractor after erection of windows and before glazing. Final painting should be deferred until three weeks after glazing to permit putty to set. Where desired, Fenestra Construction Co. will do field painting under a separate contract.)

6 ERECTION

6a ALL casements shall be set plumb and true and caulked with mastic to form a weather-tight union between window frames and mullions, transom bars or building construction. All hardware shall be applied in accordance with manufacturer's instructions.

(Mastic is supplied—1 lb. to each 10 lineal feet of perimeter.)

(Include in the masonry specifications that all masonry openings shall be constructed in accordance with Fenestra installation details so that windows may be installed after the masonry is completed. Also, include that all mortar grouting and pointing shall be done by the mason contractor after the windows have been installed.)

7 GLASS AND GLAZING

7a ALL glass shall be bed puttied and face puttied and further secured by copper plated, spring glazing clips furnished by the window manufacturer.

(Putty should be high grade, quick setting, steel window putty. Ordinary wood sash putty cannot be used. Glass should be 1/8" or 1/4" plate. Double strength recommended for small lights only. Single strength not recommended. Glass and glazing labor is supplied by the Fenestra Construction Co. under a separate contract, if desired.)

8 SHADING

(Each casement is drilled at both jambs near the head for the attachment of standard shade and drapery brackets which can be purchased from local interior decorators.)

9 SCREENS

9a FENESTRA Flat Screens: Screens shall be set flat against the inside of the casement frame with locking handles and adjusters extending through the screens so that casements may be opened, closed and locked without touching screens.

SCREEN frames shall be cold rolled, rust proofed steel containing a triangular reinforcing brace running the full length of the stile and shall be painted two coats of gray lead and oil baked on. Screen cloth shall be 16-mesh oxidized bronze wire held taut by a cap removable for rewiring. Each screen to

have a 22-gauge steel escutcheon to fit over and around the locking handle.

(Screens with bronze frame or finer mesh may be had at extra cost.)

10 FRENCH DOORS

(For use with "Fenwrought" and "Screened Fenwrought" Casements, Fenestra French Doors of similar design, quality and workmanship can be supplied in standard sizes, where specified. Shop drawings are submitted for the architect's approval before fabricating. See Plate B-301.)

(By the use of mullions, doors may be combined with side lights and transoms to fill door openings of various sizes.)

(Doors can be made to open in or out. Open-out doors have a heavy electro-galvanized drip at the head. Open-in doors have a heavy, non-corrosive, extruded drip at the sill. All doors have a double kick plate in the lower panel with wood inserted between 16-gauge steel sheets as a sound deadener. All doors have bronze hinges and pins. Extruded bronze thresholds may be had at extra cost.)

(The active leaf of each door is equipped with a solid bronze locking handle operating a concealed bronze cromone bolt which actuates three locking bolts. Shot bolts are provided on the opposite leaf. A dead lock is provided to lock the doors from the inside. All doors are glazed from the outside.)

(Screens for French doors are not supplied by Detroit Steel Products Co.)

FENESTRA "FENWROUGHT" CASEMENTS

SPECIFICATIONS

1 GENERAL

1a ALL windows shall be Fenestra "Fenwrought" as manufactured by Detroit Steel Products Co.

2 MATERIAL AND WORKMANSHIP

(Same as "Screened Fenwrought" 2a, 2b.)

3 ATTACHED HARDWARE

3a ALL side hung swing leaves shall open out on two heavy, friction, cleaning hinges of solid rolled, sherardized steel with heavy re-entrant angle fillets. Each hinge shall be equipped with two friction washers. Washers and hinge members shall be held by lock washers and bronze studs with acorn nuts so that by adjusting the nuts, the friction may be increased or decreased.

3b ALL top hung open-out transoms shall be hung on heavy, flush, sherardized, wrought steel hinges with bronze hinge pins.

3c PROVIDE ornamental locking handle brackets of special, solid rolled steel sections, welded to the swing leaf stiles.

3b BRASS strikes and wrought steel keepers shall be supplied, attached to the window frame as required.

4 DETACHED HARDWARE

4a ALL locking handles shall be ornamental in design and shall be (1) Specification Bronze, Coinage Finish, (2) Solid Bronze Oxidized, (3) Iron with dull black finish.

(Handles 198 or 699.)

4b WHERE friction hinges are used, no sill operating hardware is necessary. Where non-friction hinges are used operators shall be: (1) Sliding Stay; (2) Peg and Stay; (3) Friction Stay; (4) Gear Type Underscreen.

(Sliding Stay 612; Peg and Stay 209; Friction Stay 203; Underscreen 385.)

4c FOR top hung transoms, provide Peg and Stay operator in wrought iron with dull black finish or in solid bronze, at extra cost.

(Transom Stays 747 or 1034.)

5 PAINTING

(Same as "Screened Fenwrought" 5.)

6 ERECTION

(Same as "Screened Fenwrought" 6.)

7 GLASS AND GLAZING

(Same as "Screened Fenwrought" 7.)

8 SHADING

(Shade and drapery brackets should be attached to the building construction, 2½" back from the face of the window to clear the hardware.)

9 SCREENS

9a SCREENS shall be: (1) Fenestra Swing Screens; (2) Fenestra Chamberlin Roll Screens.

(Fenestra Swing Screens are of cold rolled steel, welded into tubes, mitered at the corners and butt welded. The entire screen is bonderized after assembly and painted with gray enamel, baked on. Screen cloth is 16-mesh oxidized bronze wire. All fittings are brass except pivot brackets which are parkerized steel.)

(All screens set flat against the inside of the casement frame and swing on brass studs at top and bottom. Easily removed. Rewireable if desired.)

(Fenestra Chamberlin Roll Screens consist of 16-mesh, antique finish, bronze wire cloth carried on a spring roller of steel tubing, the whole encased in an electro-plated, steel case. This case is attached at the head of the window or the head of the swing leaf, the screen cloth unrolling downward, guided by electro-plated steel guides, attached to the jambs.)

(When pulled down to the sill, the screen locks automatically in position. In opening, light pressure on the locks on either side releases the screen which is immediately wound up on the spring roller.)

(Guides, roll case, operating bar and all exposed parts are oxidized copper color and lacquered. Screens are rewirable when necessary.)

(Screens with finer than 16-mesh cloth may be had at extra cost.)

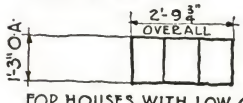
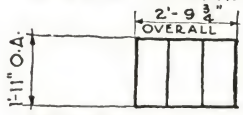
FENESTRA "BASEMENT" WINDOWS

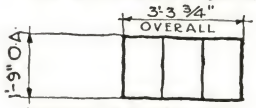
SOLD EXCLUSIVELY THROUGH DEALERS



CAM ACTING LOCK AT THE SILL

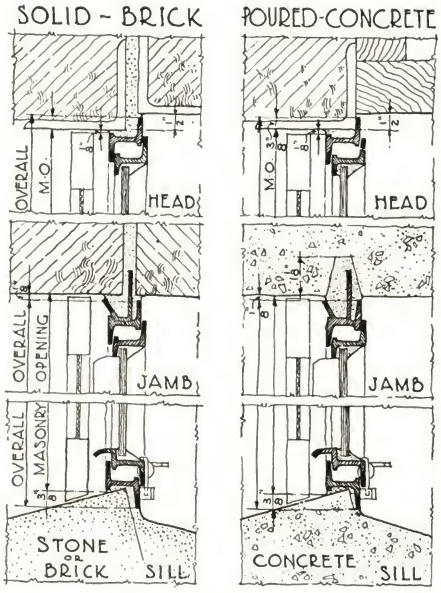


TYPES AND SIZES

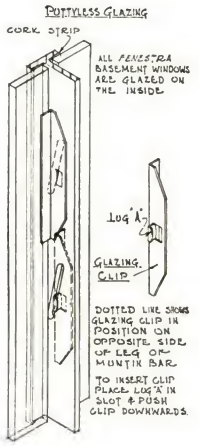


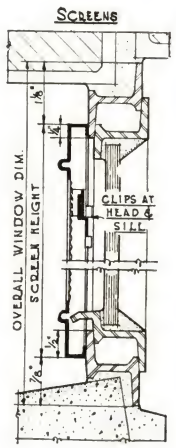
IN CONCRETE BLOCK CONSTRUTCTION FITS OPENING TWO BLOCKS WIDE BY THREE BLOCKS HIGH WITH A TROWELED SILL

FOR HOUSES WITH LOW GRADE LINE WORKS OUT EXCEPTIONALLY WELL IN BRICK CONSTRUCTION



FOR HOUSES WITH A HIGHER GRADE LINE WORKS OUT WELL IN BRICK OR CONCRETE BLOCKS

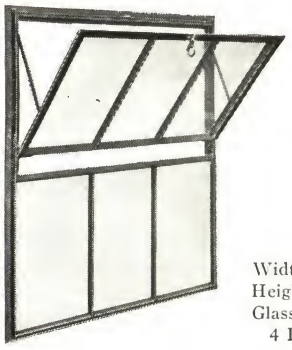




WORKS OUT WELL WITH EITHER BRICK OR CONCRETE BLOCK AND IS THE WINDOW MOST USED IN THE AVERAGE TYPE OF CONSTRUCTION

CAM ACTION LOCK

Cam action lock at sill. Hinges of substantial hook design make sash easily removable. Sill and jambs of frame in one continuous piece mitered and welded at corners. Jamb fins, spot welded to frame, provide solid anchorage.



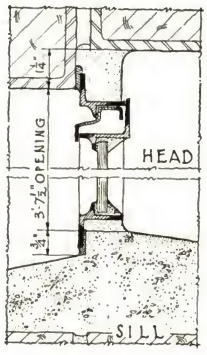
PUTTYLESS GLAZING

At slightly increased cost Fenestra Basement Windows may be obtained with angle glazing clips which hold the glass securely against cork cushion strips, rendering putty unnecessary. See details above.

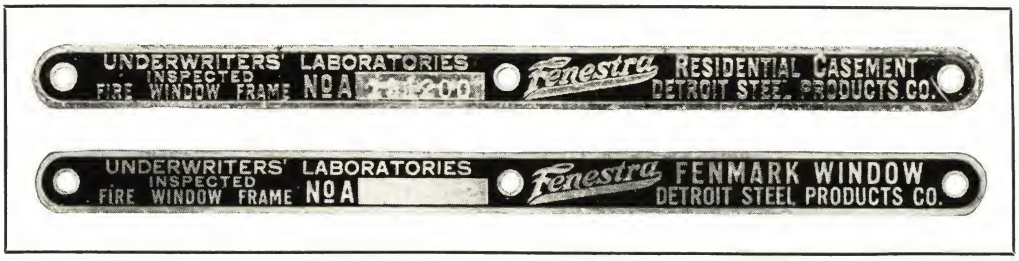
SCREENS AND WIRE GUARDS

Metal-framed, bronze-mesh screens, with or without wire guards, available at extra cost. See details above.

FENESTRA "UTILITY" WINDOWS



Width, 3′ 4½″
Height, 3′ 7½″
Glass, 2 Lts. 13″x20″; 4 Lts. 12″x20″



The Fenestra Utility Window is specially designed for small buildings, such as private garages, filling stations, shops, stores and basements high above the grade; also for barns, granaries, implement sheds, poultry and hog houses.

It offers all the advantages of steel window construction: more daylight and ventilation, greater ease of operation, protection against fire, theft and the weather. When closed, a spring catch automatically locks the ventilator.

Handily installed in all types of construction, the Fenestra Utility Window fits concrete block exactly—2½ blocks wide and 6 blocks high—with a sill.

UNDERWRITERS' WINDOWS

The following outside putty glazed Fenestra Windows can be furnished bearing the label of the Underwriters' Laboratories, Inc.:

FENMARK AND SCREENED FENMARK WINDOWS

All standard types and sizes may be labeled subject to the restrictions below. Multiples of these types may be used to fill openings up to 9′ wide, by bolting together two or more units having interlocking jamb bars, and to fill any width opening by the use of T-bar mullions.

Units can contain ventilators of the side-hung open-out type with friction or non-friction hinges, or a combination of side-hung open-out ventilators and projected-out ventilators.

Side-hung ventilators are limited to 54″ high. Projected-out ventilators can be introduced where fixed lights or projected-in ventilators are shown.

Locking hardware may be either iron or bronze. Operating hardware may be any of the types standardized for commercial use.

All glass must be ¼″ wire, panes being limited to an exposed area of 350 sq. in. by the introduction of vertical and horizontal muntins. Glass to be held by special coppered steel wire clips and putty.

FENMARK PROJECTED WINDOWS

All standard types and sizes may be labeled subject to the restrictions below. Multiples of these types may be used to fill openings up to 9′ wide by bolting together two or more units having interlocking jamb bars, and to fill any width opening by the use of T-bar mullions.

Ventilators must be of the projected-out type. Hardware may be either bronze or iron.

All glass must be ¼″ wire, panes being limited to an exposed area of 350 sq. in. by the introduction of vertical and horizontal muntins. Glass must be held by special coppered wire clips and putty.

FENCRAFT AND SCREENED FENCRAFT CASEMENTS

All standard types and sizes, exclusive of curved heads, may be labeled subject to the restrictions below.

Height of any unit is restricted to 6′6″. Ventilators may be of the side-hung type with friction or non-friction hinges, or top-hung, open-out type. Side-hung ventilators are limited to 54″ high.

Locking hardware may be either bronze or iron. Operators may be any of the types standardized for commercial use.

Glass must be ¼″ wire with an exposed glass area limited to 350 sq. in. Glass must be held by special coppered wire clips and putty.

FENWROUGHT AND SCREENED FENWROUGHT CASEMENTS

All standard types and sizes, with the exception of curved heads, may be labeled subject to the restrictions below.

Ventilators may be of the side-hung type with friction or non-friction hinges, or of the top-hung, open-out type. Locking hardware may be of either iron or bronze. Operators may be of the types standardized for commercial use. Glass must be ¼″ wire with exposed area limited to 200 sq. in. by the introduction of vertical and horizontal muntins. Glass must be held by special coppered wire clips and putty.

INDUSTRIAL WINDOWS

The following Fenestra Windows, inside glazed with glazing angles, can be supplied bearing the label of the Underwriters' Laboratories, Inc.

All standard types and sizes having over-all dimensions not in excess of 7′x12′ may be labeled subject to restrictions below. (Either dimension may be used as width or height.) Multiples of these sizes may be used to fill any width opening by use of T-bar mullion provided width between mullions is 7′ or less, and provided area is 84 sq. ft. or less.

Ventilators may be pivoted 2″ above center or 4″ down from top to open out or may be of projected open-out type. Total ventilator area limited to 3,000 sq. in.

All ventilators must be operated separately. Ventilators pivoted 2″ above center may have cam and chain or cam and stay operators. Ventilators pivoted 4″ from the top must have cam and stay operators. Projected ventilators may have standard operators of either cam handle or kickout type, in either bronze or iron with chain or pole operation.

All glass must be ¼″ wire and is limited to 48″ in either width or height and a total exposed area of not over 350 sq. in. Glass to be held by $\frac{7}{16}$x$\frac{5}{8}$″, 16-gauge pressed steel angles tapped to outside frame and ventilator bars and bolted through all muntin bars.

FENESTRA PIVOTED WINDOWS

SPECIFICATIONS

Notes are explanatory only and need not be included in the specifications.

GENERAL

HORIZONTALLY PIVOTED WINDOWS shall be Fenestra as manufactured by the Detroit Steel Products Company.

MATERIAL

All sections shall be especially designed, hot rolled, solid steel bars with heavy fillets in all re-entrant angles.

All frame members shall be special angle sections.

MUNTINS shall be especially formed T sections.

MULLIONS AND TRANSOM BARS shall be standard Fenestra, hot rolled, solid steel T sections.

(Note:—Use mullions where two or more windows are used side by side in the same opening. Use transom bars where two or more windows are used one above another. Horizontal structural mullions are not furnished by the window manufacturer.)

CONSTRUCTION

FRAMES AND VENTILATORS shall be mortise and tenon, air hammer riveted at all corners. Provide continuous two-point, flat-contact weathering between ventilators and frames.

MUNTINS shall be continuous from head to sill and from jamb to jamb, so interlocked as to increase their strength at the point of intersection. Joints at frames shall be mortise and tenon, air hammer riveted.

(Note:—All structural steel is furnished by others. Include in the steel specifications all punching to accommodate clips. Where masonry will interfere with installation of clips at time windows are erected, provide that all clip bolts be included and attached by steel contractor.)

ATTACHED HARDWARE

(Note:—Attach at the factory.)

All ventilators shall be horizontally pivoted and supported by external adjustable, special solid rolled steel butts, double machine riveted through window bars and weathering.

(Note:—Butts are set 2" above center unless otherwise specified. They may be set 4" below top of ventilator. If desired, so specify.)

All butts shall have 5/8" solid steel bolts equipped with washers and nuts; each pin shouldered to insure constant, free and easy ventilator operation.

All ventilators shall be provided with solid rolled steel Z bar brackets, triple machine riveted to ventilator sill for attachment of operating hardware.

DETACHED HARDWARE

Provide malleable iron cam latches and rolled steel stay bars or malleable iron latches, chain, chain catches and pulley brackets.

(Note:—For group operation of ventilators see Fenestra Mechanical Operating Devices.)

ERECTION

(Note:—Include in the Masonry Specifications that all masonry openings shall be accurately constructed in accordance with standard Fenestra installation details so that windows may be erected in prepared openings.)

(Note:—Include in the Masonry Specifications that all mortar grouting, pointing, etc., shall be done by the mason contractor after the windows are erected.)

All windows shall be erected in prepared openings by the Fenestra Construction Company under a separate contract.

All windows shall be set plumb and true, properly aligned and securely anchored before glazing.

Standard Fenestra sill anchors (2 for windows up to 6'6" wide; 4 for windows over 6'6" wide) shall be used: if the ventilator comes to the sill of the window; if the window is over 5'0" wide; in all multiple unit openings where the mullions are not anchored into the sills.

PAINTING

All windows shall be given one dip-coat of red mineral paint by the manufacturer before shipment.

(Note:—Include in the Painting Specifications that all windows should be given one additional coat after erection but before glazing. Further painting should be deferred until at least three weeks after glazing, to allow putty to set.)

(Note:—Where desired, Fenestra Construction Company, at reasonable added cost, will do field painting after erection. If desired, so specify including specification of paint and its application.)

GLASS AND GLAZING

(Note:—Include in the Glazing Specifications that glass sizes are to be either 12" x 18" or 14" x 20" but ventilator lights which abut on top, sides, or bottom of the ventilator must be trimmed 1" along the abutting edge.)

Glass shall be 1/4" rough wire, 1/4" factory ribbed, 1/8" factory ribbed, double strength.

(Note:—1/4" glass is recommended. Single strength glass is not recommended.)

Putty shall be a high grade of steel window putty.

(Note:—Ordinary wood sash putty must not be used.)

All windows shall be glazed from the inside, all glass being set in a bed of putty and secured by copper plated, steel spring glazing clips furnished by the window manufacturer. (4 clips to each fixed light; 6 clips to each ventilator light.)

Face putty shall be applied in a neat, clean-cut smooth manner.

(Note:—Do not paint until putty has thoroughly hardened.)

SCREENS

(Note:—Screens are not furnished by the window manufacturer but special metal screens may be had so arranged that the upper half of the screen is outside the ventilator, the lower half, inside.)

Fenestra, August 1929	Horizontally Pivoted Windows Camber and Semi-Circular Heads	Plate No. L-109

FENESTRA PROJECTED WINDOWS

COMMERCIAL TYPE — SPECIFICATIONS

GENERAL

Windows shall be Fenestra Commercial Projected as manufactured by Detroit Steel Products Company.

MATERIAL—CONSTRUCTION

(Note:—Same as these specifications for Fenestra Horizontally Pivoted Windows.)

ATTACHED HARDWARE

(Note:—Attach at the factory.)

Ventilators shall swing out from the bottom while sliding down from the top or swing in from the top while sliding up from the bottom, as indicated.

Each ventilator shall be accurately balanced on two supporting arms of solid spring steel attached to the ventilator with bronze shoulder pivots, equipped with bronze washers. Connections between supporting arms and window frame shall be made by malleable iron brackets rigidly supported on the horizontal frame members or muntins and double riveted to the vertical frame members or muntins with arms attached by bronze shoulder pivots.

Each ventilator shall be equipped with two channel shaped bronze friction shoes sliding vertically in the ventilator jambs and so constructed that through galvanized compression springs uniform tension is secured. Shoes shall be accurately gauged and located and solidly riveted in place to assure proper, constant pressure at the jambs.

Each *open-out* ventilator shall be equipped with two shouldered, alignment control bronze springs riveted to the channel jambs.

(Note:—The shoulders of these springs are so designed and located as to limit the downward travel of the friction shoes and stop all open ventilators in uniform alignment of approximately 60 degrees. When it is desired to open the ventilator at a greater angle or reverse for washing, light pressure on the springs depresses the shoulders and allows the friction shoes to slide past. As the ventilator is returned to a closed position, the action of the spring is automatic.)

Each *open-in* ventilator shall be equipped with a solid steel stop which prevents its opening farther than 90°

DETACHED HARDWARE

All hardware shall be (malleable iron) (bronze).

(Note:—Bronze at added cost over iron.)

Locking and Operating Devices.

(1) *For open-out ventilators within reach from floor*—Malleable iron cam handle attached to Z bar bracket by bolt and nut, Part 150.

(2) *For open-out ventilators beyond reach from floor*—Riveted malleable iron pole ring at head of ventilator, malleable iron cam handle.

(3) *For open-in ventilators within reach from floor*—Riveted malleable iron spring latch with finger ring handle at head of ventilator, Part 147.

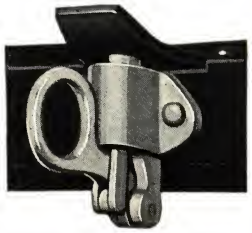
(4) *For open-in ventilators beyond reach from floor*—Riveted malleable iron spring latch with endless chain, Part 146, at head of ventilator. Riveted iron chain guide, at sill, or riveted malleable iron spring latch with pole hook ring handle, Part 147, at head.

ERECTION—PAINTING—GLAZING

(Note:—Same as these specifications for Horizontally Pivoted Windows.)

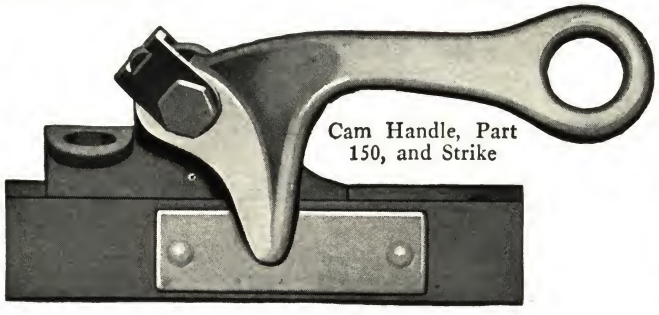
PROVISIONS FOR SCREENS

(Note:—Include in the Carpentry Specifications the necessary clauses covering wood trim required in conjunction with screens. Space between inside screen and window must not be less than 2" to clear standard hardware.



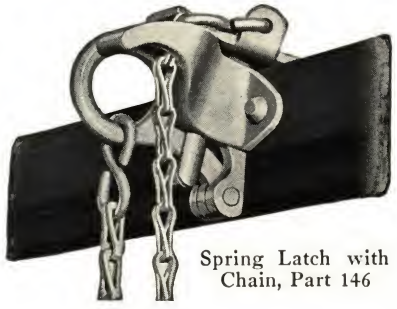
SCREENS AND SHADES

(Note:—On open-out ventilators, metal side hinged or vertical sliding screens may be used as desired. Rolling screens up to 6'0" wide may be used where entire window is covered. On open-in ventilators, metal (removable) (fixed) outside screens may be used.)



(Note:—Where desired the window manufacturer will furnish, at reasonable added cost, removable tubular steel frame, rewirable screens (baked enameled finish) with No. 16 mesh bronze screen cloth. These screens are well constructed and furnished completely adapted to and fitting the ventilator opening.)

(Note:—All shades must be located at least 2" from the inside face of the window for hardware clearance.)



(Note:—Shade bracket clips, designed to attach by drilling and tapping two small holes at the top of each jamb section, are supplied at slight added cost. These clips are of sufficient depth to bring the shade bracket in the proper position and are slotted to accommodate any standard shade bracket. Shade clips cannot be used satisfactorily with rolling screens, but shade brackets may be attached to the under side of screen box.)

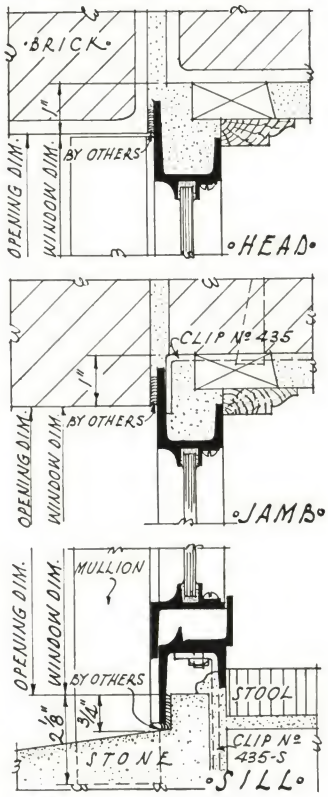
Fenestra 1932	Fenestra Projected Windows Commercial and Architectural Types	Plate No G-205

ARCHITECTURAL TYPE — SPECIFICATIONS

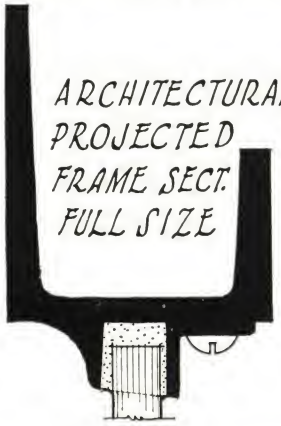
ARCHITECTURAL PROJECTED WINDOWS are similar to Commercial Projected types in general construction and operation, but differ chiefly in the following particulars:

FRAME MEMBERS are unequal leg channel sections.

Standard types vary from 3′0″ wide to 5′0″ wide including 3′6″, 4′0″, and 4′6″. Standard heights vary from 4′6″ to 9′0″ and include 5′0″, 5′6″, 6′0″, 6′6″, 7′0″, 7′6″, 8′0″, and 8′6″.



TRANSOM BARS are solid rolled steel Z bars and angles or structural angles and channels.



CAM HANDLE brackets are of malleable iron triple riveted to the ventilators.

Hardware is of the same general design as that used on Commercial Projected Windows but is standardized in bronze with oxidized finish.

GLASS is held by glazing angles.

Fenestra 1932

Fenestra Projected Windows
Installation Details

Plate Nº G-206

CONTINUOUS WINDOWS

SPECIFICATIONS

Notes are explanatory or advisory only and need not be included in the specifications.

(Note:—Intermediate structural vertical members should be provided approximately 8′ to 12′ apart.)

(Note:—Structural Steel Girts, at heads and sills of Continuous Windows, are not furnished by the window manufacturer, and should be provided for in the Structural Steel Specifications.)

(Note:—Sheet metal flashing at heads, sills, and ends of runs is not furnished by the window manufacturer, and should be provided for in the Roofing and Sheet Metal Specifications.)

GENERAL

CONTINUOUS TOP HUNG WINDOWS shall be *Fenestra* as manufactured by Detroit Steel Products Company.

(Note:—Fenestra Continuous Windows are particularly designed for use in monitor and sawtooth roof construction where the plane of the windows is on a slope. They may be used in vertical planes where necessary.)

(Note:—Standard units of Continuous Windows measure 20′ in length (dimension points equal the clear opening.) We recommend for the economical arrangement of operator arms that units vary on multiples of 4′ (8′, 12′, 16′). Smaller units may be used if necessary, in widths varying in multiples of 2′ (8′, 10′, 12′, 14′, 16′, 18′.)

MATERIAL

All sections shall be especially designed, hot rolled, solid steel bars with heavy fillets in all re-entrant angles. HEAD AND END JAMB MEMBERS shall be special angles. MUNTINS shall be special T's 1⅜″ deep.

SILLS shall be special design sections with a long downstanding leg bent at the end to make close contact with the building construction.

CONSTRUCTION

All members of the window shall be accurately fitted and rigidly riveted at the joints to form standard panel units. Panels shall be joined, end to end midway between T muntins, by splice plates bolted to head and sill members.

(Note:—Panels are joined at the time of erection.)

At the ends of all swing sections next the building construction there shall be provided stationary 1′ panels.

Between the ends of swing sections there shall be provided stationary 2′ panels.

The joint between ends of swing sections and stationary end sections (and stationary intermediate sections) shall be covered and protected by a specially formed, 14-gauge, steel channel with one leg secured to the end angle of the swing section and designed to overlap the end angle of the stationary section.

Where so indicated, provide 2′ wide storm panels secured to stationary end (and intermediate) panels by a steel plate and to the sill by sill clips. Panels shall underlap the swing window section and shall be provided at sill with a formed continuous drip board, set over the sill flashing.

ATTACHED HARDWARE

(Note:—Attach at the factory.)

All CONTINUOUS WINDOWS shall be top hung on heavy malleable iron butts, with ⅜″ brass pins, spaced 4′ apart on centers. Butts shall be rigidly riveted to the head angle and furnished with bolts for attachment to the building girts.

ERECTION

All CONTINUOUS WINDOWS shall be erected by the Fenestra Construction Company, under a separate contract.

All windows shall be erected in a thoroughly workmanlike manner ready for glazing.

PAINTING

All windows shall be given one dip-coat of red mineral paint by the manufacturer before shipment.

(Note:—The following should be provided for in the Painting Specifications:

"One additional coat of paint should be applied after erection but before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.")

(Note:—Where desired, the Fenestra Construction Company at reasonable added cost will do field painting after erection. If required, so specify here, including specification for paint and its application.)

GLASS AND GLAZING

Glass shall be ¼″ rough wire glass.

Putty shall be a high grade of steel window putty.

(Note:—Ordinary wood sash putty must not be used.)

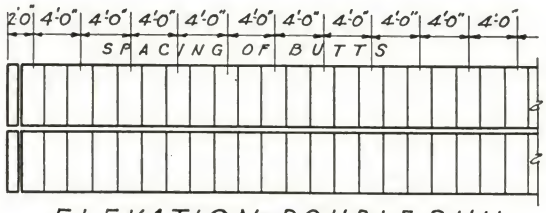
All CONTINUOUS WINDOWS shall be glazed from the outside. All glass shall be set in a heavy bed of putty and secured at muntins and end angles by angle clips secured with bolts. Face putty shall be applied at sills in a neat, clean-cut, smooth manner.

(Note:—Do not paint until putty has thoroughly hardened.)

CONTINUOUS FIXED WINDOWS

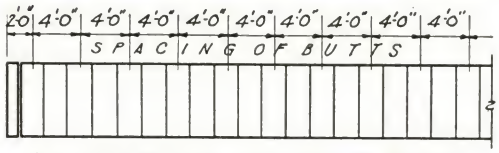
(Note:—The Specification for Continuous Fixed Windows is the same as that for Continuous Top Hung Windows except that all window units are stationary (no swing sections). Heavy steel angle clips bolted to the window head and the building girts are substituted for the butts. Steel sill clips, furnished with the window and shipped flat, are bolted to the sill of the window and bent around the steel sill girt to rigidly secure the window in position at the bottom.)

CONTINUOUS BOTTOM HUNG WINDOWS



(Note:—In general the specification for Continuous Bottom Hung Windows is the same as that for Continuous Top Hung Windows except in the following particulars:

[a] The head section is a special T.



[b] The sill section is a special angle designed to take the butts attached to a special girt.

[c] The weathering caps are attached, with the legs out, to the fixed end or intermediate panels instead of to the swing sections.

[d] The windows are glazed on the inside with face putty at both head and sill.)

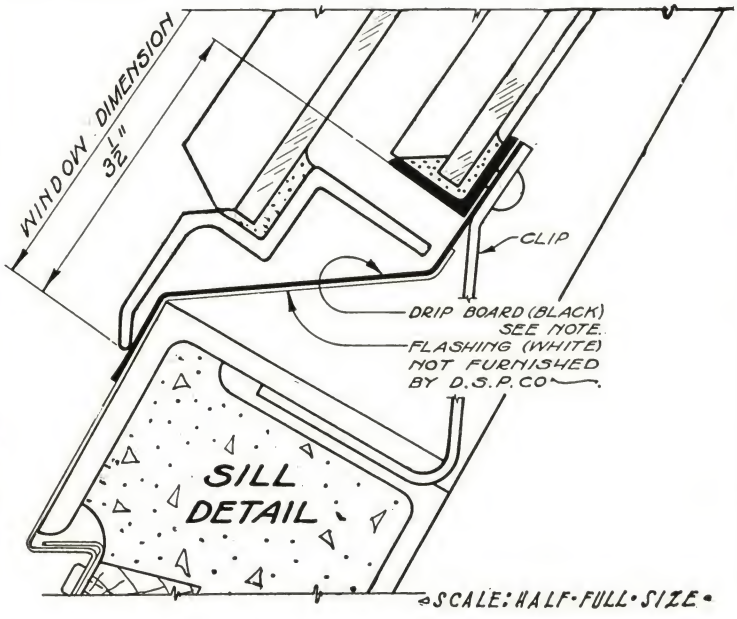
TYPICAL DETAIL AT END OF SWING RUN



TYPICAL DETAIL BETWEEN SWING RUNS

HEAD DETAIL

TYPICAL HORIZONTAL SECTION THRU STORM PANEL.

NOTE

Storm panels can be used only with top hung windows. They are recommended only for windows 30° or less off the vertical.

When panels are used in front of vertical steel members or diagonal bracing a clear distance of not under 4 in. must be used.

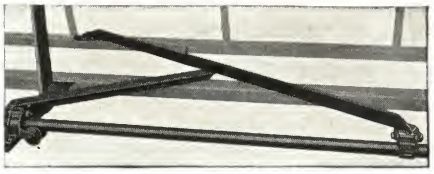
A drip board (shown in black at sill) is furnished as part of panel. This drip should not be confused with flashing at sill which is not furnished by DETROIT STEEL PRODUCTS COMPANY.

The height of glass in panel is equal to window dimension minus 4 in. The glass width is 1 ft. 11½ in.

Fenestra, August 1929	*Continuous Windows, Top Hung* *Storm and End Panels*	Plate No P-104

FENESTRA OPERATING DEVICES

SO many different conditions are encountered in designing Fenestra operators that the following descriptions and limits should be regarded as explanatory and advisory only.



Fenestra operators are not sold as separate products but only as a means of mechanically opening and closing Fenestra windows. All Fenestra operators are erected by our own erection department, the Fenestra Construction Company, which supplies the necessary support brackets for both power and transmission lines, lines the operator plumb and true and leaves it in good working order.

All operating equipment, especially electrically controlled equipment, needs occasional inspection and lubrication. Provision should be made for reaching powers or motors without undue inconvenience.

CONTINUOUS OPERATOR

Designed to operate one or several continuous windows in line (top hung or bottom hung) in either vertical or sloping planes. Unusually heavy construction and extreme care in assembly give this operator unusual strength and reliability. The power is applied through straight line motion levers. Since the leverage increases faster than the load, the operation becomes continuously easier as the windows open. This is an exclusive Fenestra principle.

Above—The Fenestra Continuous Power. Right—Continuous Lever Arm Assembly

Power is a case-hardened, machine cut, high carbon steel worm operating a special alloy, non-ferrous bronze worm gear with straight face, machine cut teeth and extra heavy hub and rim. Worm and worm shaft are turned down from a solid steel bar. Worm and gear are oil encased in an oil-tight box. Worm shaft is provided with ball thrust bearing.

Worm gear fits over a 1″ square steel shaft which drives a high carbon steel, heat-treated pinion in mesh with high carbon steel rack, carrying machine cut teeth. Worm gear and pinion are broached out to fit the shaft with the permanence and reliability of a single piece. Rack is suspended from hangers rigidly clamped to the transmission line, thus transmitting power in a horizontal direction. A steel stop clutch, rigidly attached to the worm shaft, operates to cut off the power as the window is closed.

Power transmission line is 1″ wrought iron pipe in 20′ lengths joined by solid steel plugs with a drive fit riveted in two directions. Operating arms are steel angles,

Continuous Operator on a Run of Continuous Top Hung Sash

one arm twice as long as the other. One end of the short arm is pivoted to the center of the long arm, the other end attached by a universal pivot to a housing on the operator support. One end of the long arm is attached to the window and the other end is clamped through a universal joint to the transmission line. Operating arms are spaced approximately 10′ on centers.

Power is operated: (a) By chain and chain wheel, the hub of the latter being broached to fit the flattened end of the worm shaft and secured by a set screw and cotter pin. (b) By electrical power unit operating through a sprocket and chain as in Rack and Pinion operator.

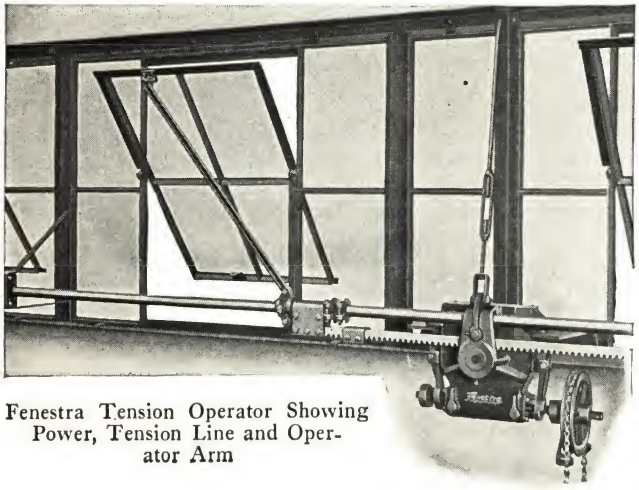
Power may be located near either end of the run, not closer than 20′ to the end. For limits of operation see a Fenestra representative, as numerous factors such as arrangement of windows, their height and the degree of opening, must be considered.

WORM AND GEAR OPERATOR

Designed for ventilators horizontally pivoted 2″ above center. May be used with top pivoted ventilators. Power consists of a machine cut, cast iron worm, equipped

Worm and gear power, power line and operating arm

with ball thrust bearings, operating a cast iron segmental worm gear assembled in a steel housing. Hub of the gear reamed to fit power transmission line and rotate it on the gear axis. Power line is of 1″ black wrought iron pipe



made continuous by steel plugs with a drive fit in two directions. Adjustable steel operating arms are rigidly clamped to the transmission line and attached to the ventilators by steel brackets.

Power is operated: (a) By a chain passing over a chain wheel which is broached to accurately fit the flattened end of the worm shaft and secured by a set screw and cotter pin. (b) By a 1″ black wrought iron pipe connected to the worm shaft and carried down vertically to a miter gear (with removable crank) encased in a gear box.

Power may be vertical or inclined, located at either end or at any intermediate point. Operator limited to 12 single 2-pane high vents in a single run and 40′ on either side of the power. Multiple runs limited to 9 single 2-pane high vents and 20′ on either side of the power. Miter gears limited to 9 single 2-pane high vents each.

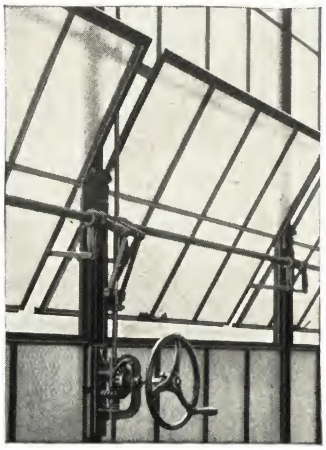
TENSION OPERATOR

Designed to operate long runs of horizontally pivoted ventilators. In general construction and design Tension operator is similar to Continuous operator. Power and transmission lines are the same, except that each power is equipped with a double stop so that all movement is

Fenestra Tension Operator Showing Power, Tension Line and Operator Arm

stopped and power cut off both when the vents are closed and when they are fully open.

Operating arms are adjustable, straight, steel channels rigidly attached to the tension line by malleable iron and steel swivel clamps. Arms attach to the vents by steel pivot hinges.

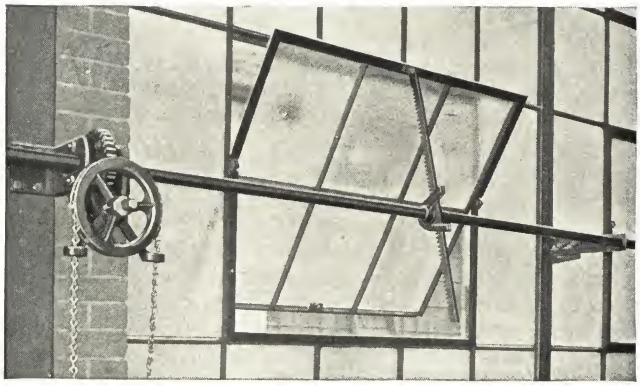


Power may be attached at either end of the run not closer to the end than 20′. Operator limited (single power) to 300′.

SCREW TYPE OPERATOR

Designed for use in high openings, such as power house bays, filled entirely with windows and structural mullions. May be used with ventilators pivoted 2″ above center or 4″ down from the top. Lies close to the windows, out of the way of cranes. May be concealed in the walls, if desired, at extra cost.

Two types of power are available: (a) Open bevel gears, manually operated by a hand wheel. Power to be assembled in an open cast iron case. (b) Electrical power with gears assembled and oil encased in a dust-proof gear box. Power to be connected either directly through a universal joint or by sprocket and chain drive.



Either power operates a ¾″ vertical, threaded steel shaft upward or downward. To this shaft are connected heavy, cast iron cross heads, which operate cast iron rocker arms, which in turn are connected to the transmission line. Transmission line is 1″ wrought iron pipe with drive fitted steel plugs and rotates to operate pivoted lever arms (two to each vent), which connect with the ventilator jamb bars. Power may be located at either end of the run or at any intermediate point. Operator limited (single power) to 20 2-pane high vents pivoted 4″ from top or 50 2-pane high vents pivoted 2″ above center. One row of fixed lights at the sill of the window usually is required to permit clearance of power.

Screw Type Operator

RACK AND PINION OPERATOR

Designed for ventilators pivoted 4″ from the top or with vents pivoted 2″ above center. Three types of power are available: (a) Light power: 32 to 1 reduction. Cut steel worm equipped with ball thrust bearings, operating a cast iron worm gear assembled in a steel housing. (b) Heavy power: 45 to 1 reduction. Machine cut steel worm equipped with ball thrust

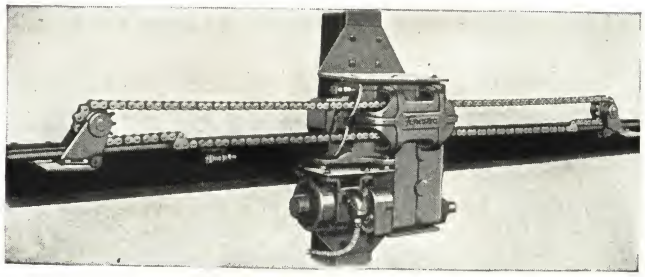
Rack and Pinion Operation of Pivoted Ventilators

bearings operating a semi-steel worm gear assembled and oil encased in a dust-proof gear box. (c) Electrical power: 71 to 1 reduction. Machine cut steel worm equipped with ball thrust bearings operating a semi-steel worm gear assembled and oil encased in a dust-proof gear box.

Power line is 1″ wrought iron pipe to which pinions are rigidly attached. Operating arms are straight steel

racks attached to vents and clamped in mesh with the pinions.

Light and heavy powers may be operated (a) by chain and chain wheel or (b) by crank and miter gear (similar to worm and gear operators). Electrical power is operated by a cast iron sprocket wheel keyed to the worm shaft and motor driven through a chain drive. The electrical equipment is mounted directly beneath and joined to the power gear case forming one complete power unit.



Power may be either vertical or inclined, located at either end of the run or at any intermediate point. Light and heavy operators in single runs limited to 80′ and 12 horizontally pivoted vents on either side or 40′ and 6 top pivoted vents on either side. Double runs limited to half that of single runs. Electrical powers in single runs limited to 300′ for horizontally pivoted vents or 150′ for top pivoted vents. In double runs, electrical powers are limited to 150′ for horizontally pivoted vents and 75′ for top pivoted vents.

SUPER-POWER OPERATOR

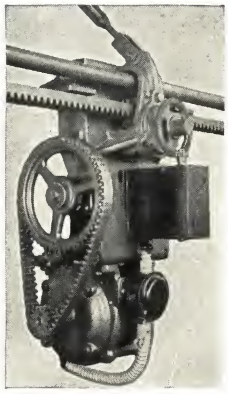
For exceptionally large industrial buildings where unusual operating service is desired on long runs of continuous top hung windows, we are prepared to supply the Fenestra super-power which, in connection with continuous operator transmission line and lever arms, will handle conveniently top hung continuous windows in runs up to 600′.

The utmost care has been used both in workmanship and materials to produce a device that combines smooth, even, efficient action with superlative strength and durability.

The power consists of a heavy, double, spur gear reduction of especially heat-treated alloy steel and a case-hardened steel worm engaging a heavy, special alloy,

The Fenestra Super-power

non-ferrous bronze worm gear. Shafts for all spur gears are of heat-treated alloy steel with generously proportioned bearings. The worm shaft has, in addition, combination radial and thrust bearings of ball bearing type. The entire mechanism is enclosed in an accurately machined oil-tight case.



The power is usually located in the center of the run, operating a transmission line on either side through a heavy, continuous, roller type, chain drive. The motor is direct connected to the power by means of spur gears.

Conditions demanding the use of this super equipment are unusual. We strongly recommend consultation with Fenestra engineers who will be glad to make suggestions without obligation.

ELECTRICAL EQUIPMENT

The following specifications cover the electrical equipment for Fenestra operating devices:

All mechanical operators, electrically controlled, shall be provided by the operator manufacturer, with complete electrical equipment, as hereinafter specified. The operator manufacturer shall provide complete wiring diagrams.

Continuous Power Electrically Controlled

Motors shall be of type best adapted to the power equipment, of high torque and ample horsepower.

(Note:—Motors operating on 220-volt or 440-volt, 60-cycle, 3-phase, alternating current are recommended. Direct current motors are not carried in stock, but if alternating current is not available a special motor for 230-volt, direct current, can be supplied.)

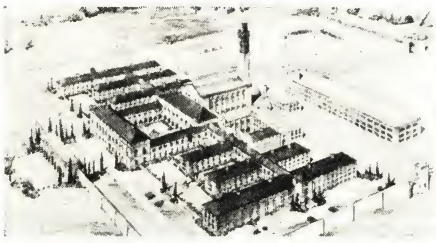
(Note:—Specify current furnished.)

Motors shall be connected to power by means of sprockets and chains, or direct connected through universal joints as best adapted to power requirements. Standard magnetic reversing switches shall be enclosed in steel boxes and so designed that the movement of the ventilator, either in opening or closing, may be stopped or started at any point by manipulation of push buttons.

Limit switches shall be positive in action and rigidly attached to the power to form an integral part of the power unit. All limit switches shall be enclosed, yet accessible for adjustment so as to positively limit the motion of the ventilator in either direction.

Push button stations "open," "close" and "stop" shall be of rugged construction to withstand hard usage. Buttons shall be recessed in cover so that they cannot be accidentally operated.

(Note:—The following provisions should be made in the Electrical Specifications:



The electrical contractor shall install magnetic reversing switches and push button stations and shall furnish and install safety type line switches. He shall also furnish all conduit, fittings and wire and do all wiring in accordance with the wiring diagram between the electrical equipment furnished by the window operator manufacturer and that furnished by himself.

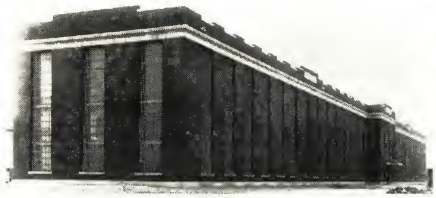
All materials and workmanship shall meet the requirements of the National Electric Code and all Local and State Inspection Bureaus.

Conduit shall be galvanized or black enameled. Wire shall be rubber covered N. E. C. Exposed conduit shall be run in a systematic, sightly manner, parallel with structural features of the building and rigidly and neatly secured. Where walls are plastered, conduit shall be concealed.

The electrical contractor shall carry fire, workmen's compensation, and public liability insurance. He shall guarantee his work for a period of one year after completion. Defect in the work and material furnished by him, developing during the above named period, shall be promptly and satisfactorily made good at his expense.)

FENESTRA DETENTION WINDOWS

Federal Penitentiary,
Lewisburg, Pa.



Boys' Vocational School,
Lansing, Mich.

Detroit House of Correction,
Detroit, Mich.

Michigan State Hospital,
Traverse City, Mich.

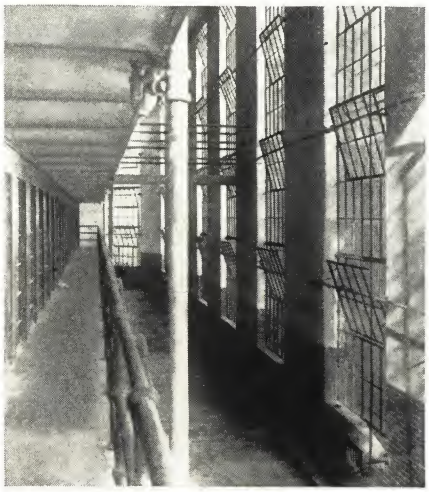
Erie County Penitentiary,
Wende, N. Y.

Michigan State Prison,
Jackson, Mich.

The term "Detention Windows" is used to designate collectively, what is really an extremely varied assortment of windows, all designed to function as windows should, and, at the same time provide a certain amount of restriction.

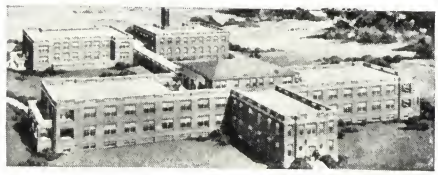
How much restriction is desired? That is the fundamental question to be carefully analyzed before any window suggestions can be offered, and the answer depends to a large extent on the character of the institution. Consider, for example, the following: (1) Homes for eccentric old people. (2) Reform schools for minors. (3) Hospitals for the mildly deranged. (4) Asylums for the violently insane. (5) Prisons for city, county, state and Federal criminals.

As the degree of detention varies, so also does the design and construction of the windows to be recommended.

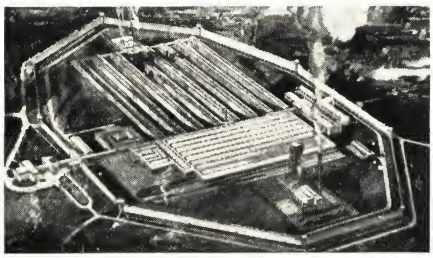


Fenestra Detention types cover the entire range from casement and projected designs, with large ventilators slightly restricted as to opening up to heavy 1¾" sections, 6"x9" glass lights, one-light high ventilators and the strength and rigidity of prison bars.

Combinations may include open-in and open-out ventilators; screened or unscreened; with or without grilles; fixed units in connection with movable wood sash; ventilators with limiting stops; ventilators with special keyed locks; ventilators with fixed units, or with prison bars outside.



Fenestra Engineers will be glad to co-operate in designing the type of window suitable for any institution and any purpose.



State Hospital, Crownsville, Md.

Wisconsin State Prison,
Waupun, Wis.

Berks County Sanitarium, Berks Co., Pa.

Eastern State Penitentiary,
Graterford, Pa.

Oregon State Asylum,
Pendleton, Ore.

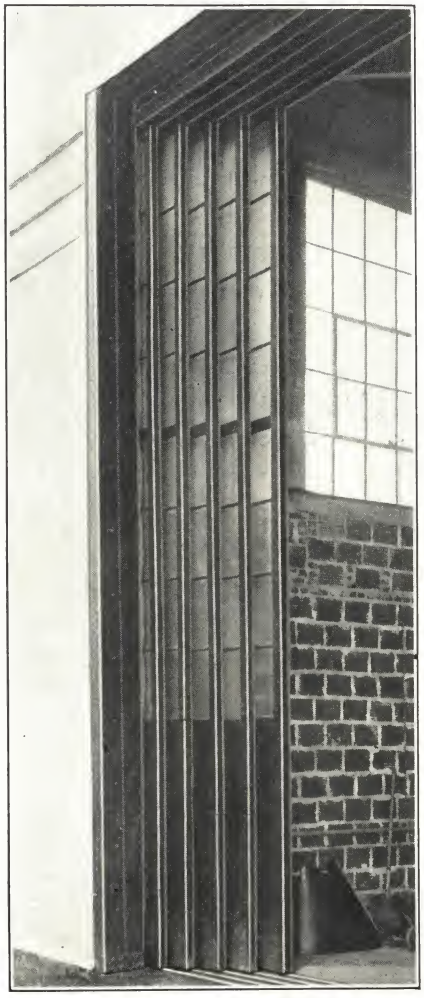
AIRPLANE HANGAR DOORS

SPECIFICATIONS

(Note:—Practical limits are determined largely by shipping facilities, height of tunnels, width of bridges, etc.)

GENERAL

All doors shall be Fenestra Airplane Hangar Doors as manufactured by the Detroit Steel Products Company.



MATERIAL

(Note:—All framing to be included with the Miscellaneous Structural Steel or Ornamental Iron or under other specification divisions.)

Upper part of doors shall be provided with glass panels constructed of solid rolled steel frame sections and muntin bars of 1⅜" depth. Lower panels shall consist of solid 13-gauge steel plates.

(Note:—Doors of the same general design as those shown above can be furnished with structural rails and stiles.)

All door stiles and rails shall be made of (2½"x2½") (3"x3½") (4"x 2½") steel tubing. Rails shall be solidly welded to stiles at all junctions. Weathering between doors on adjacent tracks shall consist of rubber strips, secured by continuous metal retainers to the stile of one door, making contact weathering against the stile of adjacent door. Weathering between doors on the same track shall be of steel.

Fenestra "Straight Slide" Hangar Doors

Fenestra "Round the Corner" Hangar Doors

CONSTRUCTION

Frames of glass panels shall be mortise and tenon, air hammer riveted, and welded at all corners. Muntins shall be continuous from bottom to top and from side to side, so interlocked at intersections as to increase the rigidity and strength—joints at frames shall be mortise and tenon, air hammer riveted. Solid panels shall be secured to tube frame.

(Note:—Where glazing angles are specified all glass shall be secured with glazing angles mitered at corners. Angles shall be secured with machine screws tapped to frame, and with machine screws and nuts to muntins.)

All doors shall rest on double flanged, malleable iron wheels so designed as to roll on steel tracks carrying the entire weight of the doors. Each wheel shall be mounted by housings and plates, and equipped with roller or swivel ball bearings and Alemite lubricated.

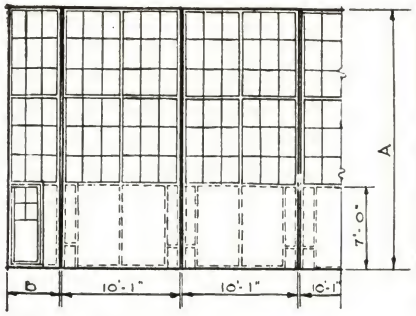
Bronze bushed malleable iron rollers shall be attached to the head rail of each door, to serve as guides and reduce friction, and minimize the transverse load on structural steel members.

(Note:—Hinged pilot doors supplied as specified.)

Unless otherwise specified a swing door, to fold back against the wall, will be furnished at each end of the door opening, to provide track clearance for curved track type doors.

ATTACHED HARDWARE

Suitable locking hardware, such as friction bolts, cremone bolts, etc., shall be supplied for each door.



ERECTION

All doors shall be erected by the Fenestra Construction Company under a separate contract.

Airplane Hangar Doors
Types and Sizes

Plate No *Y-122*

FENESTRA BYRNE DOORS

Fenestra Byrne Door in the Hangar of the Continental Airways, Inc., Chicago, Ill.

The Fenestra Byrne Door has the following advantages which will appeal at once to any one with a practical knowledge of hangar door construction or operation:

(1) It is built entirely in one piece which eliminates the time and effort needed to move sectional doors of either sliding or lifting types.

(2) It opens or closes, silently, in the shortest possible time and with minimum effort. Hand operation, 50 to 90 seconds; Electric, 18 to 30 seconds; Pull, about 15 pounds.

(3) It can be operated from one position which is accessible either from within or without and protected in case of fire.

(4) It does not occupy valuable ground space at the sides of the hangar.

(5) It does not occupy floor space nor does it blind or restrict windows in the sidewall, when open.

(6) It requires no floor tracks which fill up with dirt or snow.

(7) It operates in the severest winter weather; guides cannot clog or freeze.

(8) When open, it forms a canopy across the entire door opening, adding 6′ to 10′ to the roofed area and protected floor space.

(9) Its first movement in opening is a vertical lift of 8″ which clears any ordinary snow or ice outside.

(10) When closed, it weathers with a flat contact at head, jambs and sill; unsurpassed as a storm protector and fuel saver.

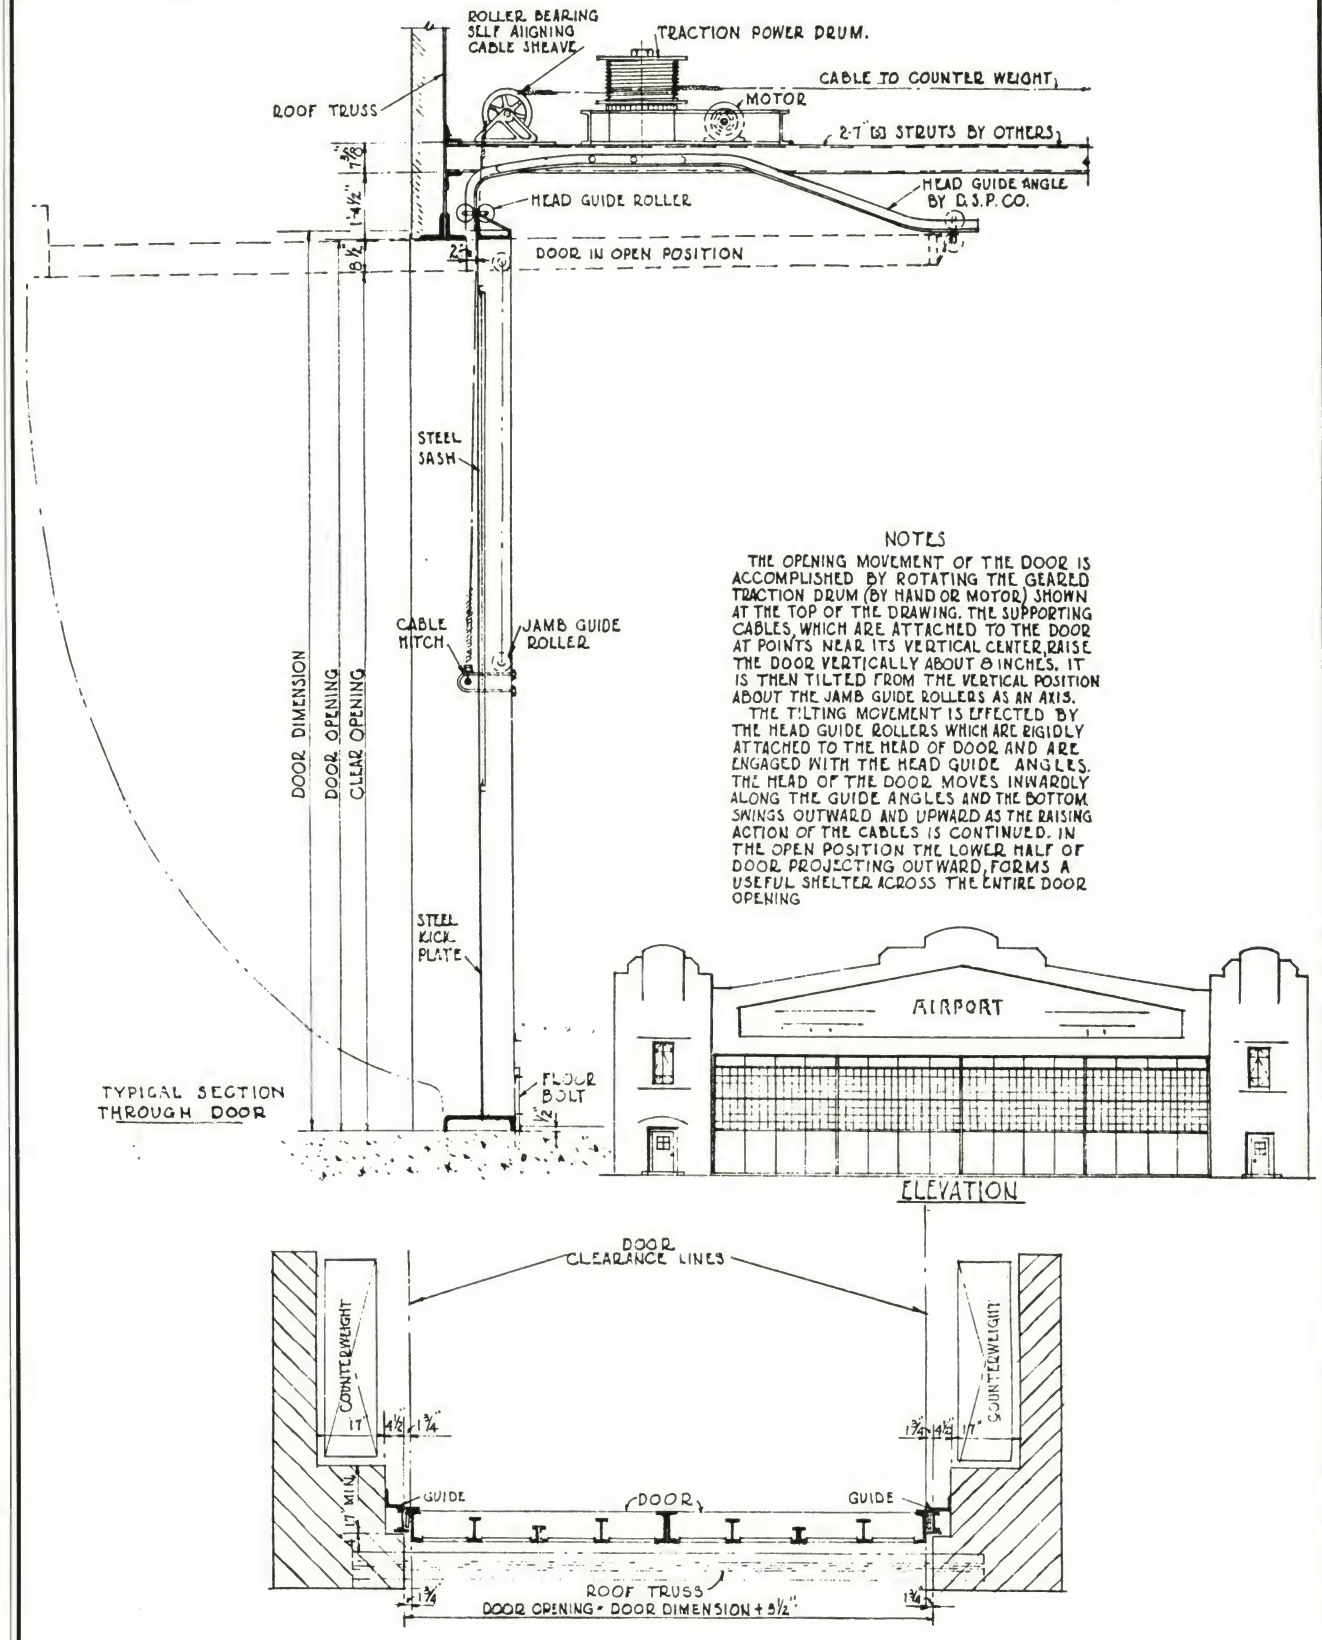
(11) It requires only 8½″ clearance above the top of the door opening.

(12) It can be installed in most hangars without changing the design in any way, and with practically no additional structural steel.

(13) The Fenestra Byrne principle has had over four years of development and satisfactory use.

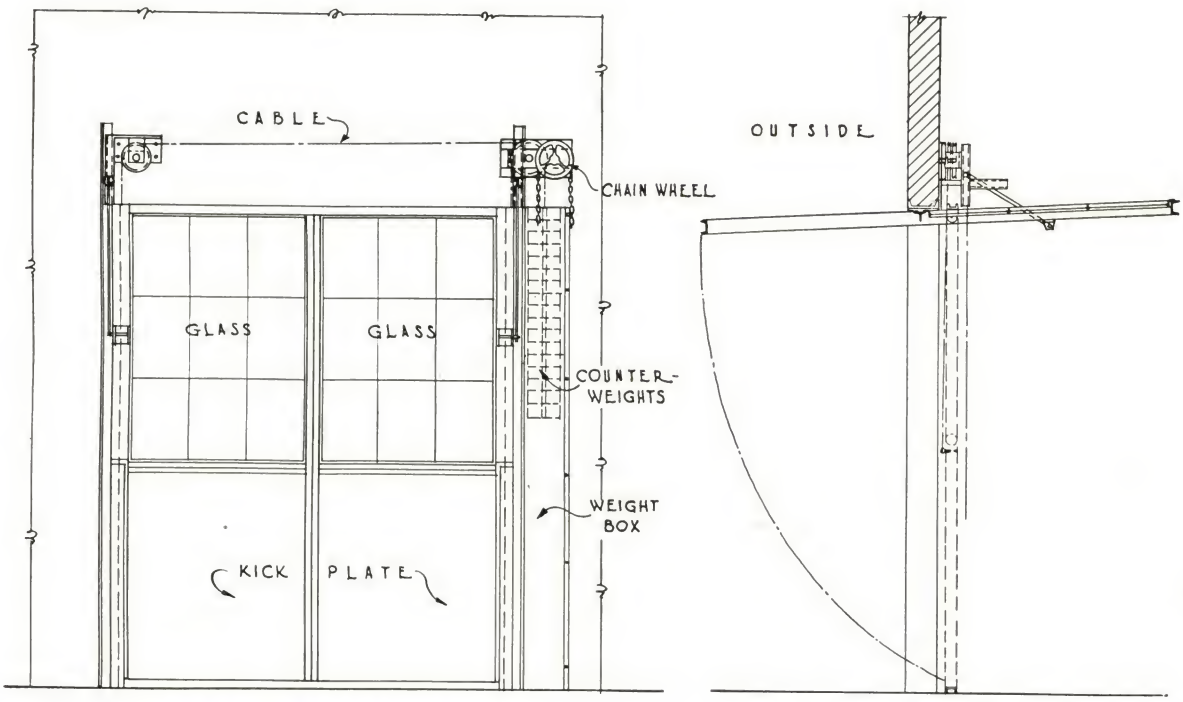
Fenestra Byrne Doors are constructed from structural shapes, neatly fitted and solidly welded and can be designed up to 28′ high and 150′ wide. The upper 1′ and lower 7′ of the door are covered by 13-gauge kick plates, the intermediate section being filled with Fenestra fixed windows.

In opening, the door lifts vertically 8″, then tilts as it rises until, when fully open, it is practically horizontal, half inside and half outside of the door opening.



Operation is by means of heavy, high tensile alloy steel cables, spaced about 20′ on centers. These cables, attached near the center of gravity, extend up the outside of the door and are carried over roller bearing sheaves around a central power drum with traction grooves and thence to conveniently located counterweights. Each cable has a liberal safety factor so that even if one or more cables were broken, those remaining would be ample for support.

The central power drum is rotated on a vertical axis by a worm and worm-gear power unit, either electrically or manually operated. Hand operation is by means of a heavy wheel and endless manila rope. Power operators are equipped with auxiliary hand operators and the change from power to hand operation or vice versa is instantaneous.



Solenoid or mechanical brakes and limit switches are provided to insure absolute safety and positive control.

When closed, the door weathers at the head with a combined sliding and pressure contact, flat, definite and positive against a flexible base attached to the building construction. At the jambs, a similar contact is made with solid steel weathering bars. At the sill, the door fits tight against the rabbeted concrete floor.

Floor bolts and positive anchors at the head are provided to lock the door against any wind pressure.

COMMERCIAL STEEL DOORS

SPECIFICATIONS

GENERAL

All doors shall be Fenestra Commercial Steel Doors, swinging or sliding as indicated, manufactured by the Detroit Steel Products Company. All swing doors shall be provided with pressed steel door frames.

MATERIAL

Stiles and rails shall be 14-gauge sheet steel, the meeting rail to be a special shaped section and all others to be formed and welded into 1⅝″ x 4″ tubes.

Muntins and astragals shall be solid rolled steel sections.

Lower panels to be 18-gauge sheet steel.

Commercial Swing Door

Commercial Double Sliding Doors

CONSTRUCTION

Door corners shall be mitered and assembled over heavy reinforcement which shall extend at least 8½″ in two directions from the corner and provide a base for attachment of hinges or clevises. Mitered joints shall be face welded around the entire miter and ground smooth.

Steel panels shall be spot welded to stiles and rails.

Muntins shall be interlocked at points of intersection and pivot ended and welded into the stiles or rails.

All double doors shall have astragals rigidly attached to the left-hand leaf.

DETACHED HARDWARE—SWING DOORS

Supply Half Surface, Loose Pin, Sherardized, Steel Hinges.

(Note:—Two hinges for each leaf are supplied for all doors up to 8′ 0″ high. For doors higher than 8′ 0″, three hinges are supplied.)

Japanned Steel Tee Latch and Keeper and Japanned Steel Cabin Hook shall be supplied as standard on all single and double swing doors.

Note:—Bronze mortise cylinder locks, master-keyed if desired, may be had at extra cost.)

Japanned Wrought Steel Chain Bolt and Foot Bolt shall be supplied, one each on the inactive leaf of each double swing door.

DETACHED HARDWARE—SLIDING DOORS

Pressed steel clevises shall be supplied for attachment at upper reinforced corners to accommodate trolley hangers.

Supply one Japanned Steel Safety Hasp for attachment to each active leaf with staple for inactive leaf or door frame.

(Note:—We do not supply padlocks.)

Supply two Japanned Steel Flush Pulls for attachment one on each side of each sliding door leaf.

Supply standard, deep channel tracks, supported on 2′ centers by U-shaped track brackets of heavy gauge steel. Supply heavy duty, four wheel, roller bearing trolleys with adjustable trolley hangers for attachment to clevises.

Guides shall be solid rolled steel angles with flaring edges. Binders shall be formed bar steel. Center stops on double sliding doors shall be malleable iron castings.

DOOR FRAMES

(Note:—Frames for sliding doors are not furnished by D. S. P. Co.)

Door frames shall be 13-gauge sheet metal formed into specially designed 1½″ x 4″ channels with self-contained rebate.

All door frames shall extend 1″ below the finished floor line for anchorage.

All door frames shall anchor to structural steel or shall be equipped with bar steel anchors, to extend into the masonry, approximately 18″ apart.

ERECTION

(Note:—At reasonable cost, Fenestra Construction Company will erect doors and frames. If desired, so specify.)

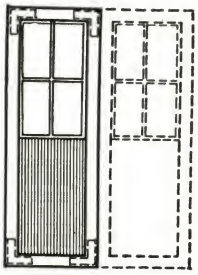
PAINTING

All doors and frames shall be given one brush coat of red oxide paint at the factory.

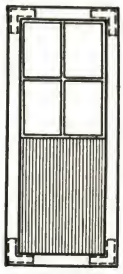
(Note:—Include in the Painting Specifications that all doors and frames should be given at least one additional coat of paint after erection.)

(Note:—Where desired, Fenestra Construction Company will do field painting after erection, at slightly added cost. If desired, so specify including specifications for paint and its application.)

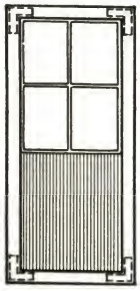
GLASS AND GLAZING



Glass shall be ¼″ rough wire, ¼″ factory ribbed, or ⅛″ factory ribbed.

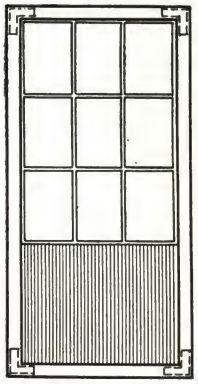


(Note:—¼″ glass is recommended. Single or double strength glass should not be used. Glass is not furnished by D. S. P. Co.)



Putty shall be high grade steel window putty.

(Note:—Ordinary wood sash putty must not be used.)



All doors shall have glass set in a bed of putty and held in place by steel glazing angles mitered at the corners.

Commercial Steel Doors
Swinging and Sliding Types and Details

Plate No Y-505

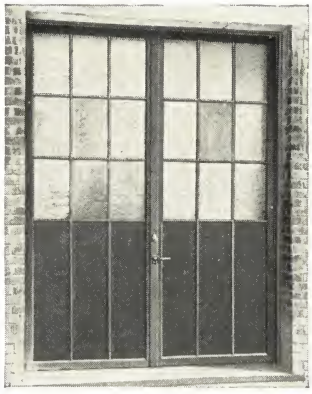
FENESTRA INDUSTRIAL DOORS

Fenestra Industrial Doors are designed in types which swing, slide, fold, roll, lift or pivot. They may be operated either manually or electrically.

Doors designed especially for airplane hangars are shown on preceding pages. Industrial and commercial doors shown here are intended for use in warehouses, mills, garages, roundhouses, car shops, powerhouses, piers, freight depots, fire stations, factories, grain elevators, police stations and the utility departments of apartments and office buildings.

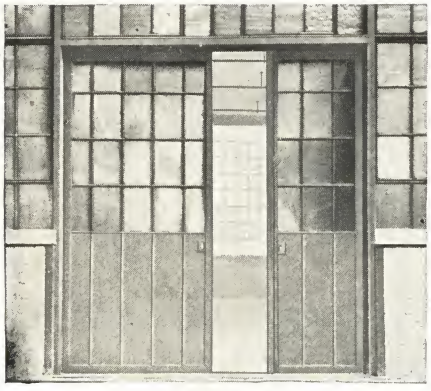
Fenestra Engineers are equipped to solve unusual door problems. Where openings of unusual size are encountered or peculiar methods of operation are necessary, Fenestra Engineers will be glad to make suggestions and layouts without cost or obligation.

Since door frames, in all cases, should be installed when the building is erected to insure proper anchorage, while the doors themselves should be installed after the building is completed, we strongly recommend that door frames be included in the Structural Steel or Ornamental Iron Specifications, including slotted sliding door thresholds and track supports where required. Frames should be made to the exact dimensions given by the door manufacturer and erected plumb and true.



Where particularly desired, 4″ channel frames for swing doors only, will be furnished with the doors at added cost.

SWINGING AND SLIDING DOORS



Fenestra Swing and Slide Doors are manufactured of pressed tube or tubular steel in single and double units.

Single Swing Door

Double Swing Doors

Double Sliding Doors

Closures, guides and meeting rail astragals are heavy steel plates. Tubular stiles and rails are mitered and welded at corners. Stiles are reinforced at the butts by heavy steel plates.

Panel frames are assembled in a manner similar to fixed industrial windows.

Glass is set in putty and secured by angle clips attached to the frames by machine screws. Where necessary, stiles are tapped to receive hardware which is applied at time of erection.

Swinging tubular doors are equipped with 6″ x 4½″ butts; channel trim doors with 4½″ x 4½″ butts. Both types have non-rising, loose butt pins.

All swinging single doors are equipped with standard, bronze faced, mortise cylinder locks, or japanned iron tee latches and strikes. Both single and double swinging doors are equipped with malleable iron or bronze handles and bronze faced cylinders and escutcheons. Inactive leaves of double swinging doors have standard top and bottom steel shot bolts, top bolt chain operated.

Sliding doors are equipped with combination flush and projecting iron handles, one on each door, solidly riveted to the panels; also hinged hasps and staples. They hang from standard steel tracks on adjustable roller bearing trucks and track brackets.

Special hardware, such as master keyed locks, standard fire exit panic bolts, door checks, etc., may be had at extra cost, if specified in advance.

FENESTRA BI-FOLD DOORS

Furnished in pressed tube, structural steel or tubular steel construction. Upper leaf fitted with steel windows or solid steel plates. Lower leaf, steel plate only. Furnished with hand chain operators or doors smaller than 12′ x 10′ may be operated by direct hand lift.

Bi-fold Door

Vertical Lift Door

FENESTRA VERTICAL LIFT DOORS

Furnished in pressed tube, structural steel or tubular steel. Conserve floor area or platform space. Counterbalanced — easily operated. Double leaf door requires headroom equal to half door height plus 1′ 8″. Furnished with hand chain or electric operator, or smaller sizes may be operated by direct hand lift. May be installed in any building where headroom permits.

FENESTRA PIER DOORS

Designed for heavy duty in piers and railroad terminals. Divided horizontally into three sections, the top two hinged together and to the top of the door opening. The bottom section (about half the door height) slides vertically in guides until its lower part engages the middle section. The nested sections then swing inward and upward to full door opening. When open, door is entirely within the building. Supplied in structural channel stiles and rails or tubular steel rails. Hand or power operation. Upper sections may be fitted with windows.

Pier Door

FENESTRA ACCORDION DOORS

Roundhouse Doors

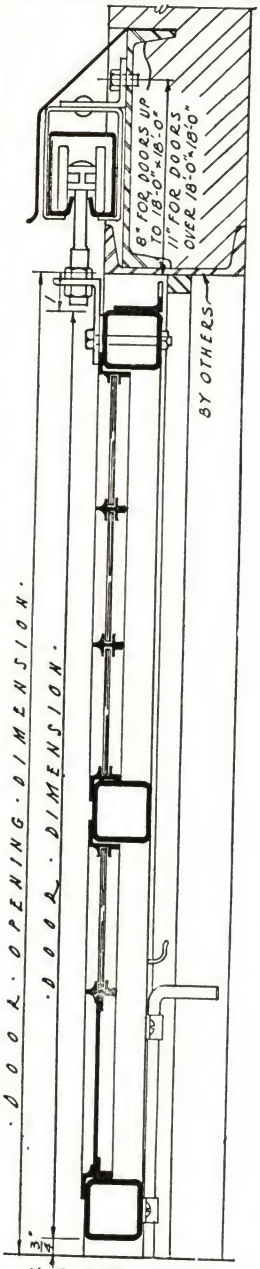
Accordion Doors

Fenestra Accordion Doors are suitable for roundhouses and buildings that require extra large door openings. Hinges are heavy steel forgings accurately machined and fitted with large steel pins. Pilot doors can be installed where desired, equipped with cylinder locks. Main doors are fitted only with hasp and staple.

FIRE STATION AND GARAGE DOORS

For fire stations, public garages, bus terminals and motor repair shops, Fenestra Doors, either double swinging or accordion type, supply a wide, high opening with ample clearance for cars or trucks. Either type may be arranged to open in or out, manually operated or electrically connected to a remote control station. Of tubular construction and heavily reinforced, these doors are built for heavy and constant usage. When equipped with especially designed, quick-acting operator mechanism, they are peculiarly adapted to fire stations and police stations. Doors of similar design are recommended for electric railway car barns.

Garage Doors



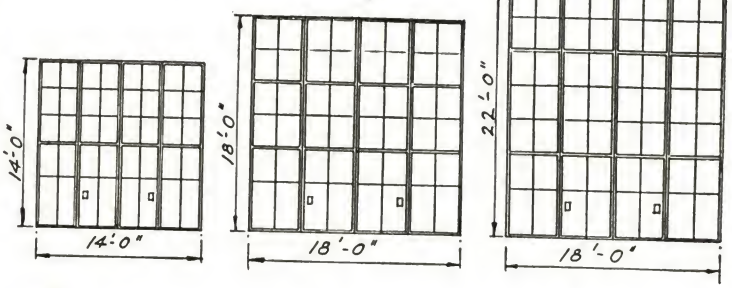
In a Car Barn

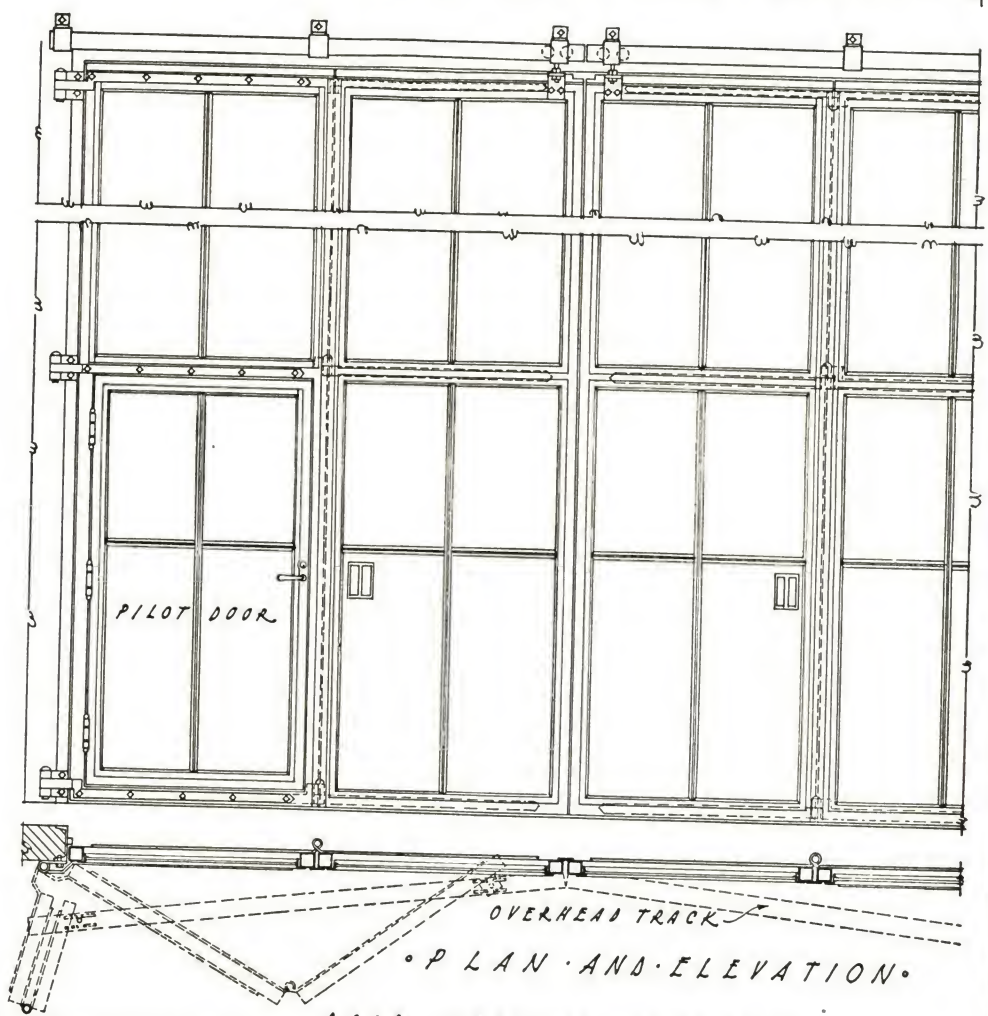
FENESTRA DOOR HARDWARE

Two standard types of hardware are regularly furnished with Fenestra Industrial Doors.

Our Series 100 Hardware with steel shroud plates and cast sheaves, fitted throughout with roller and ball bearings has been especially developed for high speed operation. Our Series 500 Heavy Duty Hardware is furnished with larger sizes of Fenestra Doors. Hand chain operator consists of chain pocket wheels and heavy duty spur gear drive mounted on anti-friction bearings and enclosed in an oil-tight case. Hand chain, chain wheel and guard are included.

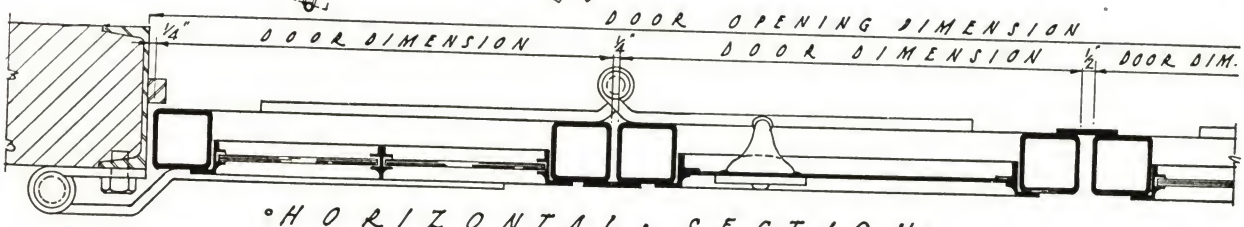
FLASHING BY OTHERS





VERTICAL SECTION

•NOTE• THESE DOORS ARE LIMITED TO 18'-0" IN WIDTH AND 22'-0" IN HEIGHT. GLAZING ANGLES ARE SUPPLIED BUT DOORS ARE FURNISHED UNGLAZED. THEY ARE EQUIPPED WITH NECESSARY HARDWARE INCLUDING TRACK WITH HANGERS AND TROLLEY, DOOR PULLS, CANE BOLTS AND HINGES



PILOT DOORS MAY BE INSERTED IN ANY UNIT IF DESIRED.

ARCHITECTURAL BRONZE
NICKEL SILVER
ALUMINUM

GENERAL·BRONZE·CORPORATION

DISTINCTIVE PRODUCTIONS IN·ALL·METALS
LONG ISLAND CITY, N.Y.

Copyright, 1931, General Bronze Corporation

BRONZE ENDURES FOR ALL TIME. It is foremost among the group of non-ferrous (non-rusting) alloys, whose base is copper, employed for architectural and building purposes. It has perpetually recorded and preserved civilization's progress and man's art expressions from time immemorial.

Buildings equipped with Bronze work possess certain recognized qualities of dignity, refinement and permanence which tenants quickly detect and which emphasize the owner's pride of possession.

The Bronze Industry has been revolutionized during the last quarter of a century. New alloys, new processes and new construction have been so developed that Bronze Work, heretofore deemed economically impossible for any but costly monumental structures, is now available for the better grade buildings of every class; as is evidenced by a constantly increasing demand and use.

The extruded process has developed a group of standardized metals known as extruded bronze, extruded nickel, and extruded aluminum. This process consists of forcing semi-molten billets through steel dies, forming profiled sections of such uniformity and precision that even fine watch mechanisms can be made from extruded sections. These physical, structural and accuracy values are ideally adapted to architectural work.

GENERAL BRONZE CORPORATION, by extensive engineering study, research and development, has standardized a series of Metal Building Specialties in non-ferrous metals, at the same time preserving those traditional construction methods accepted as worthy of the time-honored qualities of this so-called semi-precious metal.

In the following pages we have endeavored to show the excellent qualities of "Polachek" Patented Double Hung and Casement Windows which are fabricated in this construction and by these methods. The advantages gained in mechanical precision, through the use of Extruded Sections, are augmented by the painstaking care of skilled bronze artisans and mechanics in machining, fitting and assembling. They meet every requirement of efficient service, preserve the exacting standards of fine Bronze work and will endure as long as the structures of brick and stone in which they are set.

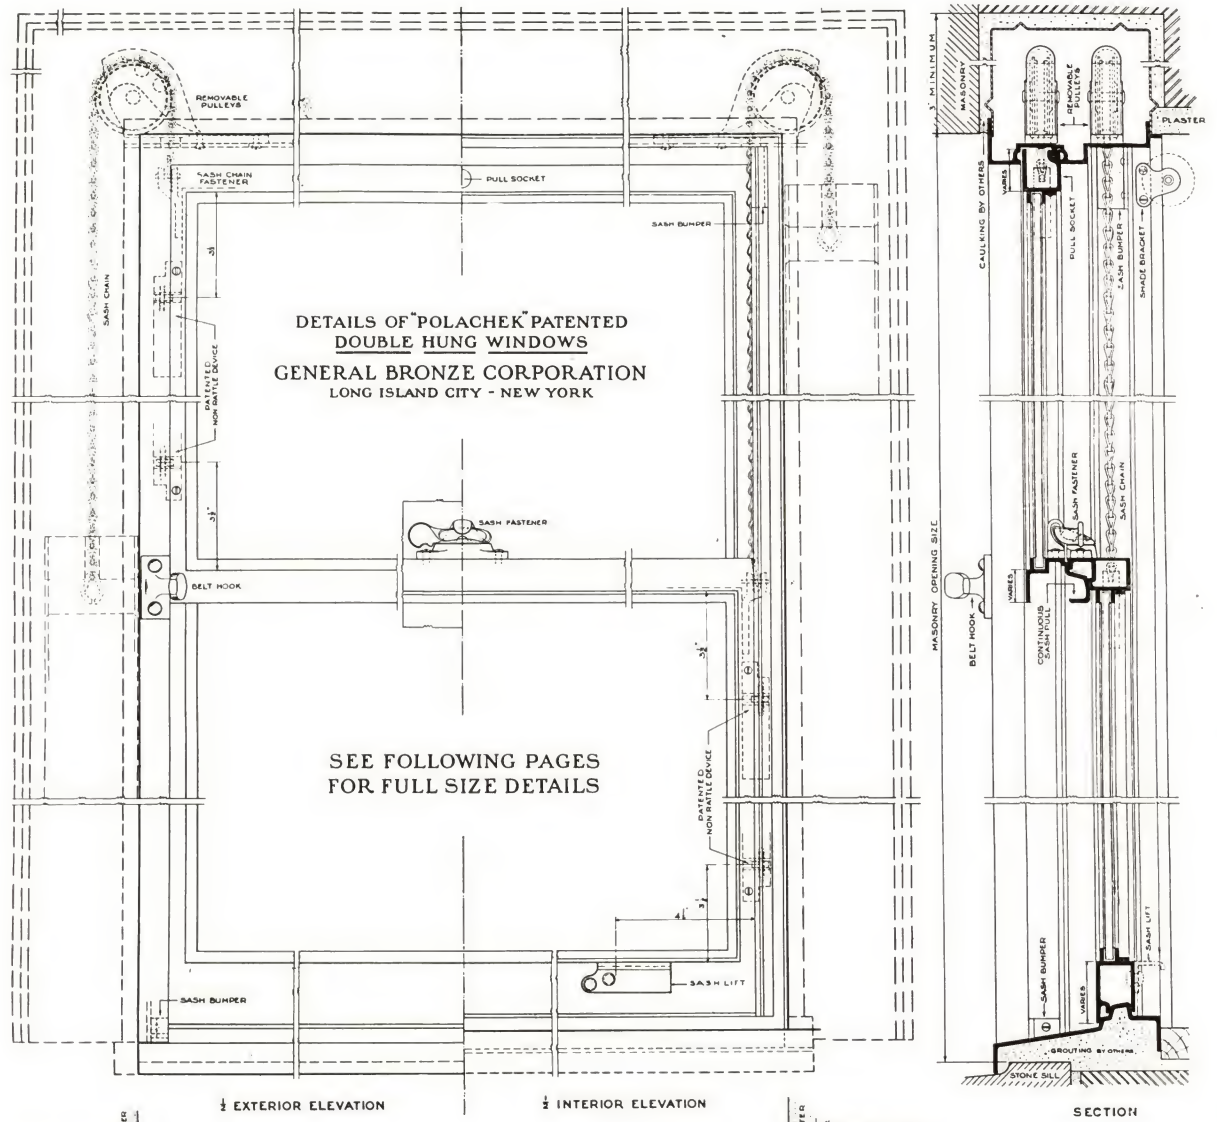
	D. H. Metal Window Weatherstripped	0.5	1.0	1.3
	Wood Window Weatherstripped	0.5	0.9	1.2
From tests by University of Wisconsin, 1931, of "Polachek" Patented Double-Hung Windows		0.2	0.4	0.5

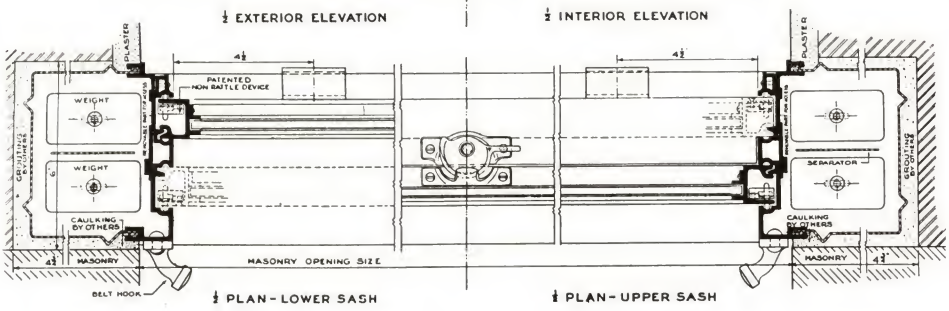
These Curves Show Average Air Infiltration Through the Several Windows Listed Under Varying Wind Velocity Conditions

A—"Polachek" patented double-hung bronze window tests made by University of Wisconsin, March, 1931, under the most severe conditions, such as leaving the sash unlocked, etc.

B—Typical wood window—metal weather strips—from data in "The American Society of Heating and Ventilating Engineers Guide," 1931.

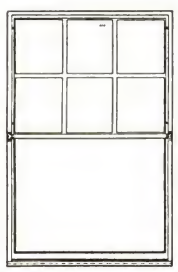


C—Typical double-hung metal window weatherstripped, from data in "The American Society of Heating and Ventilating Engineers Guide," 1931.

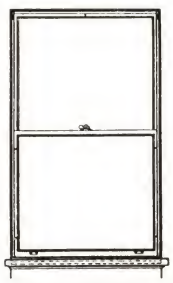


D—Typical double-hung metal window without weatherstripping, from data in "The American Society of Heating and Ventilating Engineers Guide," 1931.

Careful Design and Construction Throughout Have Made the "Polachek" Window, Produced in either Bronze or Aluminum, Stand Out as Finest.



Salient Features of "Polachek" Double-Hung Windows Are Permanent Features



What They Are—	Why They Are—
(1) Easy operation.	(1) Rigid construction and exact alignment which prevent binding on the vertical movement, and lever type lifts to break contact at the sill.
(2) Rattleproof.	(2) A concealed device, built into the side stiles and instantly adjustable, prevents all lateral movement of sash when in any position.
(3) Weatherproof.	(3) Weatherstripping is formed through steel dies as an integral part of main sash and frame members and to the same thickness. The University of Wisconsin tests prove the effectiveness of this sealing. Immovable from its initial position, too heavy to bend, too thick to wear out, this weatherstripping can never lose its effectiveness.
(4) Maximum daylight opening.	(4) Careful designing of self-reinforced members has reduced face widths to the minimum compatible with rigid construction requirements.
(5) Minimum maintenance cost.	(5) Pulleys and chain are readily replaceable. Sash and frame, being of extra heavy non-ferrous metal, and so fitted and assembled that no joint can ever open or leak, will outlast the useful life of the building without repairs, replacements or painting.

FOR CASEMENT WINDOWS AND TRANSOM SASH

DESCRIPTION OF THE "POLACHEK" PATENTED DOUBLE HUNG AND CASEMENT WINDOWS

THE "POLACHEK" PATENTED DOUBLE HUNG WINDOW, owned and manufactured exclusively by General Bronze Corporation, is air-tight and weatherproof without binding or rattling in any position; non-rusting, permanent and quiet in operation. Salient patented features are a series of accurately-matched integral wedge-shaped tongues and grooves, effecting positive multiple contacts throughout the perimeter of both sashes when closed, and concealed devices within the sash construction which effectively prevent sash rattling while in any position. Patented in the U.S. on Dec. 1, 1924; and improved on July 7, 1925; July 19, 1927, and Nov. 29, 1927.

All parts of the window are made by special dies of Extruded Metal—a trade name applied to well-known, standardized alloys in Bronze, Aluminum, Benedict Nickel Metals. Metal formed by the extrusion process contributes qualities of particular advantage to window construction —uniformity in profile, strength, rigidity and surface texture. These, combined with intelligent design, precise machining and careful assembling of the members, insure a permanently satisfactory and distinctive installation.

The design of the window is simple, dignified and architecturally correct. Frame and Sash are so designed as to combine sufficient strength with the maximum obtainable of daylight opening. Sash provided for glazing from inside. Construction is rigid and permanent—it being impossible for the corners of sash or frame to open. Mitres, copes, tenons, and all other intersections are precision-gauged and machined; members are carefully fitted and assembled, and each unit thoroughly inspected before shipment. Workmanship is assured thru employment of artisans trained in handling fine ornamental bronze work.

The "Polachek" Double Hung Window is produced in two types:

FIRST TYPE as illustrated on page 6 with no trim, plaster adjoining jamb of the window as shown by the letter "A". In this type, a part of the jamb is removable for access to the weight box, as indicated.

SECOND TYPE provides a metal trim on the inside which gives the window a more pleasing appearance. This trim is removable for easier access to the weight pocket as indicated by letter "B". This type can be furnished with a moulded trim, as indicated by letter "C" or with a trim returning to plaster, as indicated by letter "D", to meet special conditions.

Moulded or plain extruded metal stools, if required, will be provided for any of the above types.

We have designed, for each of the above types, three sets of die sections for horizontal sash rails for varying widths of windows.

STANDARD EQUIPMENT: The frames are fitted with heavy, galvanized iron, asphaltum-coated weight boxes; roller-bearing, overhead-type pulleys in heavy housings bronze faced to match frames; cast-iron weights and Hercules finish or hot galvanized, extra-heavy, steel sash chain, plated to match frames.

Each window is fitted with two sash lifts, one sash lock, one sash pull and four sash bumpers —all heavy, solid bronze, nickel or aluminum to match windows.

STANDARD EXTRA EQUIPMENT: (—) Cleaner's safety hooks and belts, (—) sash pull hooks on wood poles, (—) shade brackets, (—) curtain rod brackets and rods, and (—) drapery hooks.

SPECIAL EXTRA EQUIPMENT: Fly Screens, Wind Shields, Awning Brackets, Venetian Blind Supports, Radiator Brackets and Hoods or Enclosures, with or without grilles.

Special Steel Double Hung Windows are also manufactured by the Corporation. Details upon request.

The "POLACHEK" PATENTED CASEMENT WINDOW is another exclusive product of General Bronze Corporation and embodies the same standards of Good Construction, Excellent Workmanship and Permanent Service. It is so designed and fabricated as to produce continuous three-point contact throughout the sash perimeter, when closed. Patented in the U. S. March 9, 1929.

Frame, sash and trim throughout are of extruded metal from special dies.

The Corporation also makes a casement window, the stiles and rails of the sash being tubular-shaped (closed section) of drawn metal, which is also a three-point contact type, as illustrated on page 9. The tubular-shaped members add strength and rigidity to the sash and a more finished appearance when the sash is open and are specially adapted to large casements and casements extending to the floor that serve as doors.

THE CORPORATION'S SPECIAL PROJECTED TYPE CASEMENT WINDOW WITH BOTTOM VENTILATOR, as illustrated on page 12, offers to Architects and discriminating Owners what may well be termed the last word in controlled window ventilation. The advantages of the bottom ventilator sash, opening in, are too obvious and well understood to require discussion. The upper sliding pivoted sash, opening out, have a wide range of adjustment. The adjustor bar on each sash has four automatic positive locked positions, from none of which can any force applied to the sash release it; so that all danger of damage from gusty wind is eliminated. Yet a slight pressure on the push button instantly frees the bar to permit the sash to be swung to any new position desired.

At the first opened position, as illustrated at the bottom of page 12, it will be observed that the flanges on the meeting stiles of the two sash are still in contact, and that the hinged stiles have not yet been freed from contact with the jambs of the frame. This position creates a flue in which stale air rushes out the top and fresh air comes in at the bottom, insuring constant ventilation with no direct breeze or draught blowing into the room. The three further opened positions successively increase the open air exposure, the final one affording almost 100% clear opening.

When in this fully opened position, as may be noted by referring to the drawings, both sides of the glass may be easily washed from inside the room.

By closing one of these two sash and opening the other, any breeze traveling approximately in the same plane as is the wall, will be trapped and may be deflected into the room at any one of four angles.

A noteworthy feature of this window is the remarkable smoothness with which the sash operate, a smoothness accomplished by a unique arrangement of built in sliding pivot blocks and pivots of a special tempered self-lubricating alloy. Fully housed within the construction, it is impossible for this equipment to become untracked or jammed.

This window can be obtained without ventilator sash, with ventilator sash at the top, or at both top and bottom, as may be desired.

The superior weatherproof qualities of these windows are recognized and attested to by many Architects, Owners and Builders who have used them, and are apparent to the discerning eye from a careful study of the sections herein shown.

STANDARD EQUIPMENT: General Bronze Special Hardware, as illustrated on pages 13 and 14, is standard for all casements. Attractive, sturdy and efficient, it harmonizes perfectly with this most attractive type of window. Note particularly the absence of extreme projections and the general compactness of operating and engaging parts, not obtainable in other makes.

STANDARD AND SPECIAL EXTRA EQUIPMENT for casement windows is furnished the same as noted above for Double Hung Windows.

Complete architectural specifications and details also samples of "Polachek" Double Hung and Casement Windows will be supplied on request. We solicit the opportunity to quote on your requirements.

ART, ARCHITECTURAL, SCULPTURAL, DECORATIVE AND MISCELLANEOUS
METAL WORK OF EVERY DESCRIPTION

MADE BY THE

ORNAMENTAL BRONZE AND IRON TRADES

THESE products are specially manufactured to meet the most exacting demands of Architects' Plans and Specifications, Sculptors' Models and Artists' Designs. The Engineering methods of Bronze Construction and Bronze Working, which we employ in manufacture, preserve every art value of design while enhancing them with distinctive qualities of metalcraft.

We also develop standardized ARCHITECTURAL and BUILDING SPECIALTIES in METAL. These retain the same CLASS and QUALITY that distinguish our Special Work.

Our DESIGNING, DRAUGHTING, ENGINEERING, EXPERIMENTAL and RESEARCH Departments are open to the Profession in Developing Plans and Details as well as Assisting in the co-ordination of other Trades in connection with ORNAMENTAL METAL WORK—Contracted or Prospective.

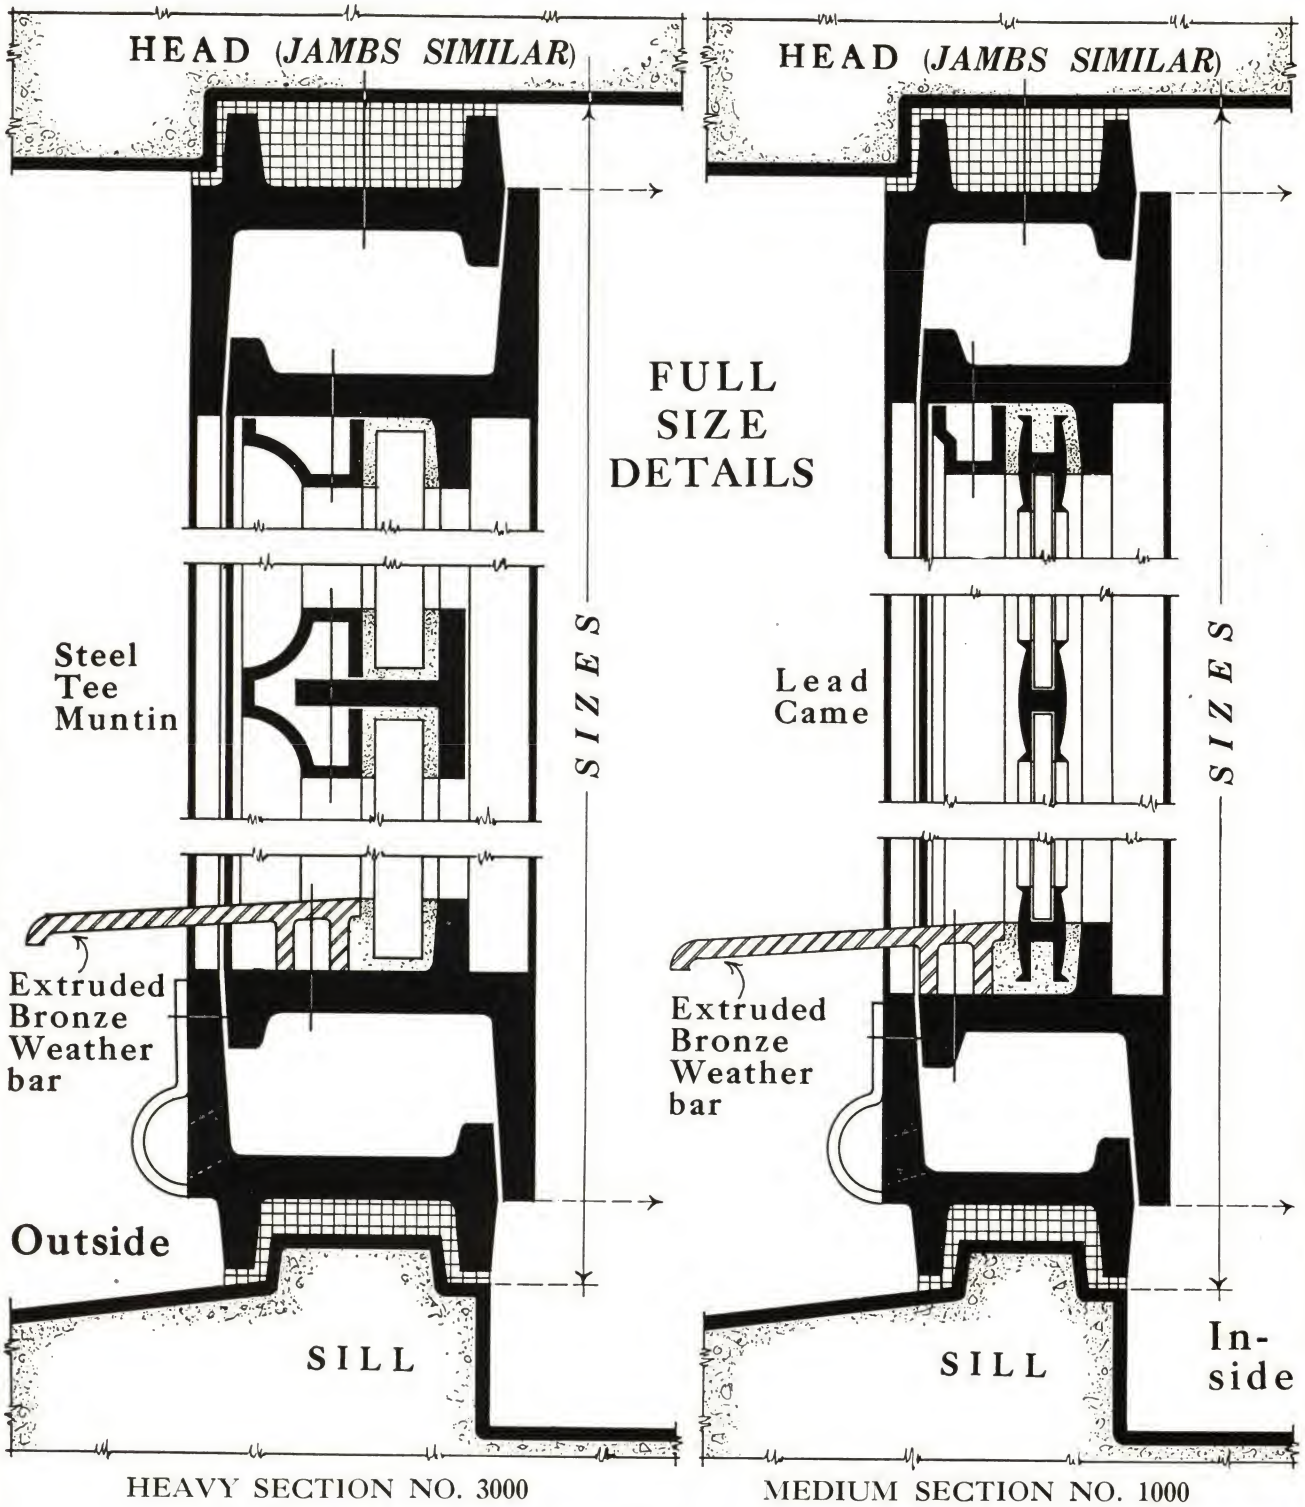
CASEMENTS OPENING OUTWARDS



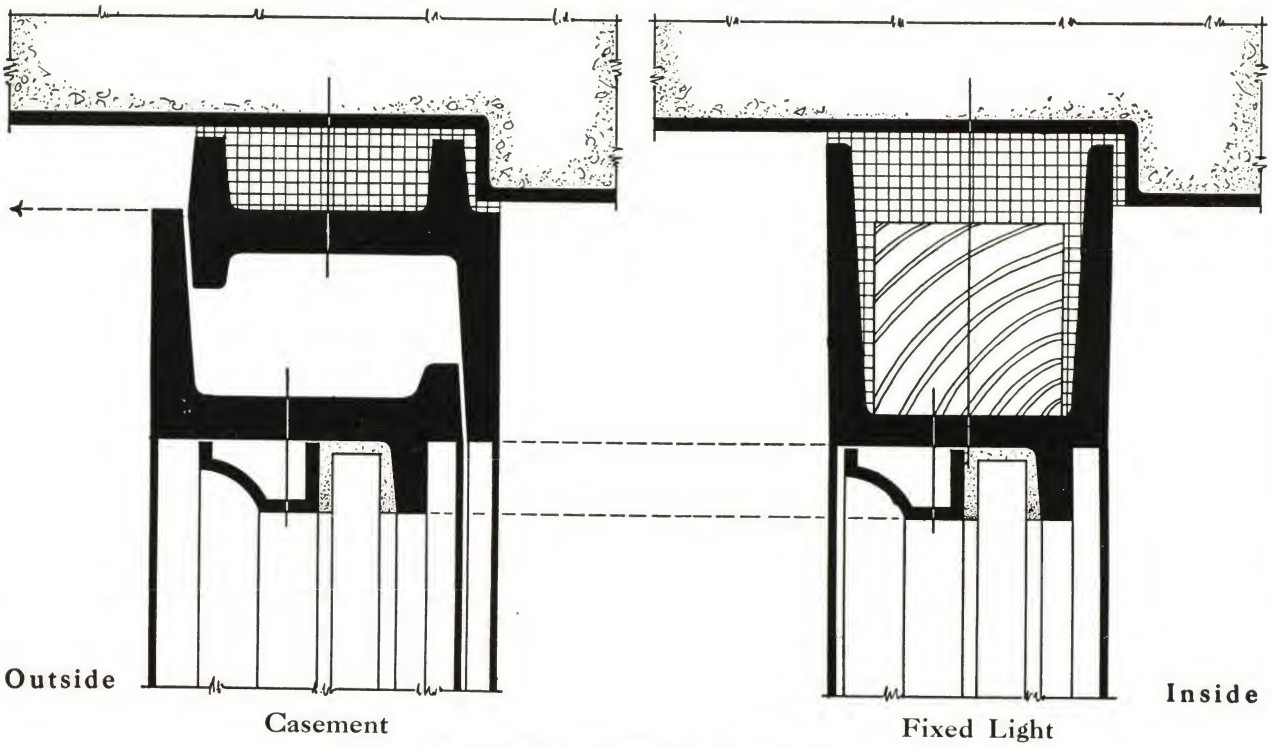
HEAVY SECTION NO. 3000
Maximum size 3′ 0″ x 8′ 0″.
Weight of combined sections 4.61 lbs. per lineal foot.

MEDIUM SECTION NO. 1000
Maximum size 2′ 6″ x 6′ 0″
Weight of combined sections 3.55 lbs. per lineal foot.

SIDE HUNG CASEMENTS—TOP HUNG CASEMENTS SIMILAR

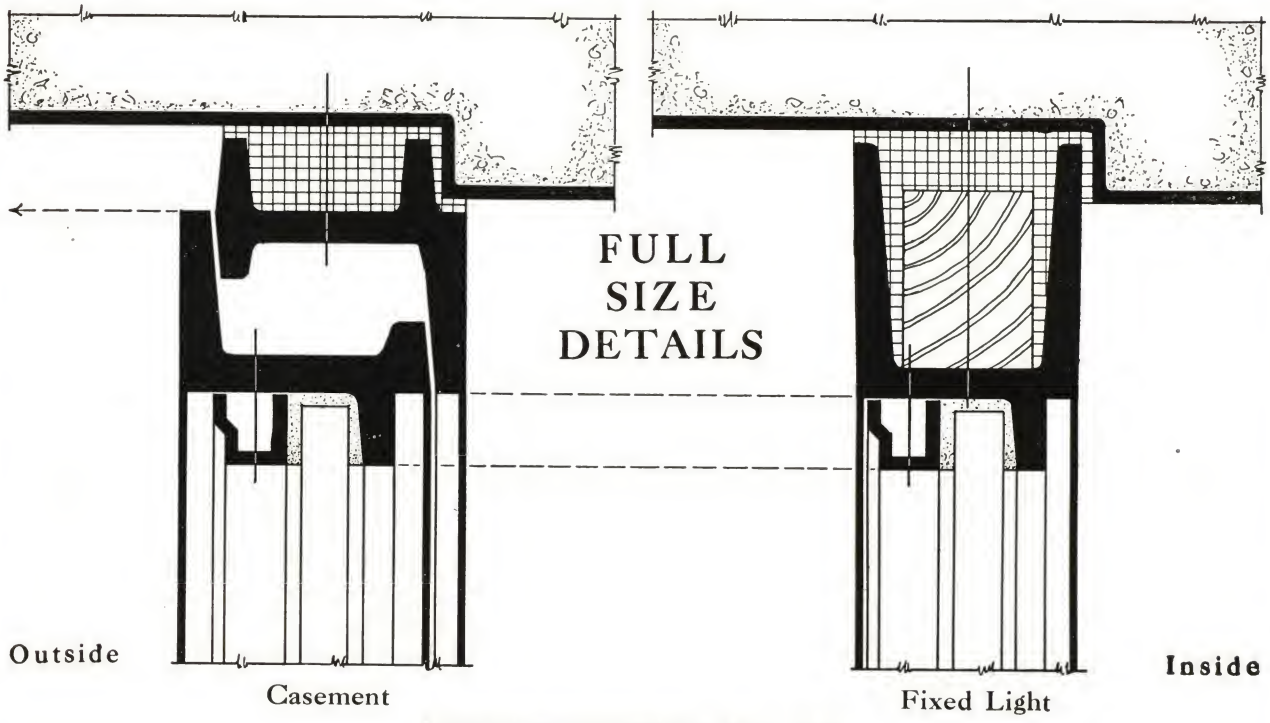
Our sections No. 3000 and No. 1000 may be glazed either from outside or from inside. Appearance usually governs choice, but we recommend outside glazing.

CASEMENTS OPENING INWARDS



HEAVY SECTION NO. 3000 MEDIUM SECTION NO. 1000

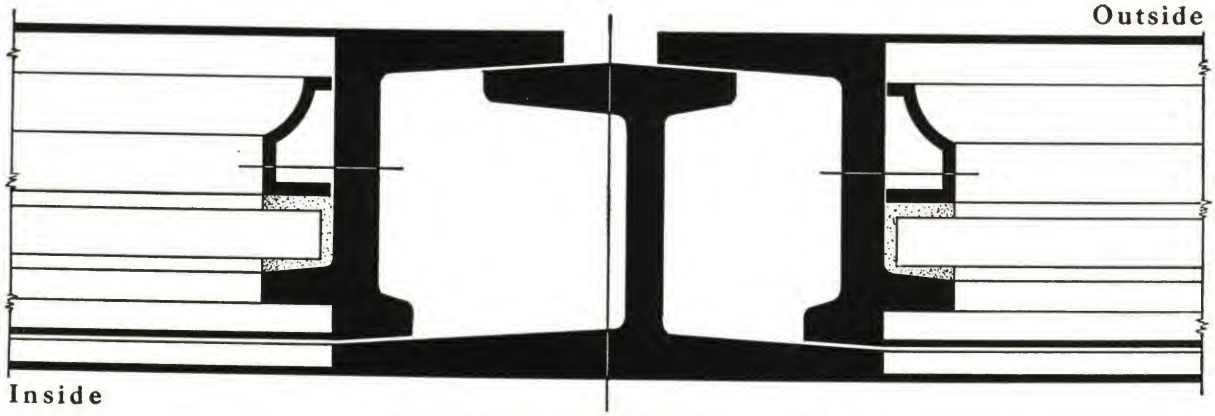
For maximum sizes and weights of sections, see preceding page



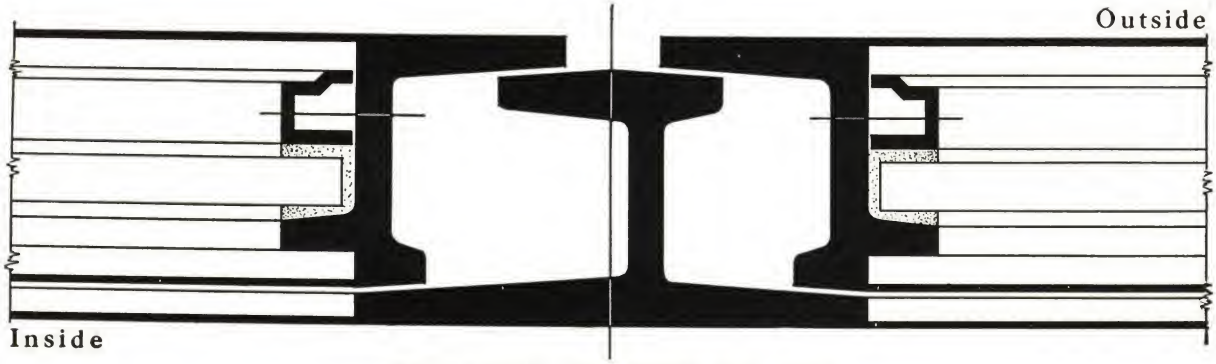
SIDE HUNG CASEMENTS—BOTTOM HUNG CASEMENTS SIMILAR

Our sections No. 3000 and No. 1000 may be divided into panes by tee bar muntins, or they may be prepared to receive leaded glass or single sheets of plate glass. For casements with large sheets of glass, and for all best work, we recommend glazing beads.

FIXED LIGHTS

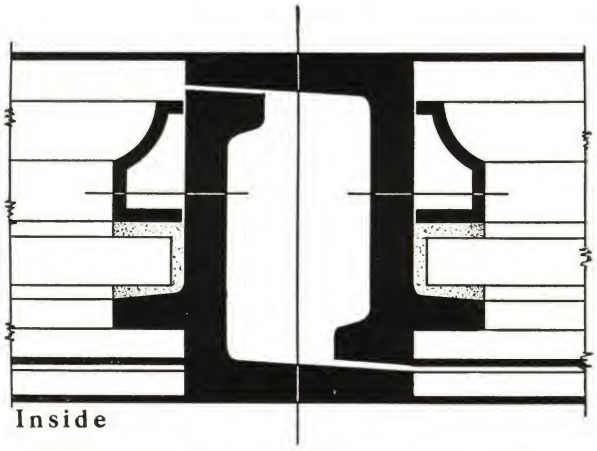


HEAVY SECTION NO. 3000

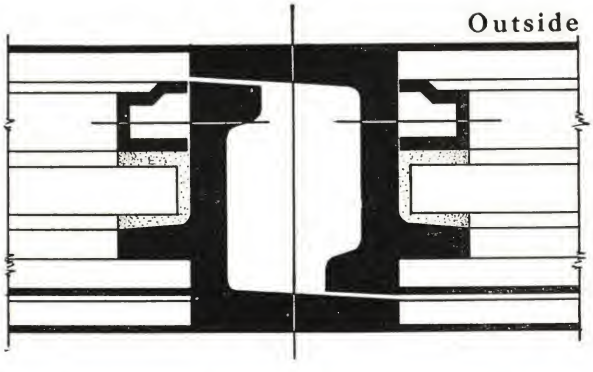


MEDIUM SECTION NO. 1000

Fixed lights are of solid rolled channel sections with sight lines and glass plane designed to match and line up with the corresponding features of the casements.



MULLIONS AND MEETING BARS



MULLION SECTION NO. 3000

MULLION SECTION NO. 1000

MEETING BAR SECTION NO. 3000

MEETING BAR SECTION NO. 1000

FULL SIZE DETAILS

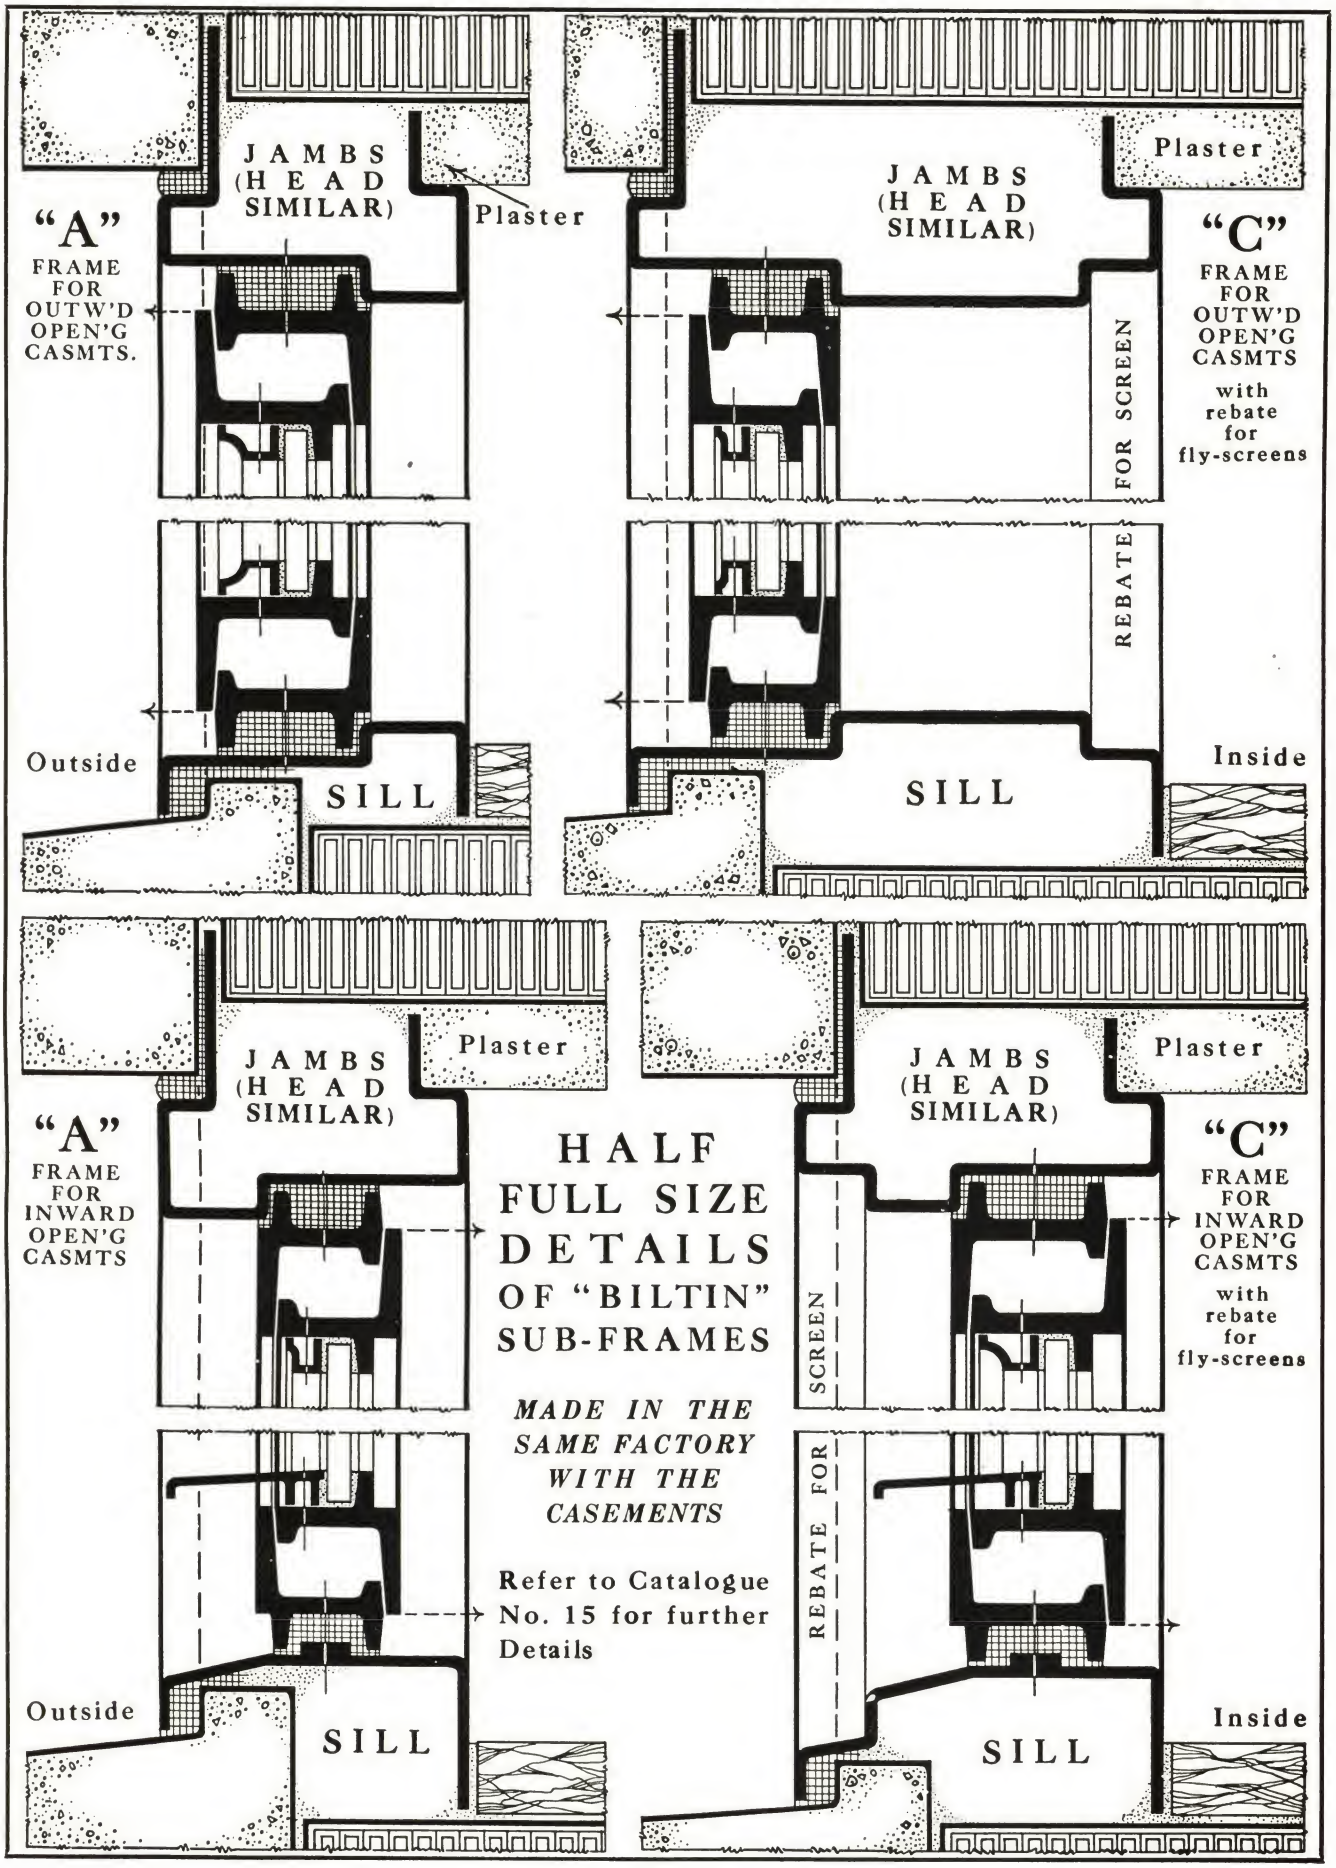
These mullions and meeting bars are shown for outward opening double casements. They will be reversed for inward opening casements. Glazing is shown from outside, but inside glazing can be arranged for by reversing the sections.

SPECIFICATIONS

Form of Specification for Custom Made Casements

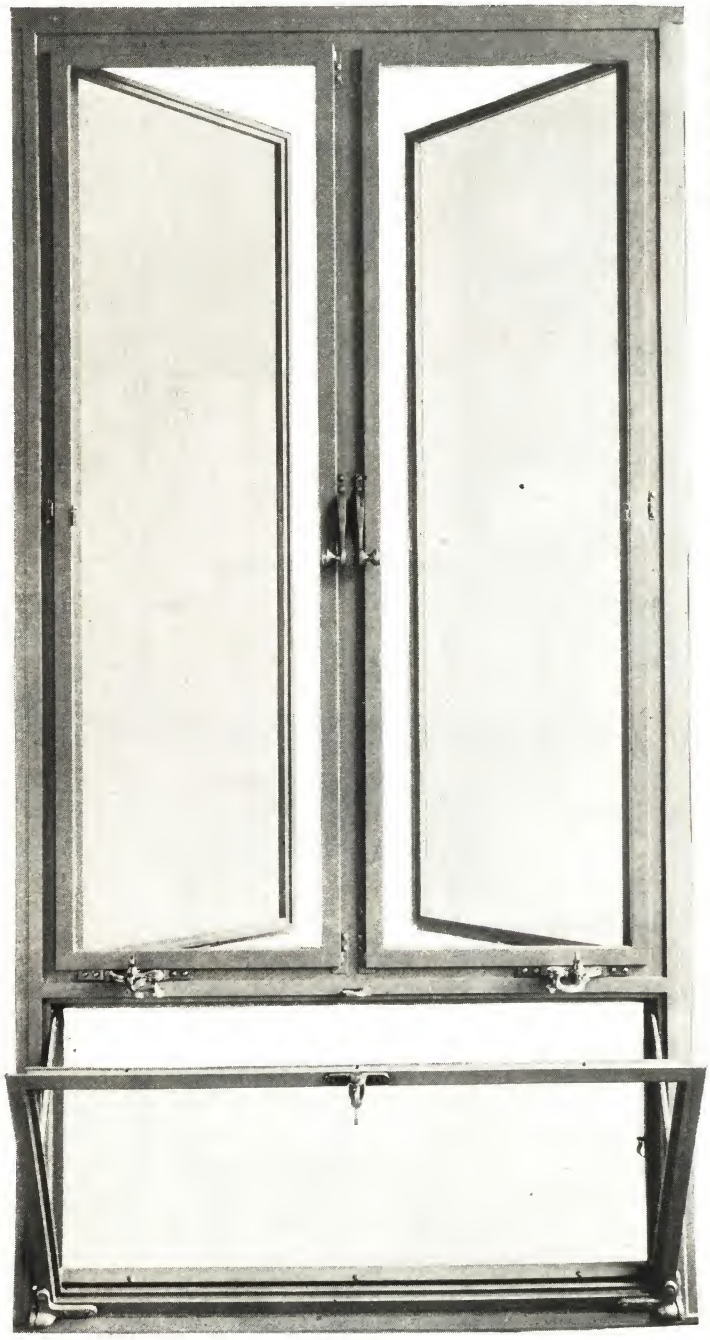
All windows shall be the INTERNATIONAL CASEMENT CO. INC. steel casement windows, manufactured in Jamestown, New York, and made from solid rolled steel sections of suitable design and weight for the size of the openings. This contractor shall not commence fabrication until shop drawings bear the approval stamp of the architects. All bars shall be hydraulically straightened and free from hammer marks or distortions of any kind. All corners shall be accurately machined, electrically welded and cleaned free from flux. Frames and casements shall be solid welded units and shall provide continuous double weathering contact without the aid of loose or applied linings. Horizontally and vertically pivoted casements shall be hung on patent bronze cup pivots. The former shall be fitted with solid bronze spring catch, cord eye and pulley and the latter with solid bronze fasteners and double bar adjusters; when more than 5 ft. high, double grip bolts shall be supplied. Top hung, bottom hung and side hung casements shall be hung on drop forged steel pivots bronze bushed. Top hung casements shall be fitted with solid bronze cam opener capable of convenient pole operation. Bottom hung casements shall be fitted with solid bronze spring catches and concealed friction side arms. Side hung casements both outward and inward opening over 5 ft. high shall be fitted with solid bronze fasteners having double grip bolts, double bar adjusters, and intermediate hinges: under 5 ft. the double grip bolts and intermediate hinges shall be omitted. All hardware shall be individually fitted by skilled mechanics at the factory. Fixed sash shall be made from channel sections which provide the same sight line and glass plane as the casements. Moulded steel glazing beads attached with brass screws and having mitered corners shall be neatly fitted to casements and fixed sash. All steel work shall be cleaned free from rust and scale and painted two coats DuPont special rust-resisting paint, each coat baked on separately. The installation of the windows shall form part of this contractor's work. Windows to be properly bedded and pointed inside and out with International mastic cement, the whole guaranteed weathertight. Glass and glazing by glazing contractor; field painting by painting contractor.

Form of Specification for "Biltin" Sub-frames

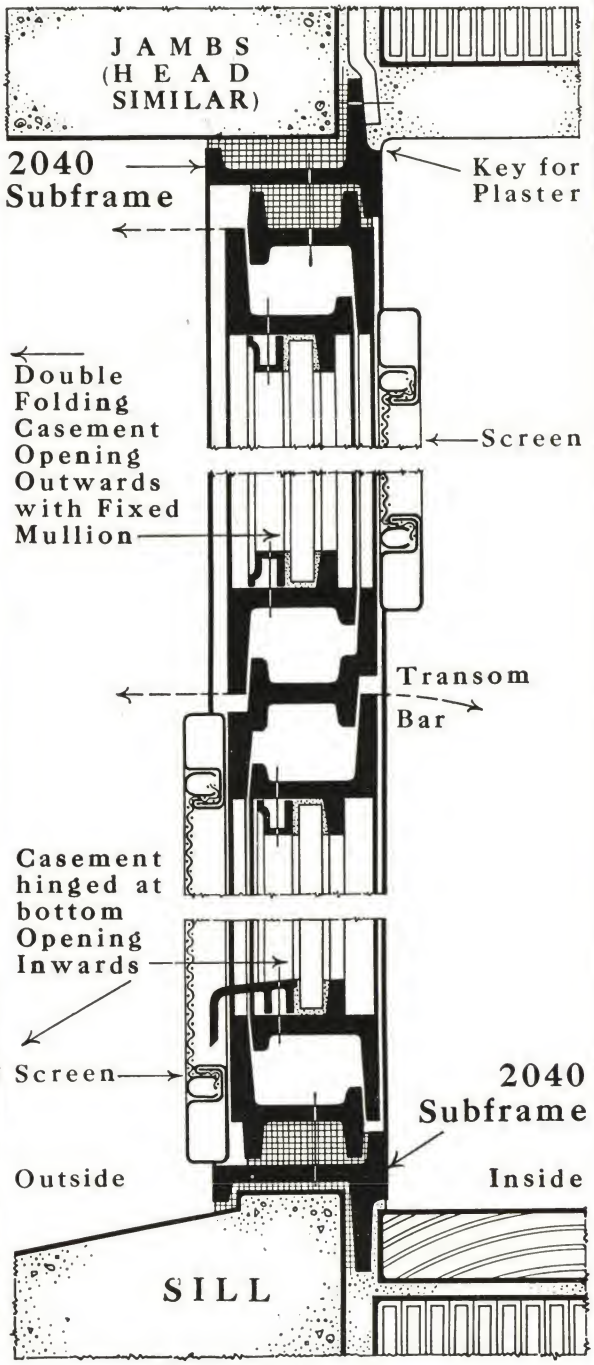


All sub-frames, mullions, transom bars, swinging and stationary sash, to be of steel, bronze or aluminum as manufactured by the INTERNATIONAL CASEMENT CO. INC., Jamestown, N. Y.

This contractor shall furnish and deliver to the building International "Biltin" sub-frames of type and profile shown on drawings, in time to suit the requirements of the building. Sub-frames shall be of No. 12 gauge steel, with corners welded solid to form one complete frame, except where of too great a size for shipment in ordinary box cars, in which event they shall be assembled at the factory with screwed and plated joints, dissembled, packed and shipped "K. D." for assembly by general contractor. All corners shall be properly cleaned off and the sub-frames shall be painted two heavy coats of special rust-resisting paint, each coat separately baked on. They shall be set up plumb and true and built in and pointed by the mason contractor as the walls go up. The wood spreaders or braces which are included to insure the sub-frames hold square and true to shape shall be left in until the casements are installed.



After plastering is completed, this contractor shall remove braces and shall install casements, taking care that the joints between the casements and the sub-frames are properly filled with International Mastic Cement neatly pointed inside and out. All casements shall be properly adjusted and shall operate freely and smoothly before acceptance by the architect.



Please refer to our branch offices for specifications covering bronze or aluminum.

Standard Cotswold Casement specifications are given on Page 11.
Screened Casement specifications are given on Page 12.

THE "HOPKINS" WINDOW

Half Full Size Section

THE "HOPKINS" WINDOW

Made in custom and standard sizes

The International "Hopkins" Window (illustrated above) is particularly suitable for public buildings, hospitals, courthouses and schools where permanency of construction, control of ventilation and simplicity of operation are desirable. The frames and casements of these windows are solid welded units and continuous double weathering contact is provided without the aid of loose or applied linings. This method is more expensive than the forming of contacts by the riveting or spot welding of separate linings, but it ensures permanent construction and avoids the troubles which follow when linings are forced away by corrosion, leaving the windows useless and sometimes dangerous.

The section used is our Medium Section 1000 having a combined weight of casement and frame of 3.55 lbs. per lineal foot.

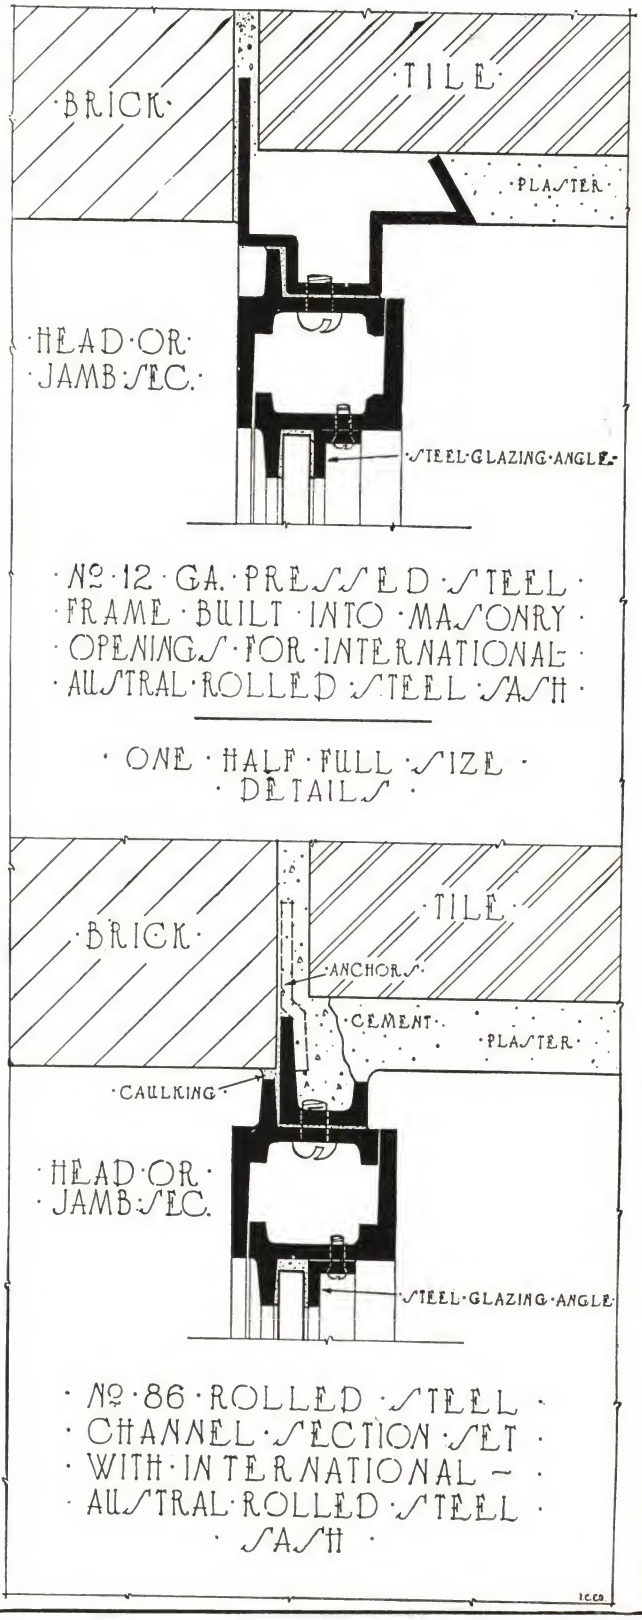
Note: *For full specifications, refer to Booklet No. 18 or to any of our offices.*

INTERNATIONAL AUSTRAL WINDOWS

In Steel and Bronze for Office Buildings and Schools

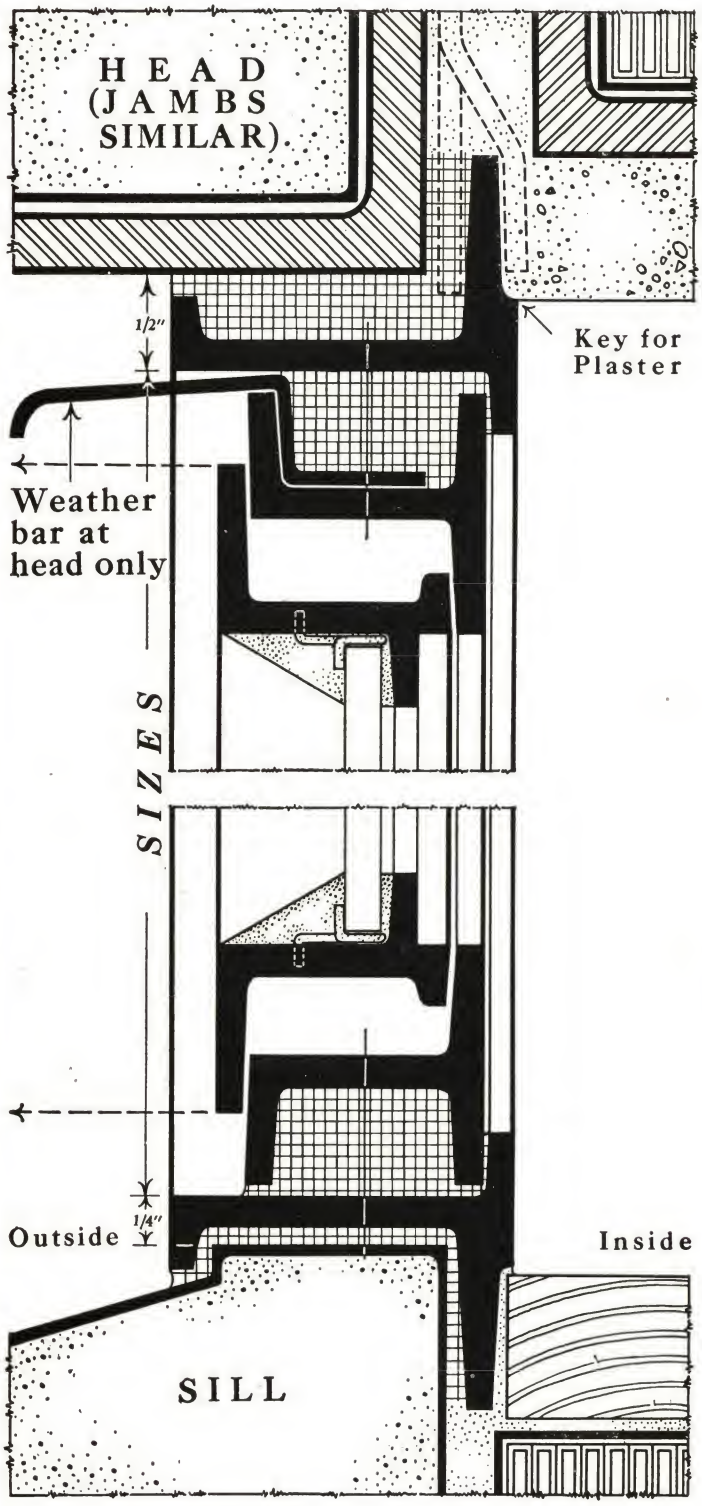
GIRLS' SENIOR HIGH SCHOOL, ATLANTA, GA.
EDWARDS & SAYWARD, Architects

Specifications International Austral Windows



Windows where marked on plans to be copper-bearing steel with Austral balance arms as manufactured by the INTERNATIONAL CASEMENT CO. INC., Jamestown, N. Y. Sub-frames of No. 12 gauge steel, with welded corners, painted two priming coats, each coat separately baked on, to be delivered to building site, but same to be set up, built in and calked by mason contractor.

Sash to be of special shapes, made of copper-bearing steel. All bars hydraulically straightened, corners electrically welded and cleaned free from flux.



Frames and sash carefully fitted to insure absolute weathertightness. Fit with steel glazing beads (glass stops) set with brass screws. Clean all steel work free from rust and scale and paint two heavy priming coats, each coat separately baked on.

This contractor shall furnish all necessary hardware and fittings as follows: galvanized drop-forged steel window cleaner's bolts, shade brackets for both upper and lower sash with roller guides to hold cords. Polished cast bronze automatic cam catch and pull. The sash shall be erected by this contractor after the plastering is completed. Same to be bedded and pointed in mastic cement and secured to sub-frame by machine screws. All to be finished in a workmanlike manner and guaranteed weathertight.

Note: *For complete specifications and details refer to our Austral Window Catalogue No. 13.*

ROLLED STEEL SUB-FRAMES NO. 2040

FULL SIZE DETAILS

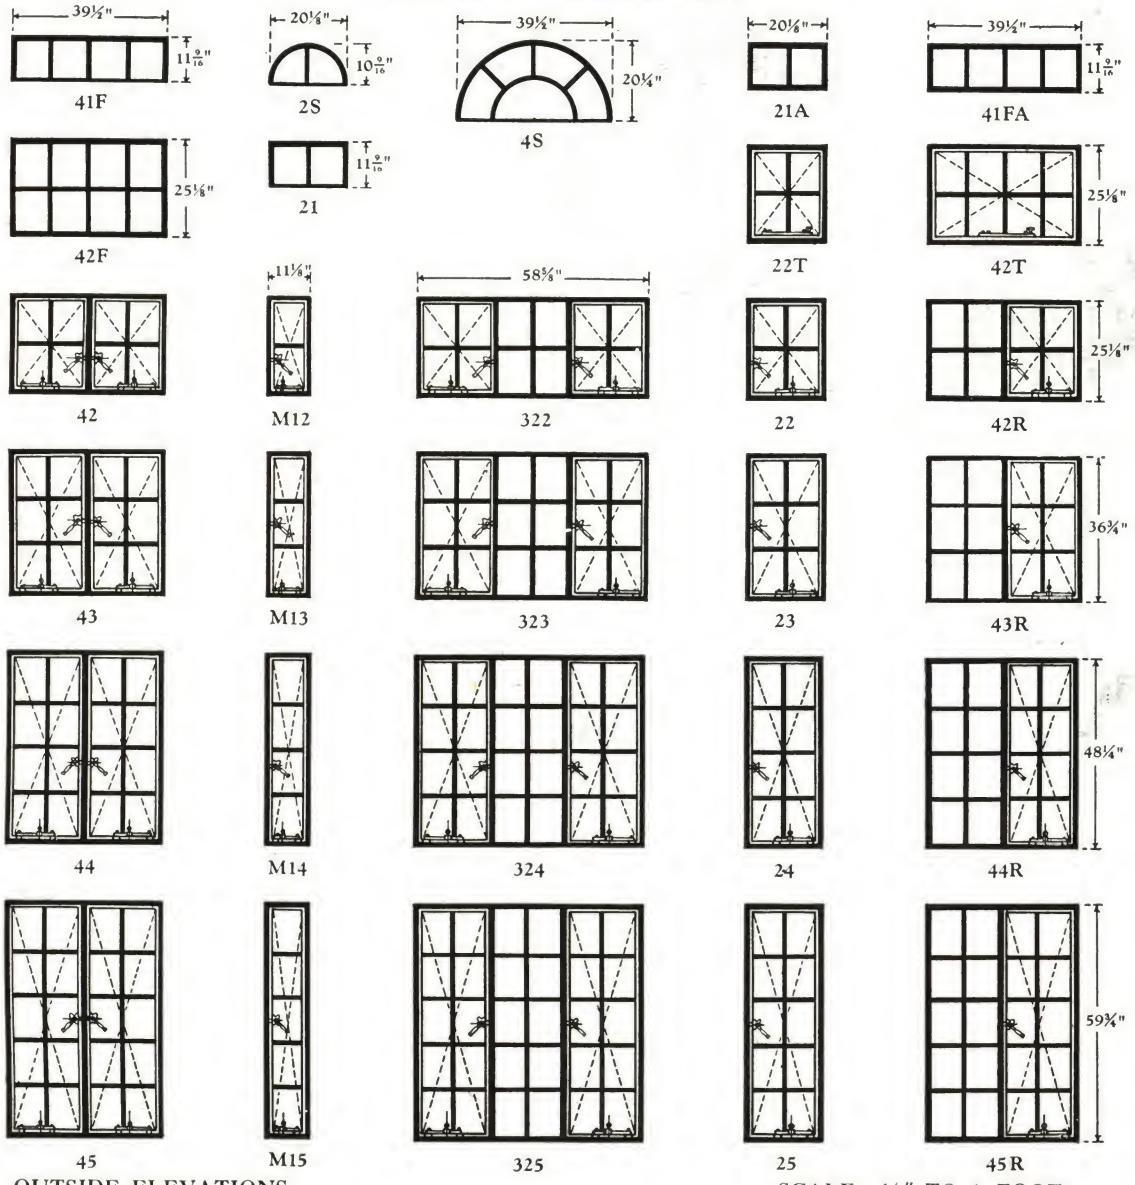
Showing a standard Cotswold Casement installed in a Standard No. 2040 sub-frame.

In 1920 we designed a solid rolled steel No. 2040 sub-frame for use in masonry openings having plastered reveals, where a narrow sight line was desirable and where low cost was an important factor.

Bonded into the masonry openings as the walls are being built, this sub-frame provides a perfectly weathertight joint and permits the plastering to be completed before the casements are installed.

It has enjoyed nation-wide acceptance and is a big improvement over the construction which requires loose angle linings, without being very much more expensive.

We keep No. 2040 sub-frames in stock in standard sizes for use with our Cotswold range of standard casements. They can also be supplied in custom shapes and sizes at a slight extra cost.



Form of Specification for No. 2040 Rolled Steel Sub-frames

All casement windows and sub-frames shall be of sold rolled steel sections as manufactured by the INTERNATIONAL CASEMENT CO. INC., Jamestown, N. Y.

This contractor shall furnish and deliver to the building International "No. 2040" sub-frames to the shapes and sizes shown on the drawings. When specifying 2040 frames for Standard Cotswold Casements, specify that they are to be in standard types and sizes as shown by reference numbers on elevations in accordance with the standards established by International. They shall be painted two heavy coats of special rust resisting paint, each coat separately baked on, and they shall be delivered to the site in time to meet the requirements of the building. They shall be set up plumb and true and built in and pointed by the mason contractor as the walls go up. The wood spreaders or braces which are included to insure the sub-frames hold square and true to shape shall be left in until the casements are installed. After plastering is completed, this contractor shall remove braces and shall install casements, taking care that the joints between casements and sub-frames are properly filled with International Mastic Cement neatly pointed inside and out. All casements shall be properly adjusted and shall operate freely and smoothly before acceptance by the architect.

Note: *For more comprehensive details, refer to Catalogue No. 15.*

STANDARD COTSWOLD CASEMENTS AND DOORS

OUTSIDE ELEVATIONS

SCALE: ¼" TO A FOOT

Casement Description

Types 41F, 2S, 4S and 21 are fixed sash and are suitable for composite units only. Types 21A, 41FA and 42F are also fixed sash but are suitable as transom lights in single openings. Types 22T and 42T are casements hinged at top opening outwards fitted with solid bronze peg adjuster. All other casements are hinged at side opening outwards. The single casements are shown as right-hand casements but can be supplied left-hand if desired. Types 42R, 43R, 44R and 45R are right-hand casements. They can be supplied with left-hand casements and will then be of the following corresponding types: 42L, 43L, 44L and 45L. The above are all fitted with tee-bar muntins.

Leaded Glass—All the above types can be supplied for use with leaded glass (muntins being omitted). See pages 10, 11 and 12 of the Cotswold Catalogue No. 14.

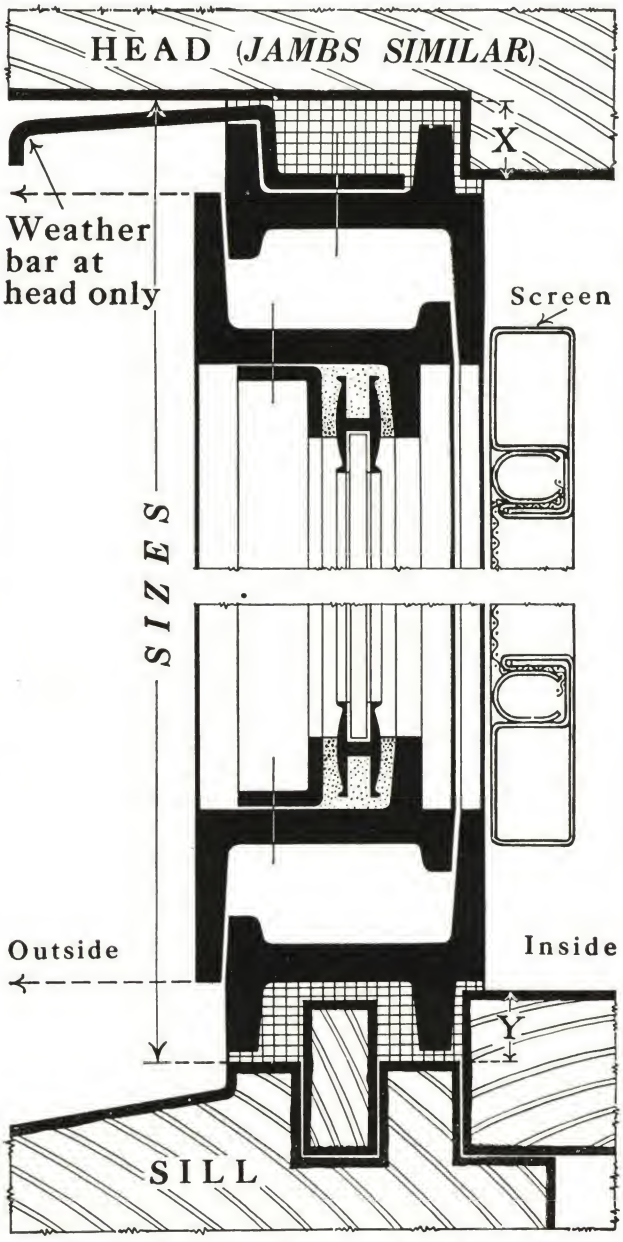
Cotswold Casement Specification

(1) Casements of Cotswold type, made from heavy two-point steel section (not Cottage Sections) hinged at side opening outwards painted two coats of rust resisting paint, each coat separately baked on, hung on drop forged steel pivots bronze bushed and fitted with solid bronze hardware of standard design.

(2) Furnish leaded glass of standard sizes and design, first quality D.S.A. glass ⅝-in. lead cames, all horizontal cames steel reinforced.

(3) If steel muntins are required omit paragraph 2 and specify steel muntins to be furnished.

(4) The whole to be set by sash contractor and guaranteed weathertight.



Cotswold Doors

For further information and details of Cotswold Casements and Cotswold Doors, see Catalogue No. 14.

INTERNATIONAL SCREENED CASEMENTS

SCREENED COTSWOLD CASEMENT, TYPE 33x0

FULL SIZE SECTION

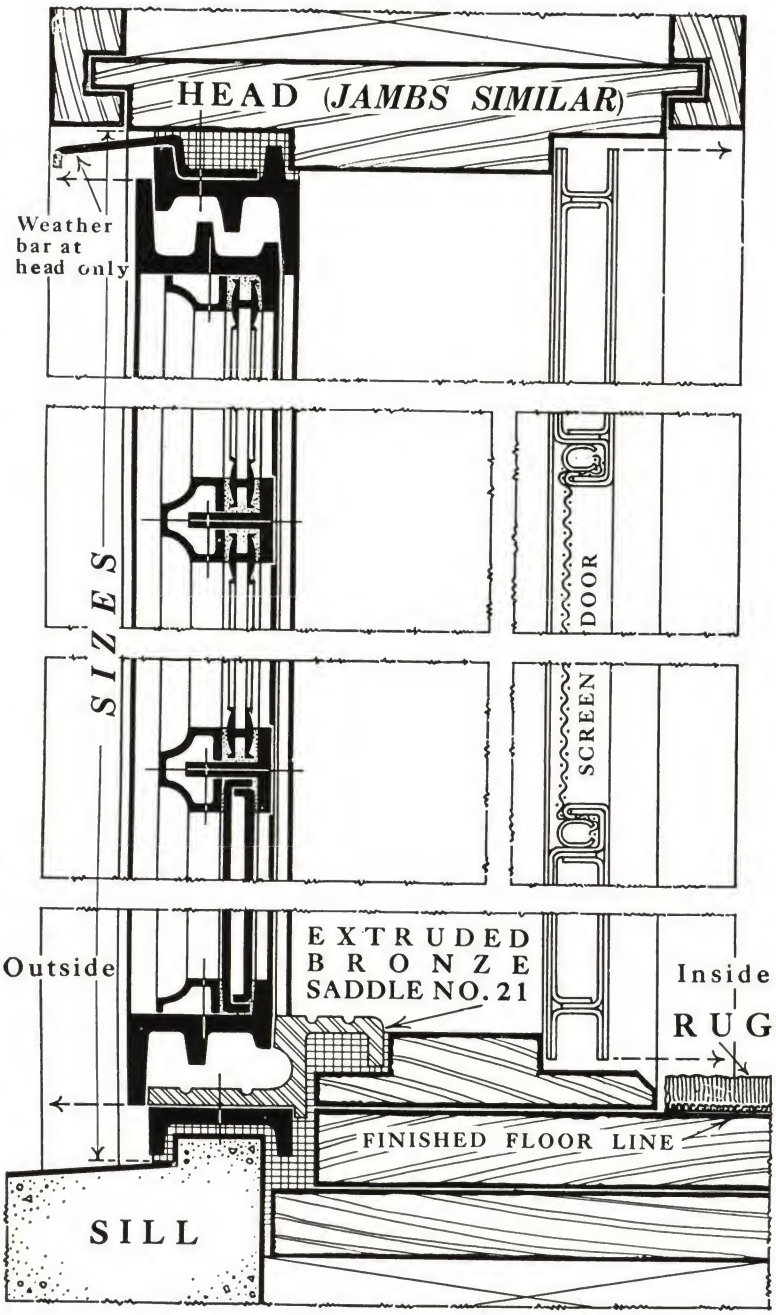
Maximum rebate including trim at head and jambs (dimension "X") 5/8 in.; at sill (dimension "Y") 1/2 in.

Specifications for International Screened Casements

All windows shall be International Solid Steel Cotswold Casements with integral screens as manufactured by the INTERNATIONAL CASEMENT CO. INC., Jamestown, N. Y., in the standard types and sizes they have established and as shown by reference numbers on the elevations.

(When specifying custom made casements, state that they are to be made to shapes and sizes shown on the drawings, and to consist of heavy three-point sections or Universal two-point sections, to suit the sizes of the openings).

All casements shall be hung on drop-forged bronze bushed steel pivot hinges of the projecting type, to facilitate cleaning, and shall be fitted with bronze casement fasteners and adjusters so designed and fitted as to permit the proper operation of the casement without any slots or holes through the screen. All steel work shall be painted one coat of special rust-resisting primer and one coat of gray, each coat baked on separately.

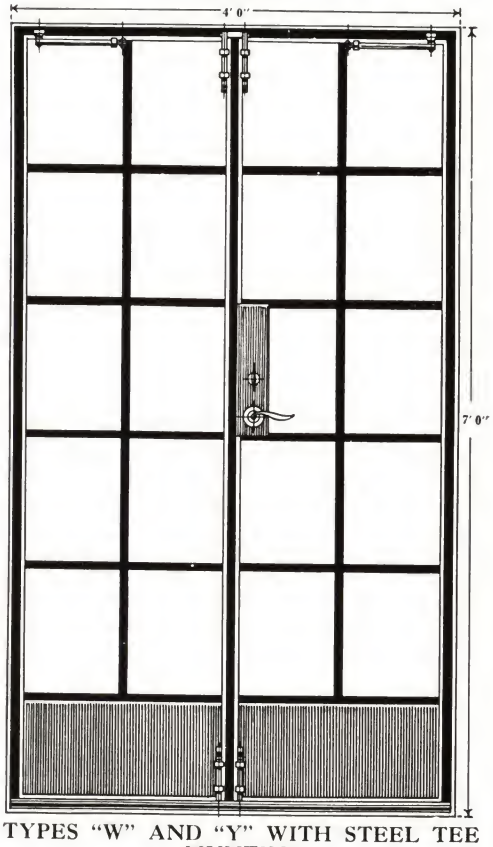


If casements with muntins are to be furnished, specify that the casements shall be divided into panes with rolled steel tee muntins. If leaded glass is to be furnished, refer to page 14 of International Cotswold Catalogue No. 14 for suitable specifications.

The screens shall be of standard sizes, as supplied by the INTERNATIONAL CASEMENT CO. INC., and shall be carefully packed and shipped separately. The screen frames shall be made from copper-bearing open hearth steel, 1x$\frac{7}{16}$ in. and tubular in construction, strongly welded and reinforced at each corner, and galvanized after all cutting and abrasive operations have been completed. The screen cloth shall be standard weight Old English gauge 16-mesh anaconda bronze wire, easily re-wirable.

The setting of the casements shall be done by the casement manufacturer after plastering is completed. They shall be bedded and pointed inside and out in mastic cement, the whole finished in a workmanlike manner and guaranteed weathertight.

Note: *For further information and details write for descriptive leaflet.*



CASEMENT DOORS IN STANDARD SIZES

HALF FULL SIZE SECTION

TYPES "X" AND "Z" WITH LEADED GLASS

TYPES "W" AND "Y" WITH STEEL TEE MUNTINS

Although these doors are made to open outwards or inwards, we do not recommend inswinging doors because of their unreliable weather-tight qualities under severe conditions. Outward opening doors, however, can be relied upon to give complete protection against all weathers even in the most exposed positions. For more complete details, specifications and photographs, please refer to our Catalogue No. 17.

In addition to the four doors shown on this page, we make Cotswold doors types "L" and "M," full descriptions of which appear in our No. 14 Catalogue.

WM. H. JACKSON COMPANY
335 CARROLL STREET,
BROOKLYN, N.Y.

"Artisans in all metals"

THE WM. H. JACKSON COMPANY has had over a hundred years of experience in metal work. During this very long period it has been among the pioneers in developing various products which form an important part of American Architecture. As a leader in the development of Extruded Bronze and Aluminum windows, the WM. H. JACKSON COMPANY has perfected various types which meet every requirement. Architects and Engineers throughout the country are using these windows in the finest types of buildings as they are accorded the distinction of being among the best windows manufactured.

Jackson's windows are made to a precision unattainable in other metals. They are air tight and water tight without the use of weatherstrips and operate at an efficiency never before attained. These windows are made so they can be installed after the masonry opening has been completed. All of Jackson's windows are made of Bronze or Aluminum. These enduring metals give them an unlimited term of service. The qualities of permanence and economy in upkeep make Jackson windows ultimately less expensive than windows of other materials. In addition, the heating cost of a building is reduced due to their weather tightness.

Full size drawings of all types of windows will be sent to Architects and Engineers on request. Our Service Department is at your disposal and will assist in working out any unusual window problems.

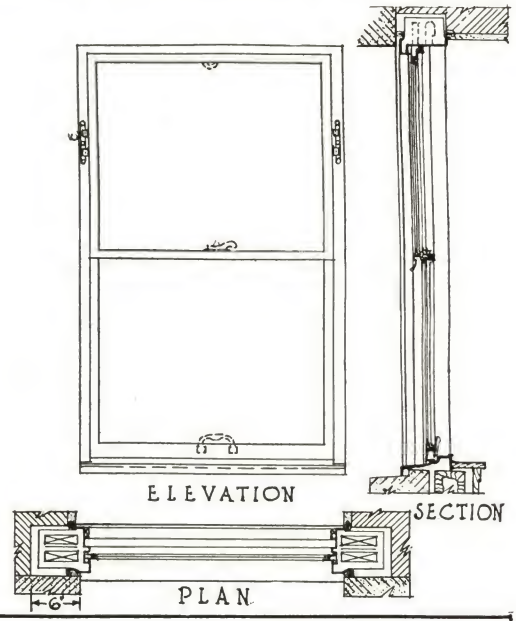
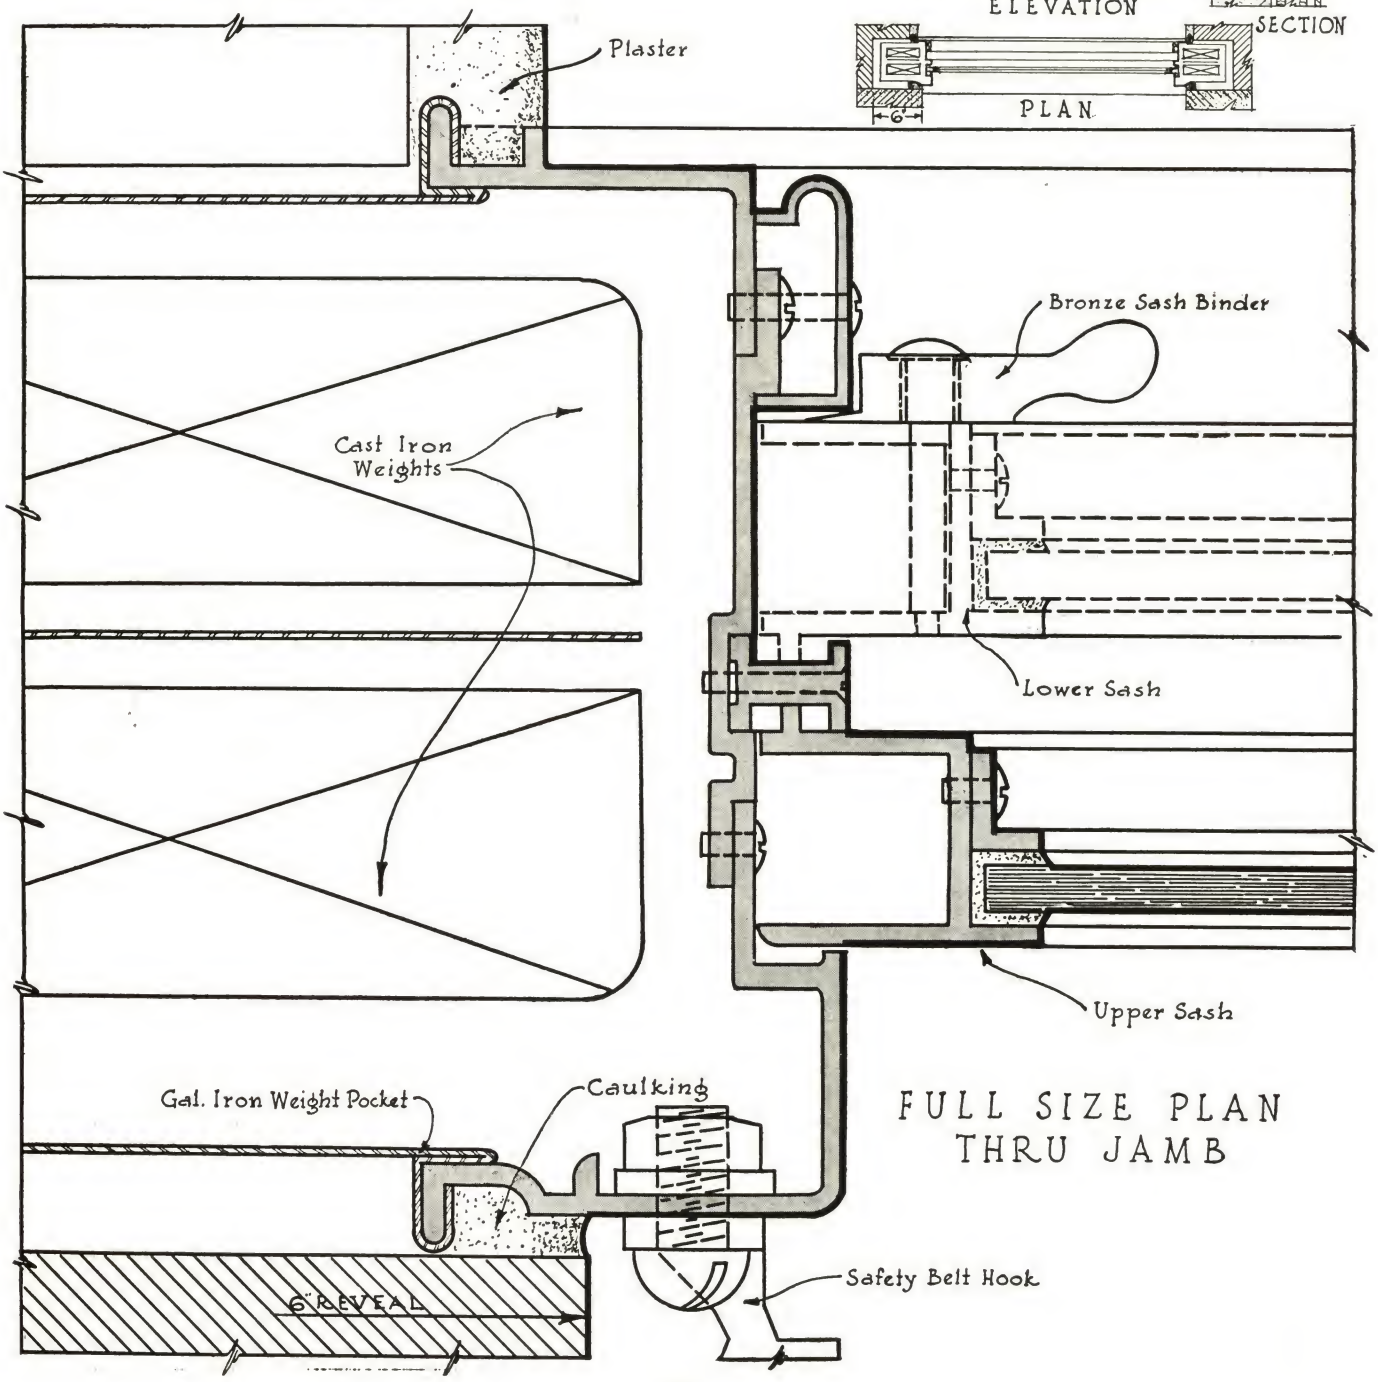
DOUBLE HUNG WINDOWS—TYPE H-2

(See Following page for Description)

Double Hung Windows



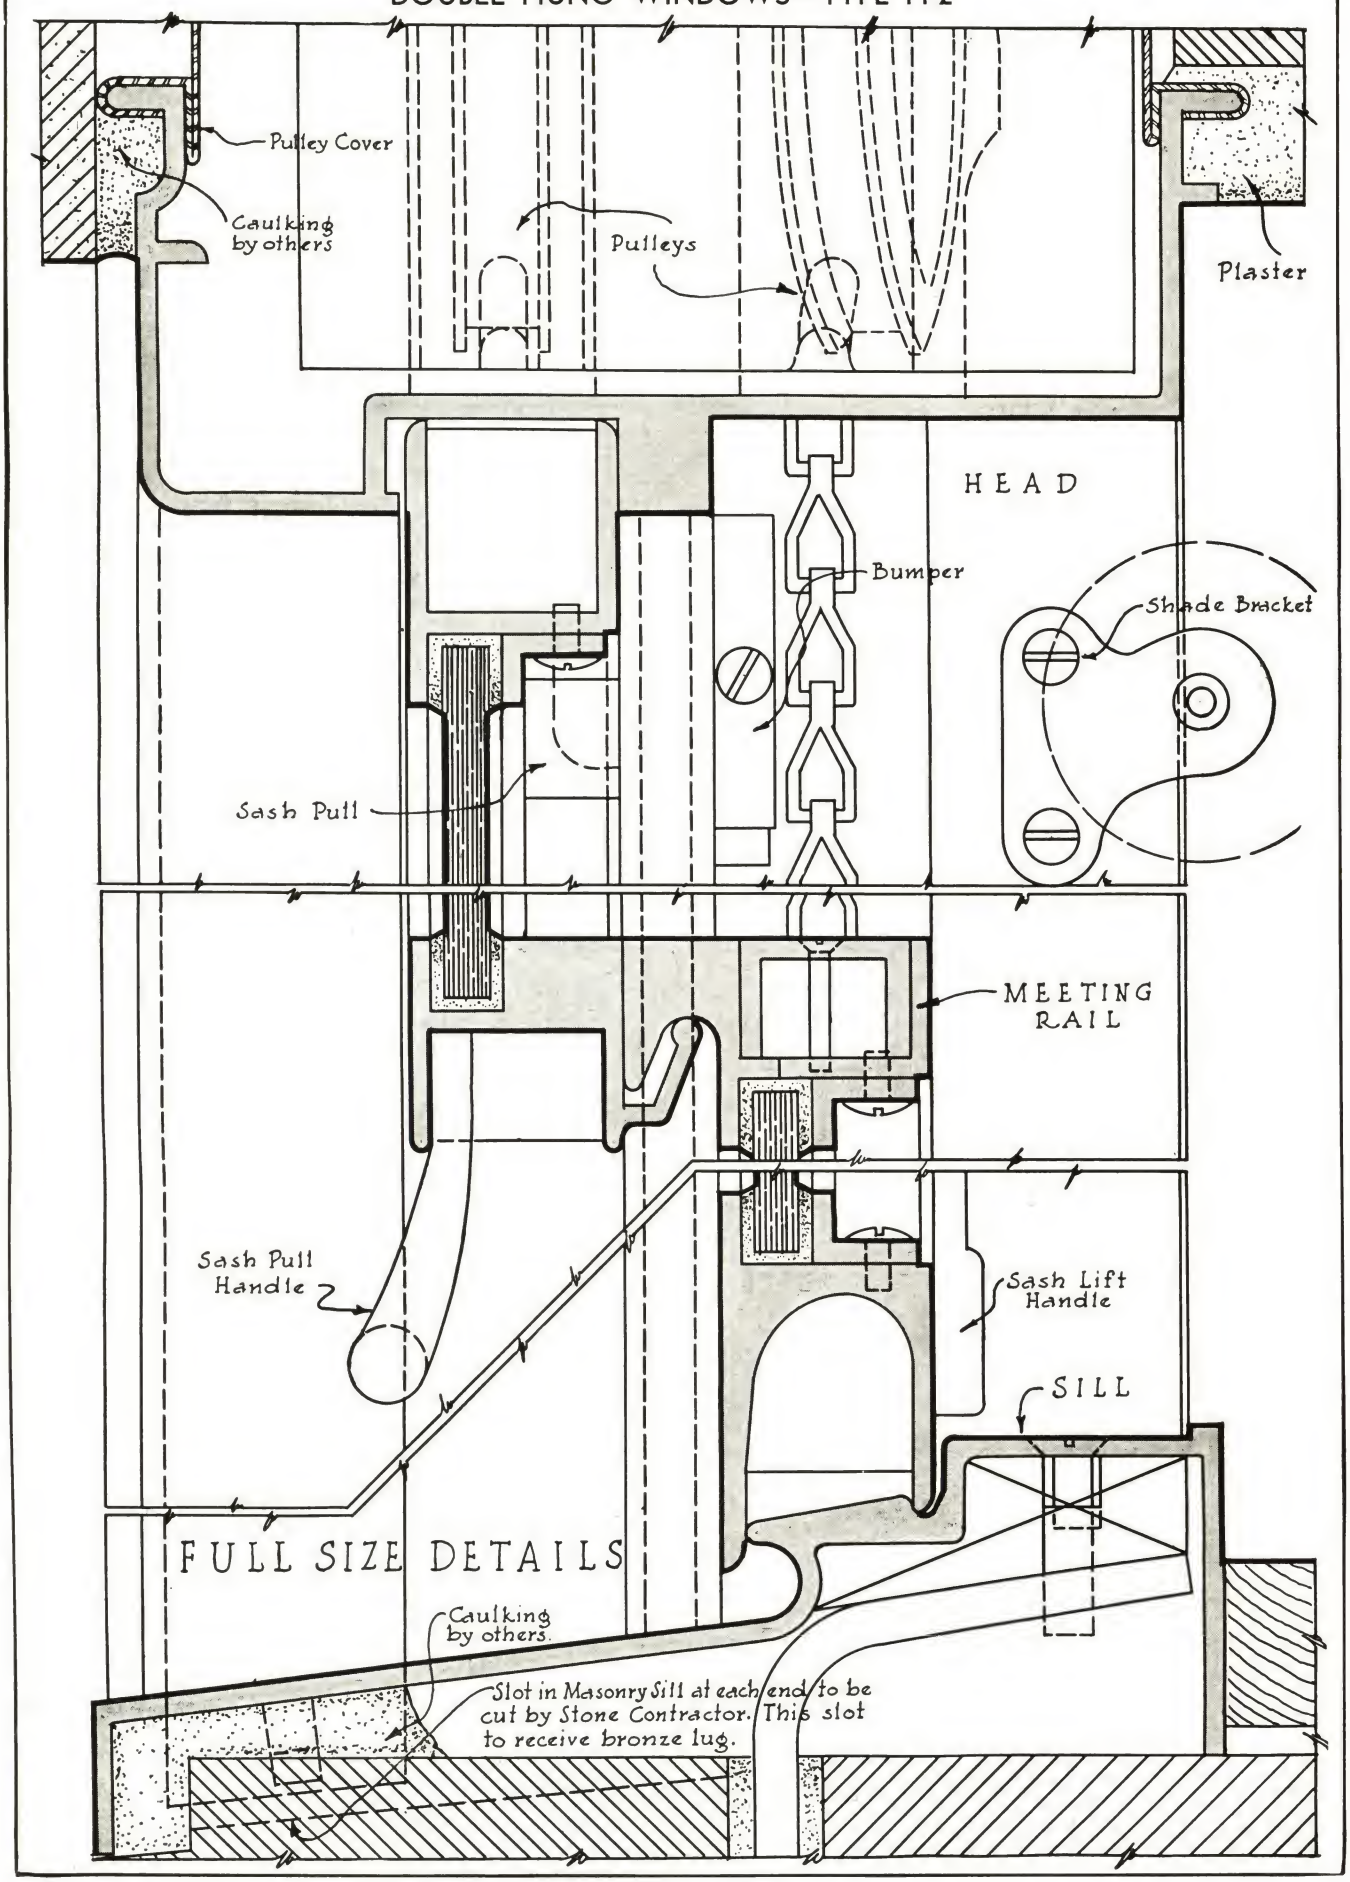
Standard Type H-2



(U. S. Pat. No. 1459668, June 19, 1923—Other Patents Pending)

The Double Hung Windows made by the Jackson Company in Bronze or Aluminum are unexcelled in quality and operate with the greatest of ease. These windows are provided with hardware that insures them against rattling in the strongest winds either when they are opened or closed.

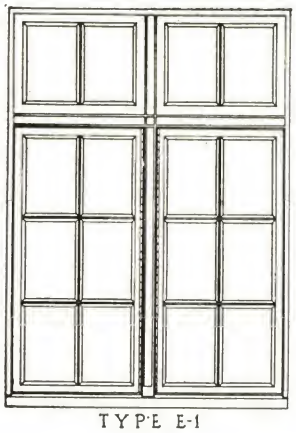
Fire Underwriters' Labels are issued on Jackson Type H-1 Bronze Double Hung windows which are similar in detail to Type H-2. (Write for details.) This is the only extruded bronze window approved by the National Board of Fire Underwriters.



See Specification page 12.

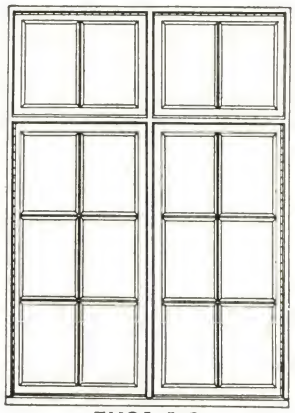
FULL SIZE PLAN THRU JAMB

DOUBLE HUNG WINDOWS—TYPE H-2



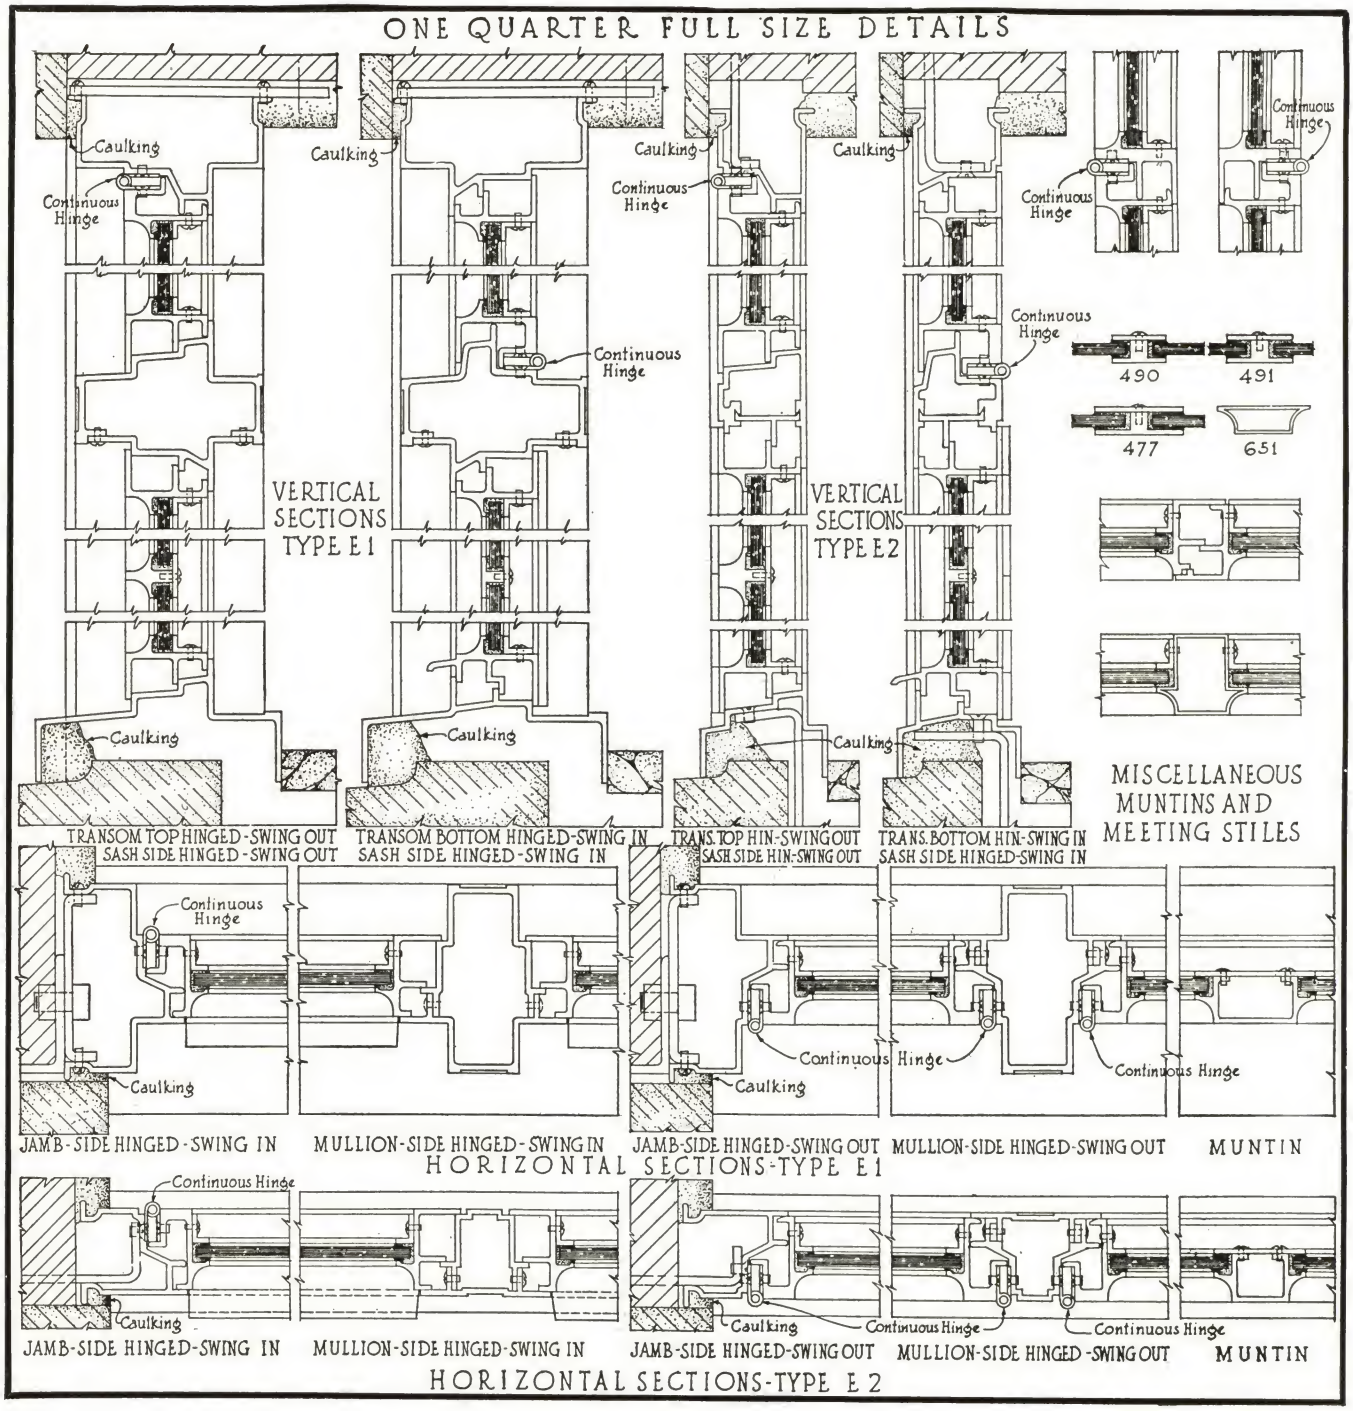
Standard Casement Windows

Types E-1 and E-2

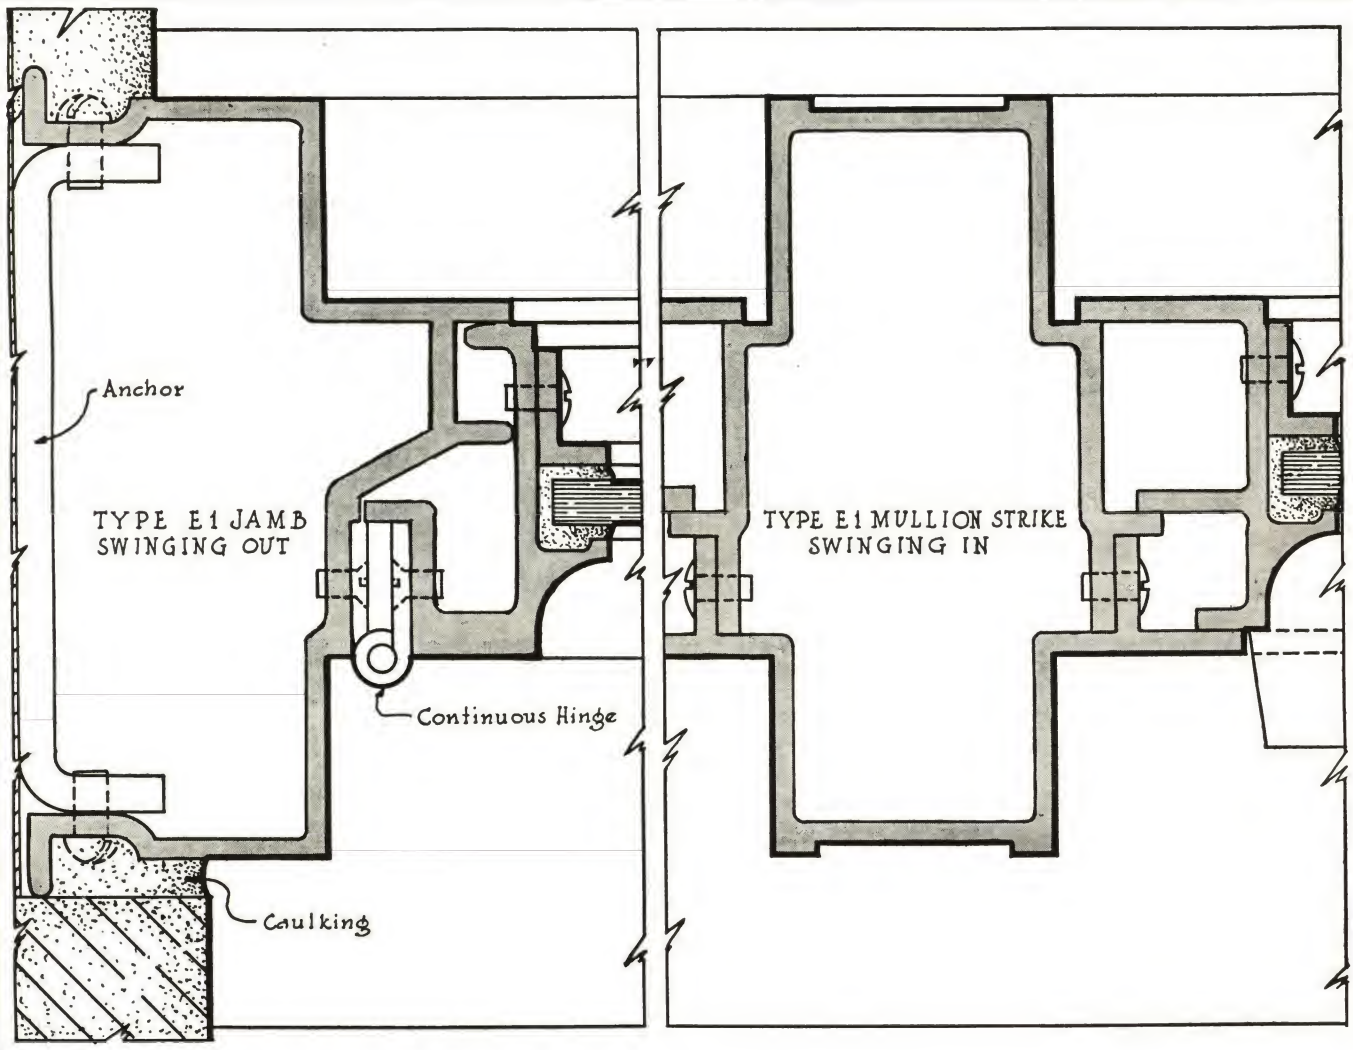


(U. S. Pat. No. 1568865, Jan. 5, 1926–Other Patents Pending)

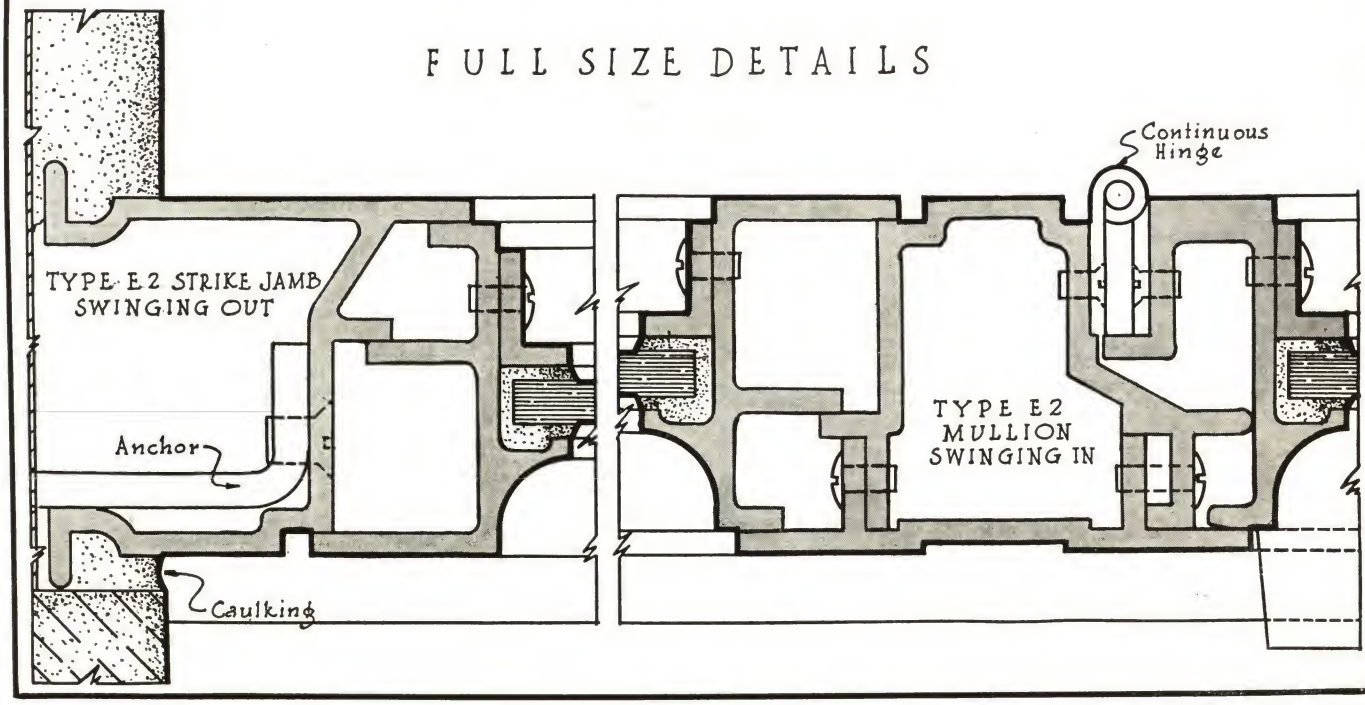
Where the architectural treatment demands the use of Casement windows, Types E-1 and E-2 made in Bronze or Aluminum are ideally suitable. They are used extensively in buildings for Banks, Insurance Companies and monumental structures of a character where the highest grade materials are required.



See Specification page 12.



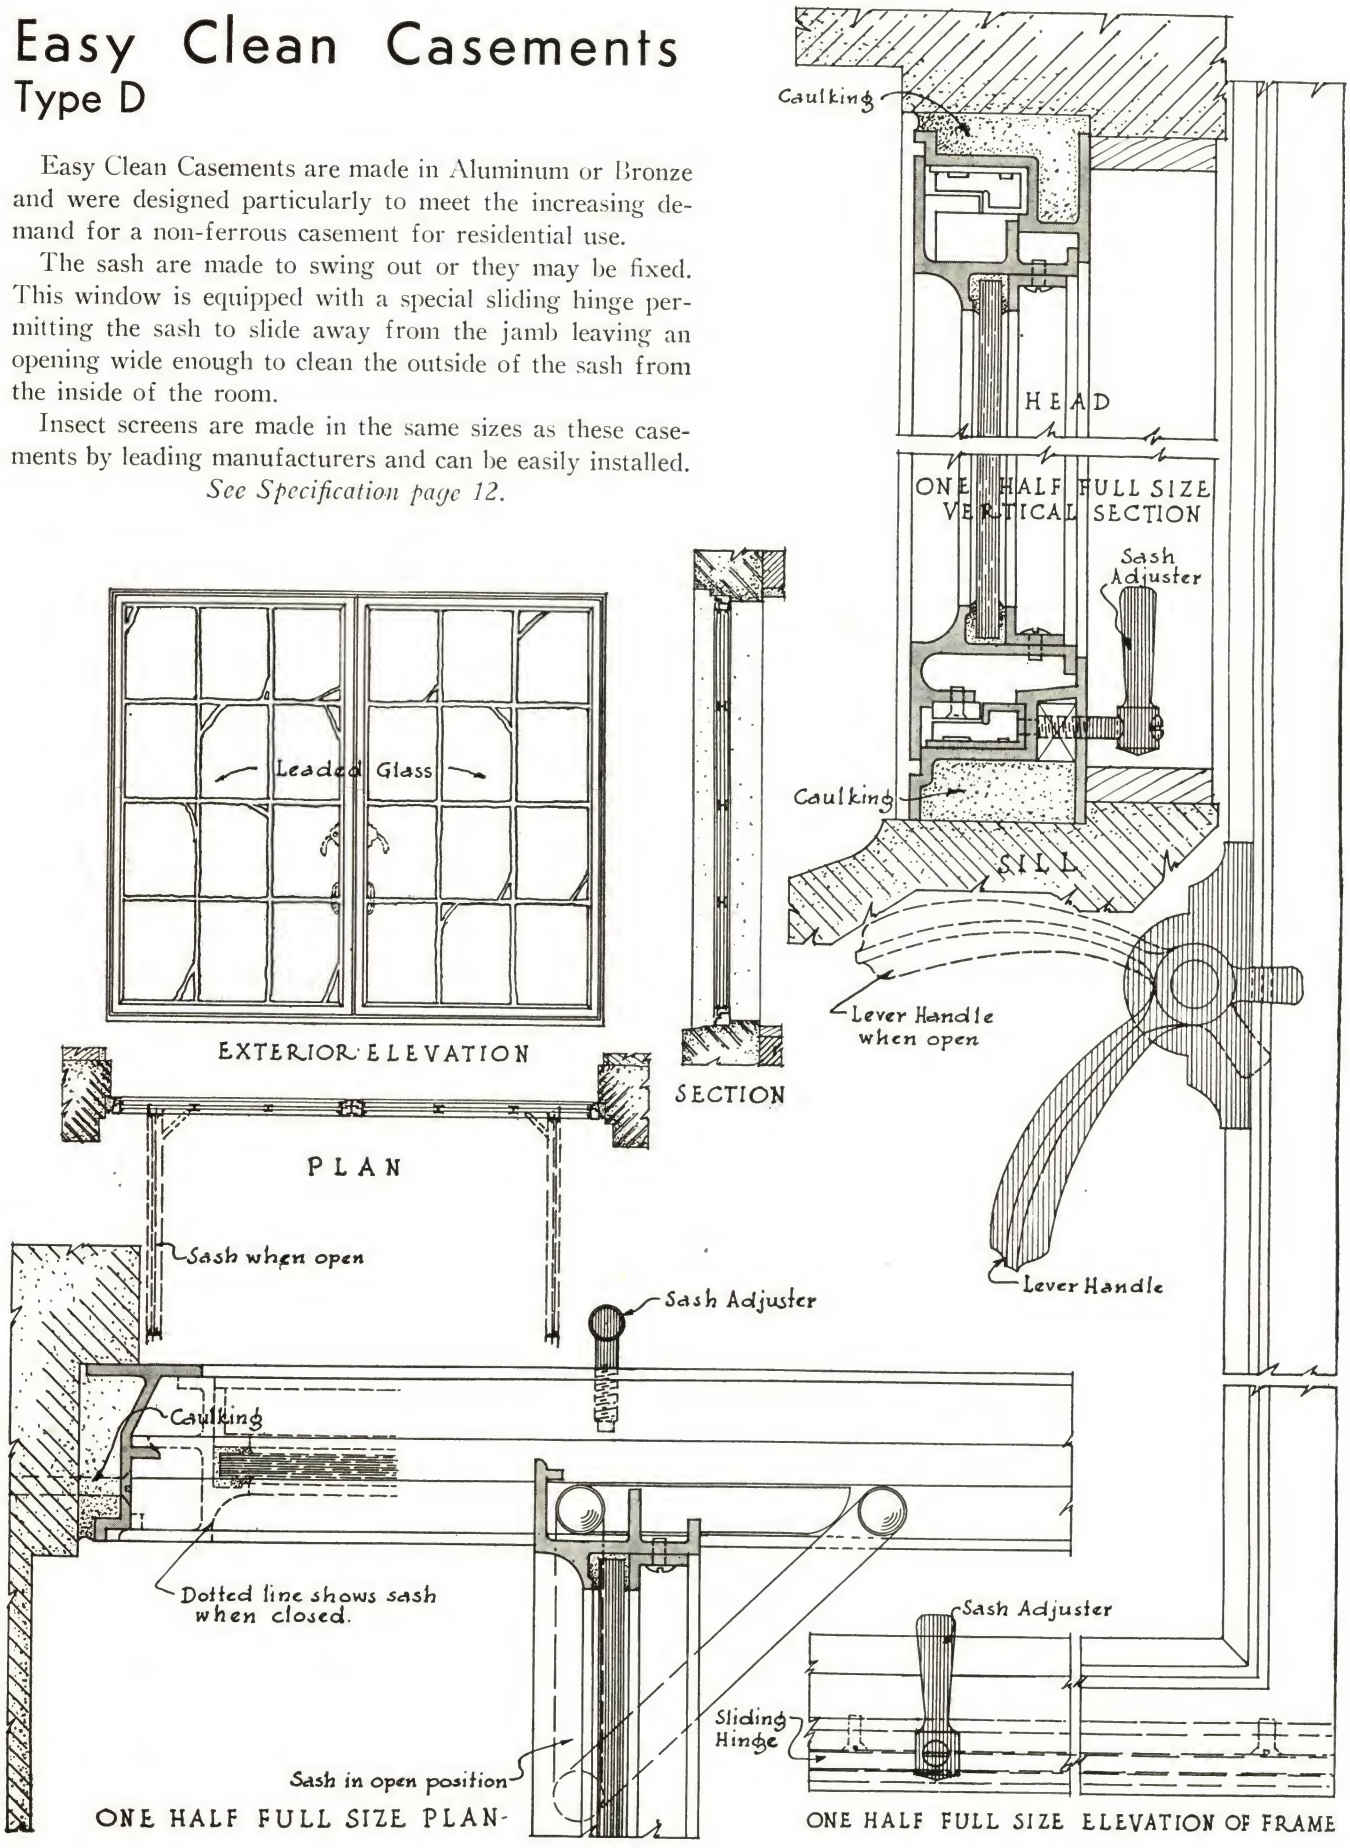
TYPE E-1



TYPE E-2

STANDARD CASEMENT WINDOWS—TYPES E-1 & E-2

FULL SIZE DETAILS



Easy Clean Casements
Type D

Easy Clean Casements are made in Aluminum or Bronze and were designed particularly to meet the increasing demand for a non-ferrous casement for residential use.

The sash are made to swing out or they may be fixed. This window is equipped with a special sliding hinge permitting the sash to slide away from the jamb leaving an opening wide enough to clean the outside of the sash from the inside of the room.

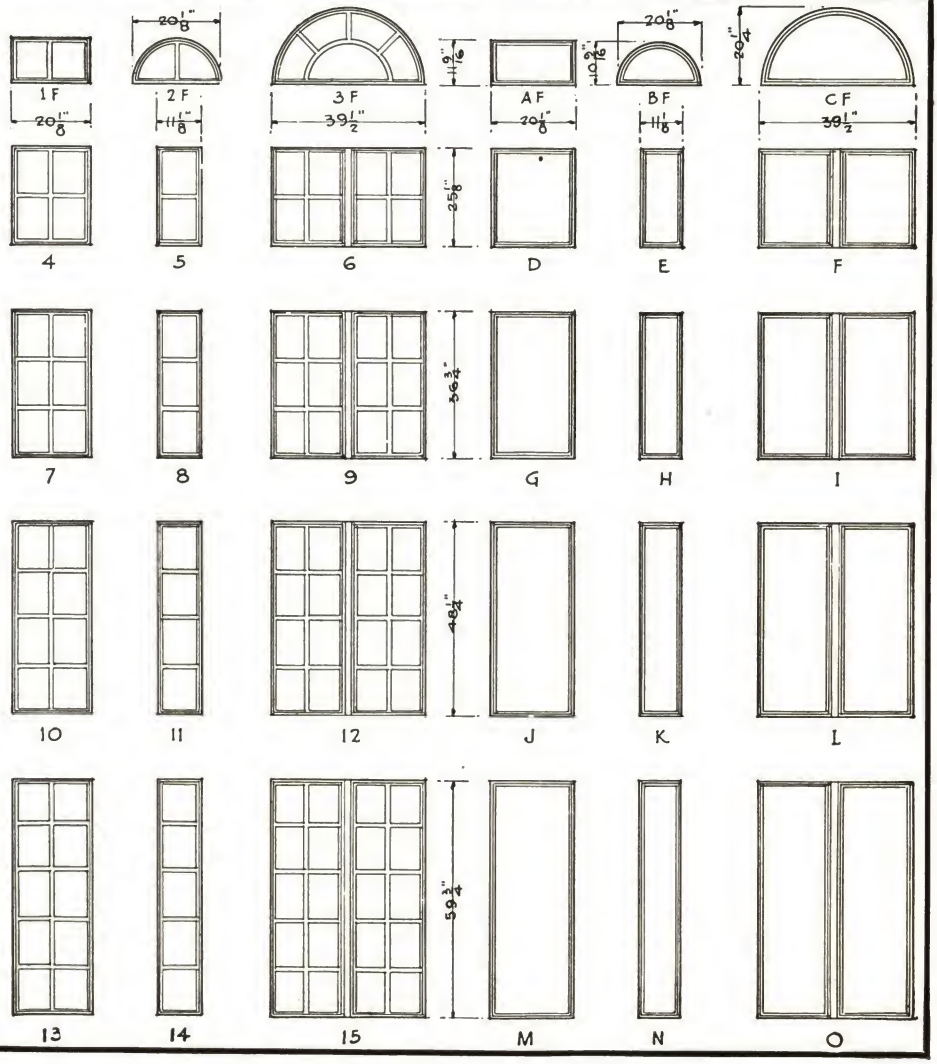
Insect screens are made in the same sizes as these casements by leading manufacturers and can be easily installed.

See Specification page 12.

Easy Clean Casements

Type D

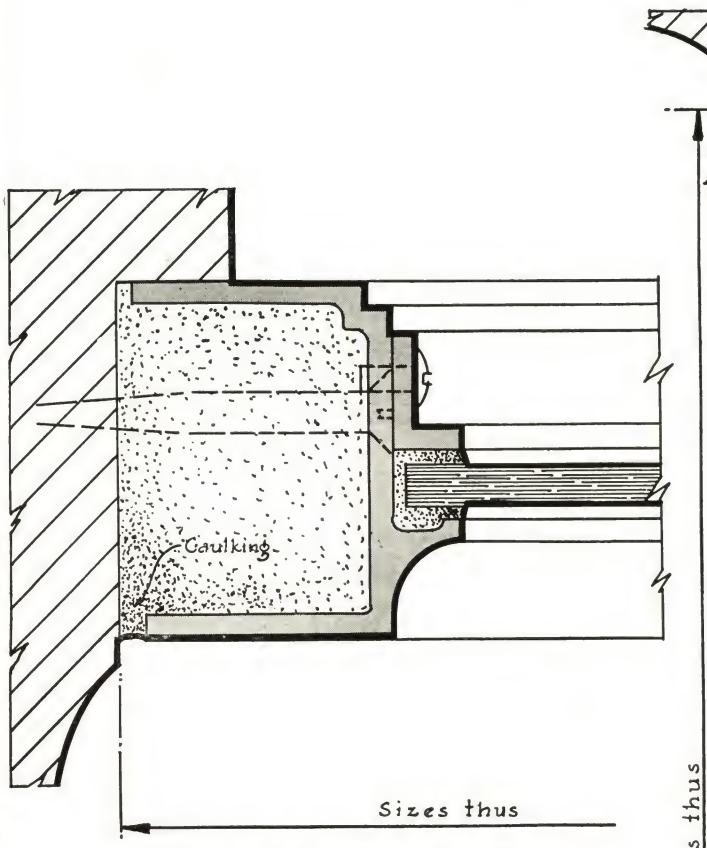
A. J. Eken Residence
Madison, N. J.



STANDARD TYPES AND SIZES

Mullions and transom bars of the same material as the sash can be furnished so that any of these units can be bolted together to make composite windows. To denote fixed sash add "F" after number or letter. To denote swing of casements add "R" or "L" after number or letter.

Right or Left swing determined thus—



The sizes indicated are the dimensions required to receive frames. The frames are made smaller for necessary clearance.

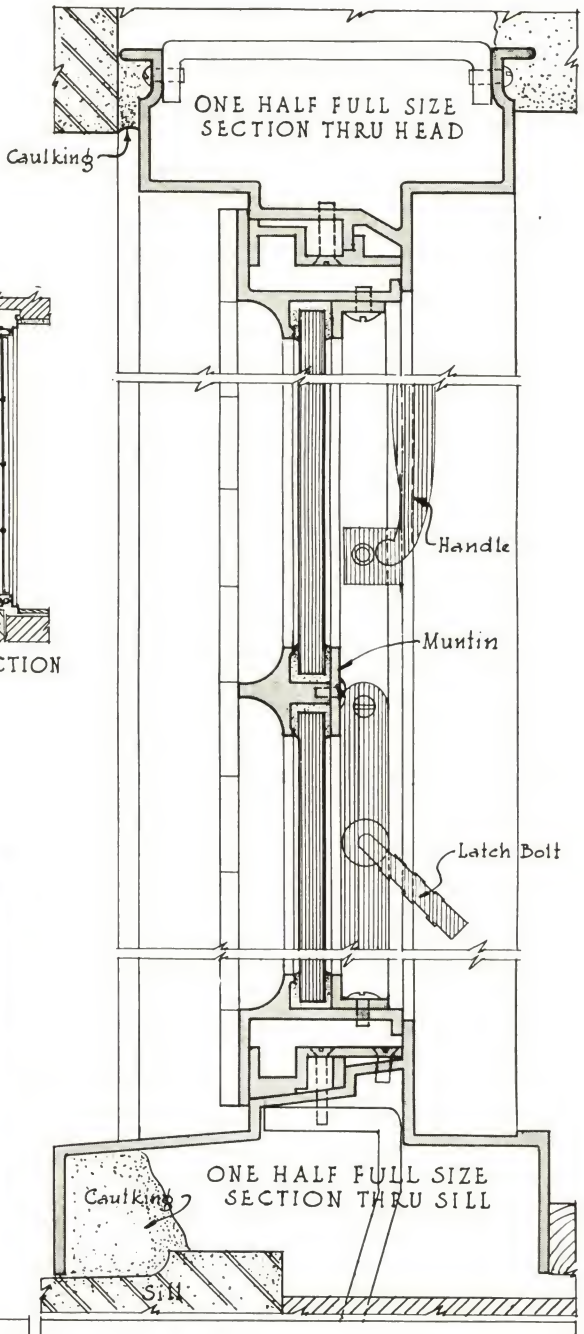
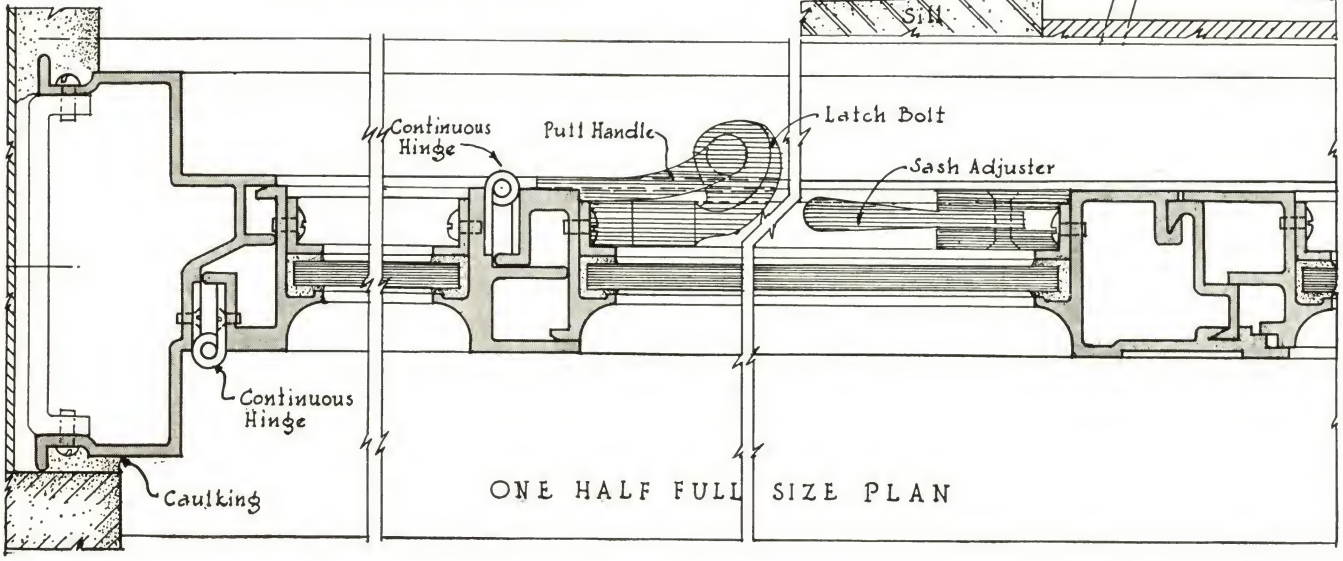
Clear Vision Casements

Type E-3

The sash of these windows when folded against the jambs give practically 100% ventilation and an unobstructed view as no mullions are required. They are particularly well adapted for Sun Porches, Dining Rooms and wherever the full enjoyment of the landscape is to be appreciated.



These windows can be furnished in either Bronze or Aluminum.



See Specification page 12.

WINDOW WITH ALL SASH OPEN SHOWING UNOBSTRUCTED VIEW

Specifications for Bronze or Aluminum Windows

(For Aluminum Windows substitute the word *Aluminum* for *Bronze*)

SHORT SPECIFICATION FOR ALL TYPES

All windows designated on drawings are to be manufactured by the WM. H. JACKSON COMPANY of types shown. They are to be made of extruded bronze not less than ⅛ in. thick. The operating sash shall work freely and all hardware is to be made of bronze. The windows are to be made air and water tight without the use of weatherstrips. After erection all dirt and stains are to be removed and windows left in a natural color.

Caulking, glass and glazing will be by others.

See note for Glazing below.

DETAILED SPECIFICATIONS

Double-Hung Type H-2

All Double-Hung windows designated on drawings are to be Type H-2 manufactured by the WM. H. JACKSON COMPANY.

The material shall be extruded bronze not less than ⅛ in. thick.

The weight pockets are to be of galvanized iron (22-gauge U. S. standard) and of ample sizes to enclose the sash weights. They are to be accurately fitted and securely fastened to the jambs.

Provide and install overhead pulleys with bronze fronts and cast iron or steel ball bearing wheels of sufficient diameter to insure the weight centering in the weight pockets.

Each sash is to be fitted with two sash chain hooks and provided with solid bronze sash chains, sash chains to have approved connecting links for the weights.

Weights for sash shall be of cast iron and adjustments are to be provided where necessary, so that each sash will be accurately balanced when glazed.

Sash shall be so constructed that the glass can be removed or replaced from the inside of the building. Provide necessary glazing angles.

The overhead pulleys, weights, chains, sash stops, etc., shall be so arranged that they can be taken out easily and replaced without removing the trim or the sash.

These windows shall have two continuous metallic contacts with sills, jambs, heads and meeting rails when closed, to insure them being air and water tight, without the use of weatherstrips.

Each window is to be provided with the following bronze hardware: two approved safety window cleaning bolts, one sash lift, one sash pull, one pole socket, one sash fastener, two bumpers, two sash binders and two shade brackets.

All windows are to be firmly anchored to the masonry and are to be thoroughly cleaned after erection, removing all dirt and stains and left in a natural color. Caulking, glass and glazing will be by others.

See note for Glazing below.

Double-Hung Type H-1 Fire Underwriters

These windows are made similar to Type H-2, use same specification adding—these windows are to have the approval of the National Board of Fire Underwriters and are to bear their labels.

Note: Fire Underwriters' windows Type H-1 are made only in bronze.

Casements Types E-1 and E-2

All Casements designated on drawings are to be Type (E-1 or E-2) manufactured by the WM. H. JACKSON COMPANY.

The material shall be extruded bronze, not less than ⅛ in. thick. The frame to be so designed that it forms an integral part of the outer Casement frame. Head, sill and transom bar to be similar in design and width.

The hinge side of the Casement shall be so designed that when closed it shall form a perfect interlocking three-point contact with the outer frame, and shall be hung on continuous bronze hinges. The head, sill and strike jambs shall be so designed as to make a perfect three-point contact with the outer frame when closed.

The Casements are to be side hinged to swing [out] [in], transom sash where called for are to be bottom hinged to swing in [top hinged to swing out]. The sash shall be so constructed that the glass can be removed or replaced from the inside of the building, and fitted with glazing angles.

Sash are to be fitted with solid bronze cremone bolts, friction adjusters and spring catches for pole operation on transom sash.

The Casements are to be air and water tight, without the use of weatherstrips.

All windows to be firmly anchored to the masonry and to be cleaned after erection, removing dirt and stains and left in a natural color. Caulking, glass and glazing will be by others.

See note for Glazing below.

Easy Clean—Type D

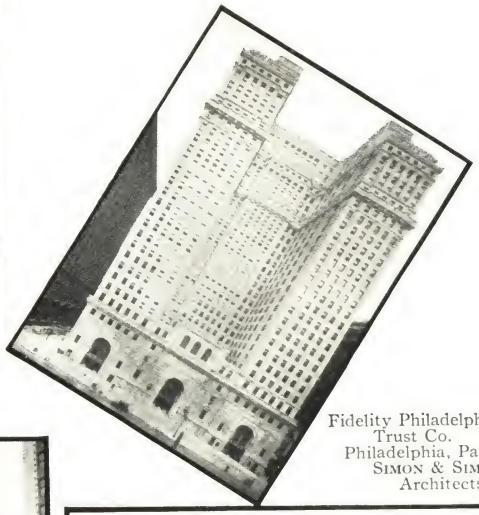
All windows designated on drawings are to be manufactured by the WM. H. JACKSON COMPANY their Type D. (see page 10 for various conditions and describe fully.) Frames and sash are to be made of extruded bronze not less than ⅛ in. thick. Sash indicated are to swing out and are to be provided with special sliding hinges permitting the sash to slide away from the jamb leaving an opening to clean the outside of the sash from the inside of the room. They are also to be provided with bronze casement fasteners and concealed adjusters. All operating sash shall have three points of contact and are to be made air and water tight without the use of weatherstrips. The fixed sash are to be of channel shaped section of the same profile as the operating sash.

Clear Vision—Type E-3

Copy Specifications for Types E-1 and E-2 omitting the fourth and fifth paragraphs and substituting the following:

The sash are to be connected with continuous hinges and are to be joined together in pairs or quadruples. All sash, except the one directly connected with the jamb, are to be provided with guides allowing the sash to slide and fold together against the hinge jamb in accordion fashion. They are to be fitted with pull handles, spring catches and adjusters suitable to properly lock and control the operation (as detailed on page 11).

GLAZING



We recommend glazing with Vulcatex Glazing Compound No. 202 as made to specification of WM. H. JACKSON COMPANY and as manufactured by A. C. Horn Company, L. I. City, N. Y.

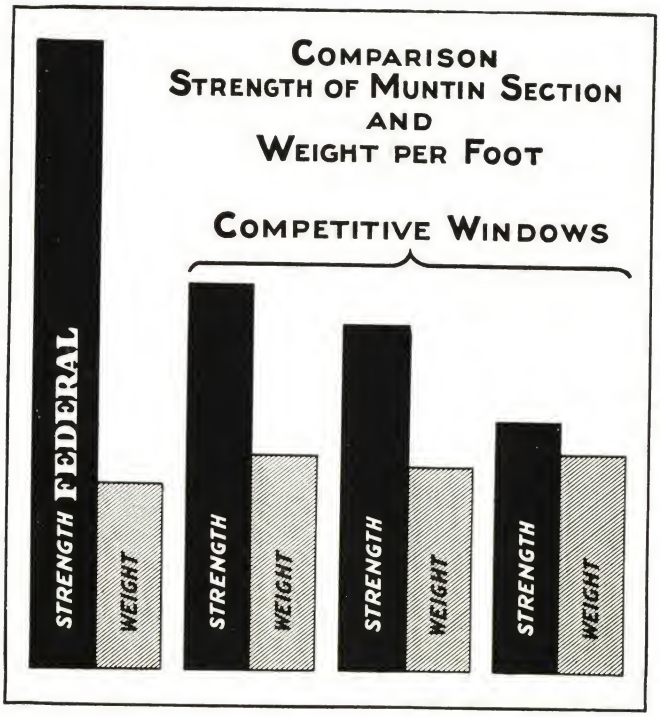
OUTSTANDING FEDERAL FEATURES

Electric Arc Welded Construction

When steel windows were first introduced, the designers were faced with the problem of making a joint between the various members, similar to the joints in wood sash, which could be economically produced with the facilities then available. Some form of interlocked, mitered, dovetailed or tongue and slot joint was used, in which it was necessary to cut away a portion of the section of each of the members to be joined. As a result, the actual or effective depth of the mechanically jointed section was less at the joint by the amount of the cutout than the overall depth, and as the strength at the weakest point had to be sufficient to withstand the stresses to which the window would be subjected, the members as designed were of necessity heavier between the joints than was required, with the result that extra weight was added to the member without adding anything to the strength or stiffness of the window. This is the old proposition of the chain and its weak link. *Just as no chain is stronger than its weakest link, no window member is stronger than its weakest point.*

The Weld Produces a Joint as Strong as the Section
Note failure of the section, the weld being intact

In addition to the disadvantage of having to increase the weight of the members without any compensating increase in strength or stiffness, there was a further pronounced disadvantage inherent in interlocked, mitered, dovetailed or tongue and slot joints, namely, that after the window was assembled it would rack out of shape in handling, shipping and erecting. This instability of construction arose from the fact that the only way in which these joints could be held in place was by hammering or pressing the members together.



The inability to make a rigid mechanical joint not only increases the difficulty and cost of erection, but what is more important—makes difficult a properly weathered and easily operating ventilator.

It was not until the development of *electric arc welding* as a manufacturing process that a method of making connections was available which would eliminate the excess weight and the instability inherent in mechanically formed joints. The use of the electric arc is today so general in industry and construction as to require no argument to prove its practicability.

Federal engineers, in designing Federal Electric Arc Welded Products, were enabled to take advantage of this most modern method of joining materials and to design *a window with sections and joints in which the gross section of the member is utilized to the full for strength and stiffness, in which all excess weight is eliminated and in which every joint and connection is absolutely rigid and stable,* a window which it is not possible to rack or distort in handling, shipping and erection.

There is in the minds of some the impression that because something is heavy it must be inherently strong. This impression is, of course, to anyone acquainted with engineering principles, absurd, as it is well recognized that *mere weight does not in itself mean strength,* but that it is the proper distribution of the metal in the section and the proper design of the section itself for the purpose for which it is intended that are the essential factors. It is evident that any metal used in excess of that required to produce the given result can add no useful strength and is to all intents and purposes merely excess weight.

In order to visualize the relation between the weight per foot and the strength of the muntin section used in horizontally pivoted windows as determined by the condition at the joint after fabrication, the chart shown herewith has been prepared. *It will be evident from an examination of this chart that the Federal Muntin section, while the lightest section in weight per foot, is also the strongest.* A study of this chart together with an examination of the types of construction used on competitive windows will demonstrate that Federal engineers have been able to utilize material to its full value, and why the claim of superiority of design and construction for Federal products over the design and construction of any competitive window is well founded.

Materials

All sections are open hearth solid steel, hot rolled or cold drawn, of special Federal design.

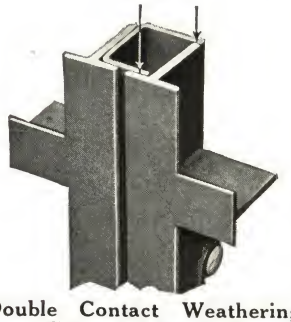
Distorted Joint, Showing the Remarkable Strength of the Weld

The Muntin Joint
Note the Smooth Exterior Surface

Federal Manufacturing Methods

The raw material is cut to length and the ends formed for the welded connection in one operation. Where members are built up of two or more sections they are *electric spot welded* together while firmly held in jigs to assure accurate dimensions of the built-up members. Preparatory to electric arc welding the joints, the individual members are assembled on welding tables. These tables consist of rigid heavy structural steel frames with accurately machined surfaces. On these frames are bolted the welding pads with their clamps and guides. The individual members are clamped in the guides with their exterior faces against the welding pads and while thus firmly held in position each connection is *electric arc welded.* This method insures absolute squareness and accuracy of dimension and a product which is to all intent and purpose one solid piece. The design of the welding tables, and the method of assembling and welding on the tables, are protected by United States patents Nos. 1648409 and 1648416.

A comparison of methods used in manufacturing Federal Windows with those used in the manufacture of competitive windows will show several points of superiority in the Federal method. *There are no cutouts or notches in any Federal members* to permit of the joining together of two members at the joint, and *there is no distortion, spreading or stretching of the material in Federal construction,* as is the case in a number of other makes of windows. The use of the electric arc for forming connections fills up all spaces between members and leaves *a smooth, unbroken surface at the Federal connection* as compared to the overlapped surface or butted edges common to connections in competitive windows.



After welding, the products are removed from the welding table and the face of each weld is ground to a smooth surface. All excess material and roughness at the welds on the interior is removed by chipping with an air hammer. This operation not only cleans each weld, but subjects each individual weld to a severe shock test, so that in this operation *every weld made on Federal products is individually tested for strength.*

Ventilators are then fitted and hardware attached, after which the product is again inspected, is painted and is then ready for shipment.

Double Contact Weathering of Window Ventilators

Federal window ventilators are constructed to provide *continuous double contact weathering* around all four sides of the ventilators. All ventilators are accurately fitted at the shop, and since Federal windows are rigid and cannot be distorted in handling, shipment or erection, the window when erected will be in a satisfactory weathering condition. The shop fitting of Federal horizontally pivoted ventilators, combined with the Federal close pivot construction and the lever action of Federal draw-tight ventilator operators, produces a pivoted window which is both rain and wind tight.

Tests which have been made by reputable engineers in a careful and scientific manner to determine the leakage through ventilators on horizontally pivoted steel windows, demonstrate the superiority of Federal construction over that used in competitive windows. Comparing the results of tests on five other windows to the result on Federal, the nearest competitive window had a leakage of 39.5% in excess of Federal, while the maximum leakage was 143.0% of Federal, and the average for the five windows was 105.8% in excess of Federal, or over twice the leakage through the Federal ventilator.

Double Contact Weathering All Four Sides of the Ventilators

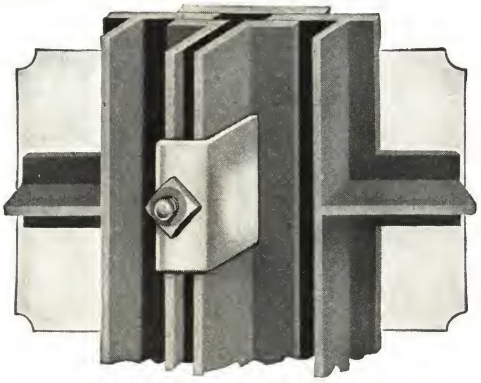
No Corrosion of Joints

There are no overlapped surfaces or butt contacts on Federal steel windows, and consequently there are no points at which moisture can enter and set up corrosion. The flush exterior surface of Federal windows, free from all projections and ledges, avoids the collection of dirt and moisture. *There are no open joints.* All surfaces are accessible for painting.

Rust Prevention

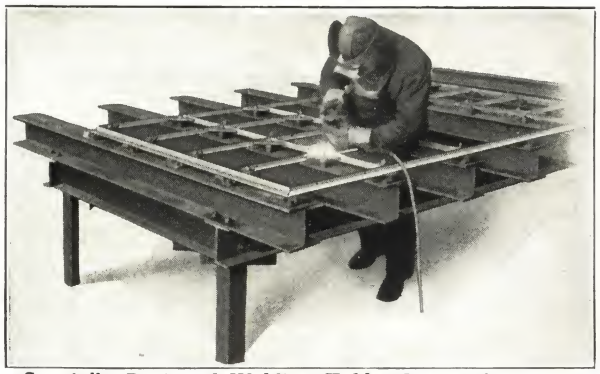
As Federal windows are absolutely rigid and there are no open, overlapped or butt joints, and all surfaces are smooth and accessible, it is possible to *hot dip galvanize* Federal windows or to *plate with any protective metal covering* with the assurance that the protective covering will not be injured due to movement between the window members while being handled, shipped or erected.

Federal Close Pivot



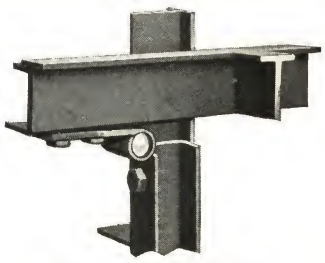
The Federal pivot for horizontally pivoted windows projects but ⅝ in. from the window frame. *It consists of two substantial pressed steel leaves joined with a sturdy bronze pin.* The use of a bronze pin prevents rusting and insures at all times a free acting ventilator. The very small projection of this pivot materially lessens the chance of injury during shipment, handling and erecting.

Federal Draw-Tight Push Bars



The horizontally pivoted ventilator push bar is attached to the bottom of the ventilator at one side of the center with a *heavy pressed metal hinge,* which gives a universal joint to the bar. When the ventilator is closed the push bar folds back, parallel to the face of the window, against a strike plate which is bolted to the fixed portion of the window at the center. At the side of the ventilator opposite the hinge is a locking clip bolted to the ventilator. The hinge, strike plate and locking clip are so located that when the push bar is in its locking position, the bar presses against the center strike plate, thus drawing the ventilator into tight weathering contact and at the same time locking it against opening.

Federal Commercial and Architectural Projected Window Bronze Friction Guides



As the smooth operation of projected ventilators depends upon the friction guide, the proper design of this feature is of importance. The Federal bronze friction guide is designed to eliminate the scraping action of the ordinary bronze shoe used on competitive windows. A guide angle is provided on each jamb of the ventilator opening, which serves to hold the ventilator in its proper location at any degree of opening. *A bronze yoke, which has a hardened steel ball,* slides on this guide angle. The friction which holds the ventilator in any desired position is obtained by the pressure of a spring in the friction guide forcing the steel ball against the edge of the guide angle. In this way rubbing or scraping of the friction guide against the sides of the ventilator opening is eliminated and a smooth and positive acting ventilator adjustment is obtained.

A VERSATILE WINDOW CONSTRUCTION

In-Swinging, Out-Swinging, or a Combination of Both

THE KAWNEER COMPANY, Niles, Michigan, manufactures a versatile window construction in which each sash can be hinged at top, bottom or sides to swing either in or out. Ventilation is easily controlled in this type of window. It affords continuous *three-point contact weathering,* with two contacts resilient and the other positive. This construction is guaranteed *weatherproof, dustproof* and *rattleproof.* The Sealair Window combines modern lines, unblemished by rivets and bolts. Furnished in extruded bronze or aluminum alloy, all joints strongly welded. *The exterior can be washed from inside.*

Sectional details will be found in complete Kawneer catalogue (see Manufacturers' Index).

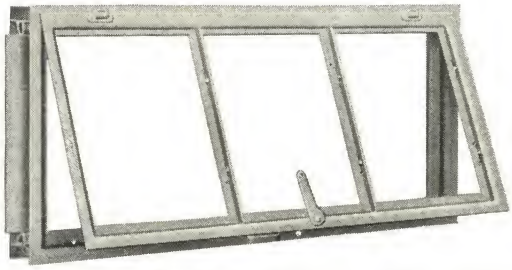
KEWANEE MANUFACTURING COMPANY

Steel Windows and Other Building Products

1600 Burlington Avenue, KEWANEE, ILL.

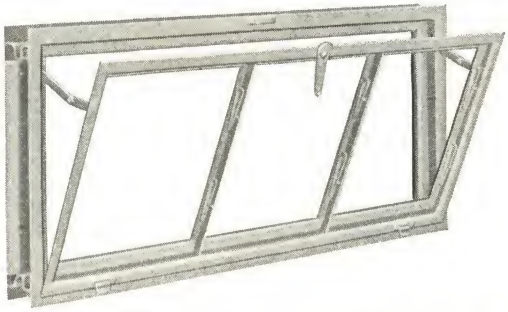
NATIONALLY DISTRIBUTED THROUGH DEALERS IN BUILDING MATERIAL

Products



KEWANEE COPPER STEEL BASEMENT WINDOWS; KEWANEE STEEL UTILITY WINDOWS.

Also Fireplace Dampers, Ash Dumps, Clean-out Doors, Package Receivers, Built-in Mail Chutes, Basement Columns, and other Building Products



For Kewanee Copper Steel Basement Coal Chutes, see Manufacturers' Index.

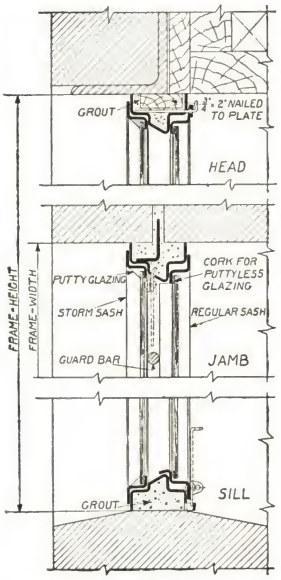
Kewanee Basement Window (Patented)

The Kewanee Basement Window fulfills the requirements of the modern home. Box frame all-steel construction precludes warping, shrinking, swelling, slivering, and rotting. Its attractive, sturdy design embodies the spirit of modern architecture, permitting maximum daylight to reach the basement and combining convenience, protection and adaptability.

Kewanee Bottom Ventilating Window—This window operates in the usual way, sash hinging at top and swinging open at bottom. All parts are of heavy rust-resistant copper steel, electric welded at every joint. Action of hook hinges at top and cam action lock at bottom is to draw the die-pressed sash and frame together into a true, double weathering contact all around.

Kewanee Top Ventilating Window—It is the top hung window in inverted position, except for overhanging drip bar being built into hinge side instead of latch side of sash, and the two jointed arms, one on each side of sash, which are added for limiting the opening of sash. By lifting ends of jointed arms out of slots in window frame in which they engage, sash can be swung down into horizontal position and detached from frame.

KEWANEE BASEMENT WINDOWS



Lights		Wall opening required, in.*		Shipping weight, lb.	Size Nos.			
					Bottom ventilating		Top ventilating

*Over-all dimensions same as "Wall Opening Required," except for anchor fins which project on each side ¾ in. into wall.

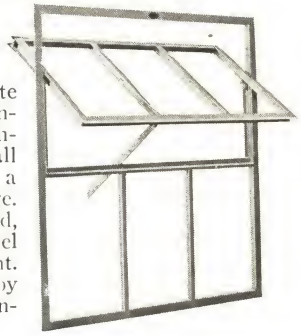
Kewanee Screen or Kewanee Storm Sash—Attaches on the inside by means of cam action latches which engage in slots in the window frame. The frame design permits guard bars to be welded in place without interfering with screen or storm sash.

Construction Details—Diagram shows exact shape of different members, and efficient way in which regular sash, storm sash (or screen) and guard bars are accommodated within frame. Note double contact of storm and regular sash.

Box frame stands upright of itself while being set. Anchor fins, one on either side of frame, extend ¾ in. into jamb, and hold frame securely in place. Space within the channel-like section of frame forms a pocket for mortar which seals frame tightly to wall.

Putty or Puttyless Glazing—Double glazing clip is sprung under a lug in side of sash to hold pane of glass in place against bed putty while face putty is being applied. Four or six clips supplied for each pane of glass.

For glazing without use of putty, strips of composition cork are cemented to bearing surfaces of sash and glass is pressed against this cork cushion by means of an adjustable retaining wedge—four or six for each pane—which catches under lug.



Kewanee Steel Utility Window

Designed to give real service in garages, filling stations, stores, factories, warehouses, barns, etc. Provides economy in installation, maximum daylight and ventilation, convenient operation, and protection against deterioration, fire and theft.

Three lower lights are stationary and three upper lights form horizontally pivoted ventilator which closes all around in a tight, weatherproof *double contact*. Pushbar holds ventilator at any angle, also locks it when closed.

Supplied either with clips (for glazing with putty) or with cork lining and retaining wedges (for glazing without putty).

Will fit perfectly in concrete block, brick, frame or other construction. Projecting flange of window frame embeds ½ in. on all sides into building wall, forming a windproof, weathertight anchorage. Exceptionally strong and rugged, being made of heavy rolled steel sections, arc-welded at each joint. Can be used singly or combined, by means of mullions, for larger openings.

Member Solid Section Steel Window Industry

Products

HEAVY STEEL CASEMENTS of all types and sizes. STEEL SPECIAL SASH; STEEL SPECIAL FRENCH DOORS; STEEL FACTORY SASH; STEEL PROJECTED SASH; STEEL DOUBLE HUNG WINDOWS.

General

The outstanding principles uppermost in the minds of the designers and manufacturers of "Lea" products are beauty, simplicity, strength, practicability and economy.

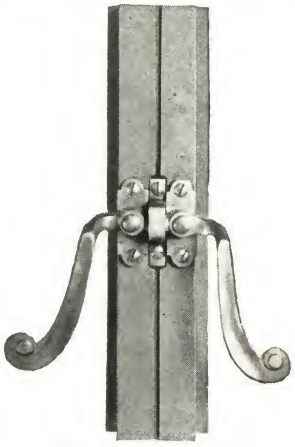
The accomplishment of these principles has been the contributing factor for their widespread and determined selection.

The ultimate satisfaction "Lea" products are rendering in utility, durability and convenience, elevates them to a high position in the minds of the leading architects and builders. This is especially so of our heavy steel casements, thereby placing them in a commanding position in the steel casement manufacturing industry.

"Lea" Steel Casements are now being used in the largest and finest buildings of the West and bear recognition.

The complete line of types and sizes we are in a position to furnish is not included in this catalogue. The heavy weight and structural strength of our sections enables us to build casements to meet every requirement.

We have furnished and installed many large as well as small installations of special sash and are in a position to fill your special requirements.



Advisory Service

Our Service Department is prepared to give full information and to offer suggestions regarding problems to meet individual requirements. Architects and builders are invited to avail themselves of our facilities and service. Your inquiries will receive prompt attention.

Specifications for "Lea" Steel Casements

General—Where steel casements are shown they shall be "Lea" Steel Casements as manufactured by W. C. Lea, Los Angeles, California.

Scope of Work—The Steel Casement Contractor shall include in his work the furnishing and installing of all steel casements complete, adjusting of casements after erection and attaching of hardware after glazing and painting have been finished.

Work Not Included in Steel Casement Contract—Window cleaner bolts or belts, the filling of sills with concrete, glass or glazing or putty, metal stools, bronze sills or thresholds, metal trim or plaster mould, grounds, screens, painting (except standard shop coat of gray metallic paint), grouting, calking or pointing, any expense for use of telephone, light, power or equipment of owner or general contractor.

Material—Sections used in the manufacture of these casements shall be copper bearing hot rolled steel sections containing not less than 0.15% nor more than 0.30% copper, and shall be of size and special shapes as shown in the 1932 Edition of Sweet's Architectural Catalogues. Weight of sections shall be not less than 1.67 lb. per ft. for the outside frame, 1.45 lb. per ft. for the swing leaf frame and .89 lb. per ft. for muntin bars.

Construction—All corners of frame and swing leaves shall be mitred, electrically butt-welded and ground smooth. All transom bars and meeting rails shall be riveted to the adjoining section and the inside face of joint shall be electrically welded and ground smooth. Where muntins occur, they shall be riveted to the adjoining section and the inside face of joint shall be electrically welded and ground smooth. Cross joint of muntin bars shall be "Lea" dovetailed and interlocked intersections.

Weathering—Continuous contact weathering shall be provided. Head section (for outswing casements) where swing leaf comes to top of sash and transom bar shall have a continuous drip which shall be an integral part of the section.

Hardware—Unless otherwise specifically mentioned, hardware shall consist of the following: Heavy steel angle extension (cleaning) hinges with bronze pins, standard steel latch plate, solid bronze latch lever and wedge strike and concealed friction adjuster. (Inswing casements shall have hardware as shown in the 1932 Edition of Sweet's Architectural Catalogues.)

Painting—Casements shall receive one dip coat of "Lea" special gray metallic paint before shipping.

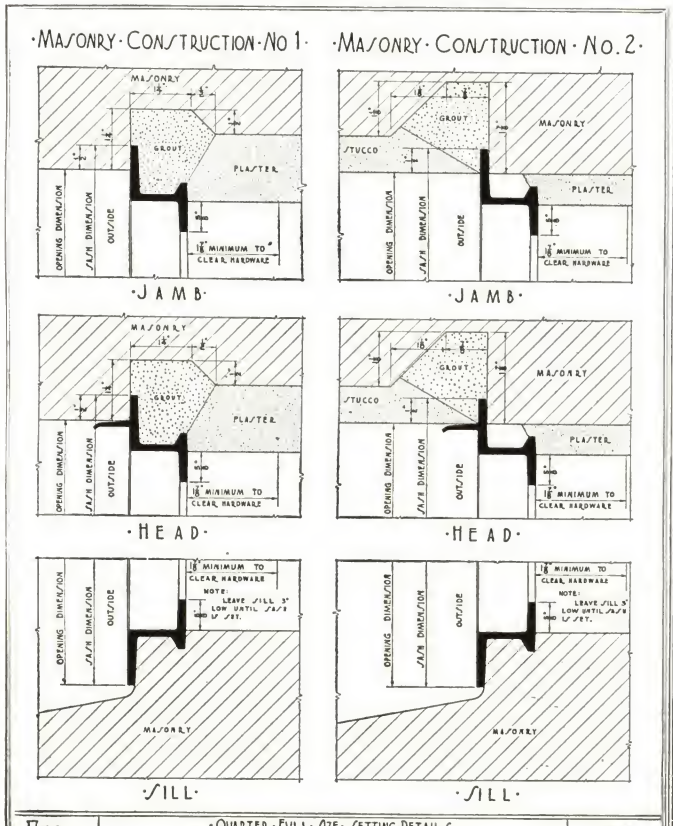
Erection—General contractor shall build openings for steel casements according to details and dimensions shown on Steel Casement Contractor's drawing as approved by the architect.

Steel Casement Contractor shall set casements into wall, adjust after erection and before glazing, and attach hardware after glazing and painting have been finished as called for on drawings and covered in these specifications. Mastic shall be applied by Steel Casement Contractor as shown on approved drawings.

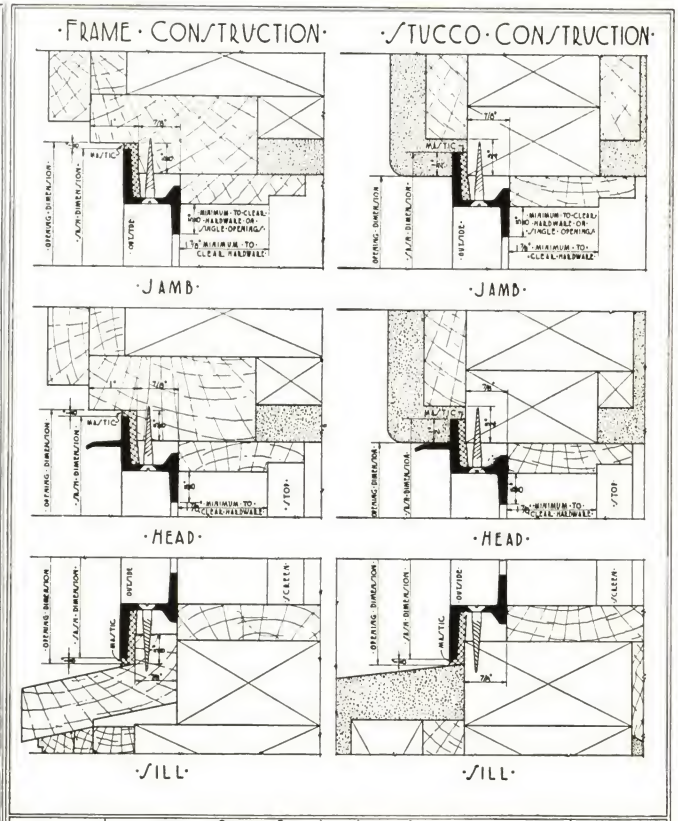
Glazing—All casements shall be glazed as shown on approved details. Unless otherwise shown, glass shall be held in place by "Lea" coppered spring steel wire glazing clips and shall be bedded and face puttied with "Lea" metal window putty. Where glazing beads are shown, corners shall be mitred, electrically butt-welded and ground smooth, they shall be fastened to sash with countersunk oval head brass screws.

Hoisting—General contractor shall do all hoisting of materials for Steel Casement Contractor from the street level to the floors on which the material is to be used. Steel Casement Contractor shall do all necessary distributing of the sash on the floors. Such hoisting shall be without cost to Steel Casement Contractor.

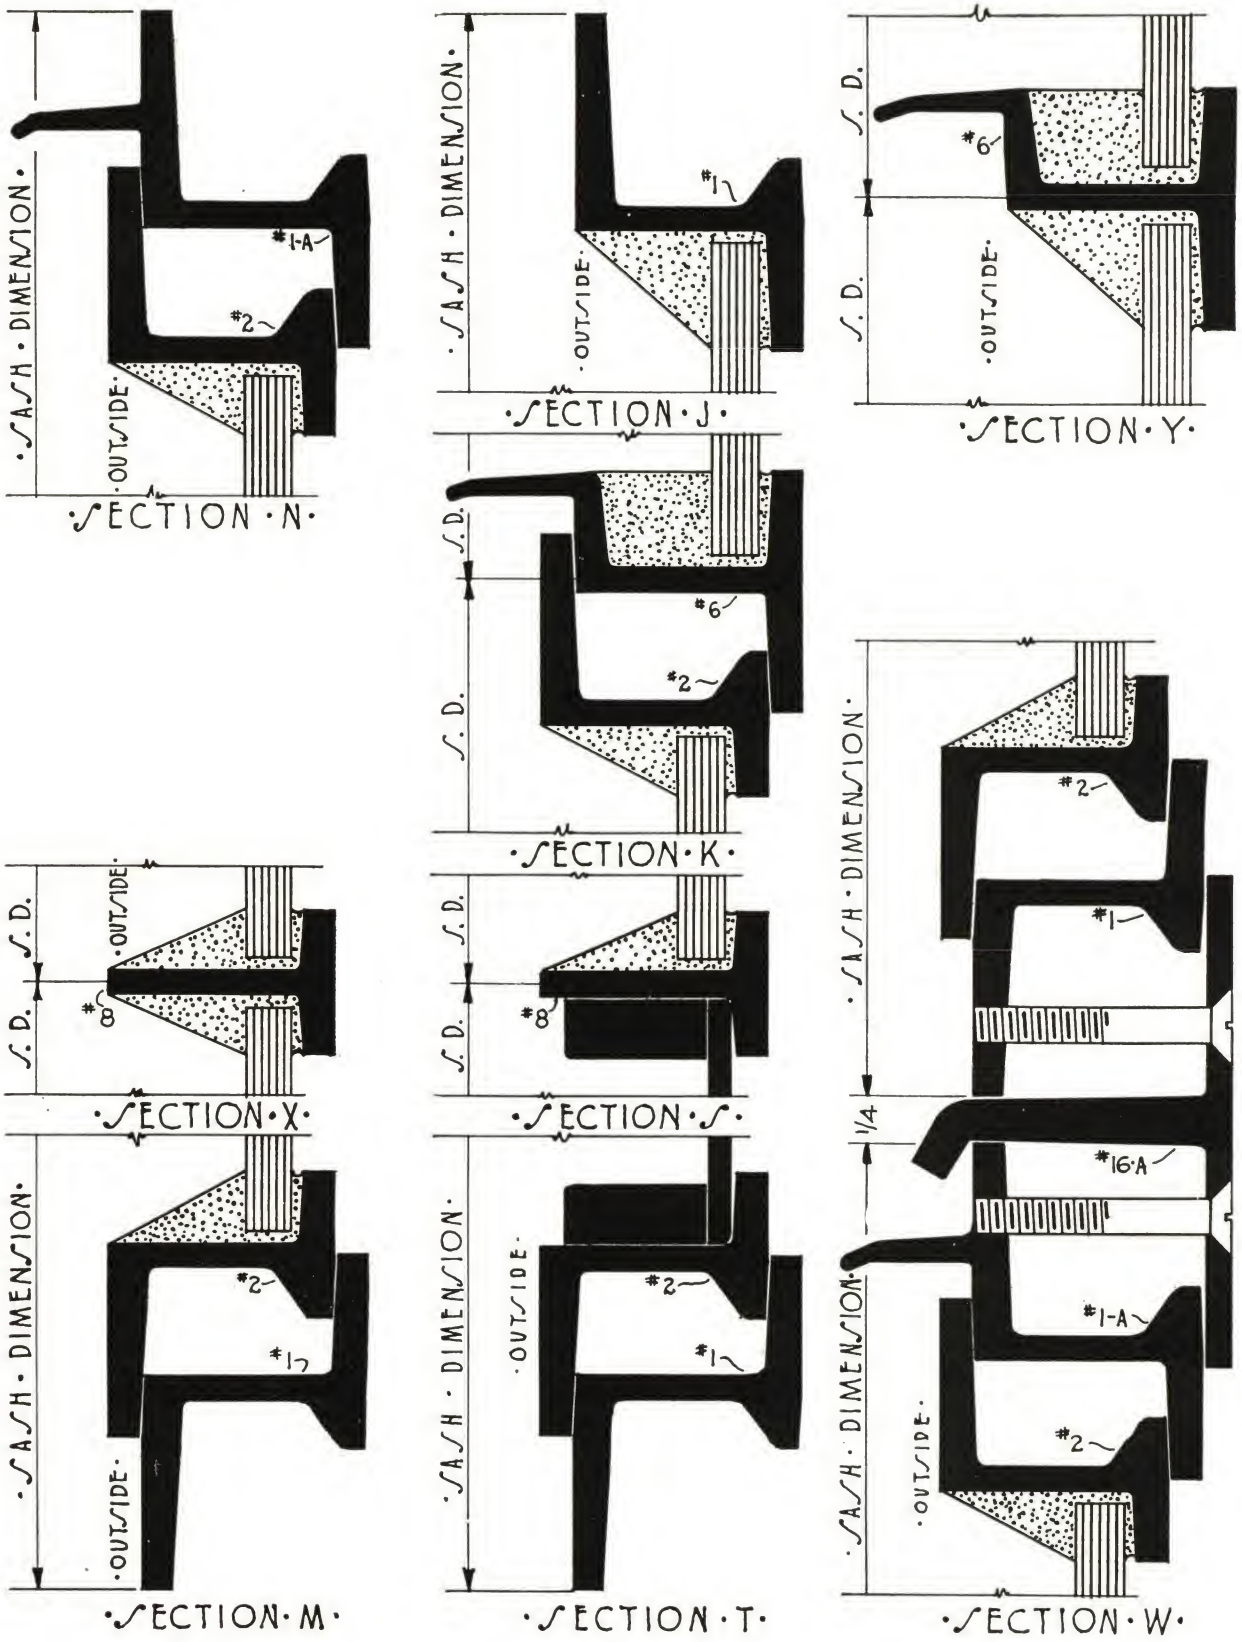
Instructions for Setting



When sash are delivered to job they should be stacked on end so that they will not be sprung by their aggregate weight.



Openings for "Lea" Steel Casements should be built as detailed below. Care should be taken in the construction of these openings that they be plumb and square, and that clearance called for on details is provided. The dimensions given for units shown on W. C. Lea shop drawing are sash dimensions. If openings are properly built the sash will slip easily into place. *Mastic should be substantially applied to casements before they are permanently screwed or grouted into place. This will insure a watertight joint between them and collateral construction.



It is necessary for perfect operation of swing leaves that casements be set plumb and square into openings. The frame should not be crowded nor used to carry other construction. The swing leaves should be tested and adjusted if necessary just before windows are glazed. Finish hardware is usually applied after the glazing and finish painting have been completed.

If the building construction is other than that shown here, we shall be pleased to submit other details for your approval.

*Note: Sufficient mastic is furnished without additional cost (1 lb. to 10 lineal ft.); additional mastic may be secured at additional cost.

Specifications for "Lea" Steel Double Hung Windows

General—All exterior steel double hung windows shall be "Lea" Steel Double Hung Windows as manufactured by W. C. LEA, Los Angeles, Calif.

Work Not Included in Steel Double Hung Window Contract—Setting of frames, filling of sills with concrete, grouting, calking, pointing and hoisting, glass, glazing, putty, (metal stools), metal trim or plaster mould, grounds, screens or painting (except standard shop coat of paint).

Material—Frame members to be constructed with the following gauges of galvanized steel:

Weight box	No. 16 gauge
Weight box covers	No. 14 gauge
Head jamb	No. 16 gauge
Sill	No. 12 gauge
Weight division	No. 24 gauge

Special "Lea" Weatherstrip (bronze).

Sash members to be constructed of hot rolled copper bearing solid steel sections, containing not less than 0.15% nor more than 0.30% of copper.

Minimum weight per lineal foot of sash members to be as follows:

Top rail and sides	1.45 lb.
Top check rail	1.95 lb.
Bottom check rail	2.08 lb.
Bottom rail	1.95 lb.

Glazing angles to be $\frac{7}{16} \times \frac{3}{4} \times \frac{3}{32}$ in.

Construction—Joints between weight boxes, head jambs and sills to be welded and ground smooth, weight box covers to be fastened to weight box by means of especially formed clamps and screws.

Dimensions of frame shall not be more than 5¾ in. from outside to inside. Weight box shall be so formed as to provide a continuous anchor behind grout.

All double hung frames shall be equipped with (bronze) guides, which form a weatherstrip, so that sash will slide against same instead of sliding against steel portion of frame. Head jamb, sill (and transom bar where required) to be equipped with (bronze) weatherstrips.

Corners of sash shall be mitred, electrically butt-welded and ground smooth. Sash sections are to be punched and tapped for the attachment of all finish hardware.

Hardware—All hardware to be "Lea" standard hardware. Frames are to be equipped with special removable pulleys with $\frac{7}{8}$-in. diameter steel pins. Sash are to be hung with heavy (red metal) galvanized steel chain No. A or equal. Sash are to be properly balanced with one-piece cast iron weights $1\frac{1}{16} \times 3\frac{1}{4}$ in. in section.

Frames are to be equipped with "Lea" No. 125 window cleaner bolts and reinforcements.

All finish hardware shall be solid bronze finished to match other hardware in the building. Such hardware to consist of two bar lifts for lower sash, one bar pull for upper sash, and sash lock.

Where transoms occur they shall be reversible type to open in at top with concealed reversible hardware and concealed transom catch at top with solid bronze control on inside face of transom. Finish hardware and weights are to be shipped separately to be attached at the building.

Paint—Before shipment, windows are to be thoroughly cleaned and given one shop coat of "Lea" gray metallic paint.

Installation—General contractor will fill sills of window frames with concrete and will set or build the window frames in the wall perfectly true, straight, square and plumb and do all necessary grouting, calking and pointing. After frames are set, steel double hung window contractor will install all sash weights and, when glazing is done by others, will properly balance sash and weights. After painting is done by others, steel double hung window contractor will apply all "Lea" standard finish hardware and properly adjust all sash, leaving them in a first class working condition.

Hoisting—General contractor will do all hoisting of materials, for steel double hung window contractor, from the street level to the floors on which the material is to be used, steel double hung window contractor to do all necessary distributing of the sash and hardware on the floors. Such hoisting shall be without cost to steel double hung window contractor.

Wrought Iron

It has been our pleasure to originate and develop solid section metal window sash made from genuine wrought iron.

This material, due to its inherent ability to resist progressive corrosion, coupled with its new improved heavy duty construction, has found an immediate acceptance wherever quality products and low maintenance costs are wanted.

This metal is made to A.S.T.M. Specification A-84-30 Grade C, and where required, should be specified as such to eliminate the possibility of less corrosive resistant substitutes.

All our wrought iron bars have clearly rolled on their surface the distinguishing mark H. W. I. and can thus be readily identified.

Transverse Etch Wrought Iron Normal Size

For further information refer to our literature on wrought iron. It tells how to specify to insure getting the genuine.

Sizes and Details

Our local representative will be glad to furnish complete information and show samples. Write the home office for literature or special services.

Types

We are able to furnish products as listed below in either genuine wrought iron or steel in standard or special sizes.

Windows—
Pivoted
Projected—commercial and architectural
Continuous Top Hung
Basement
Labeled
Double Hung—plate type or hollow metal
Heavy Casements—hinged or projected
Residential Casements

Doors—
Swing
Slide
Hangar
Accordion
Special types

Screens—
Steel Bronze or Aluminum for all types of metal and wood windows.

Ornamental Iron—
Stairs
Fire Escapes
Railings
Grilles, etc.

Transverse Etch Steel Normal Size

Benjamin Franklin's lightning rod, after serving 158 years on St. Paul's Cathedral, London, shows no appreciable signs of serious corrosion. The surface is pitted, but the inner parts are as good as the day it was fabricated. The etched section (transverse) shows the same structure that has always characterized good wrought iron, the cinder layers which are such an efficient stop to progressive corrosion. (Compare this with the etch; the similarity is striking.)

Sales representatives in principal cities - - - Member Solid Section Steel Window Industry

Lupton Service

Lupton Service is maintained to assist you in solving your problems in daylighting and natural ventilation. We will welcome the opportunity to work with you in submitting tentative designs showing practical application of any of our products.

By careful study, research and experimentation, we are constantly producing refinements and new designs to meet the increasingly exacting requirements of modern building construction.

In the following pages we present information concerning our products, to assist you in the preparation of details and specifications. Irrelevant matter has been eliminated. Text is used to supplement drawings only where it is necessary to give a clear idea of construction or application of our products.

Details are typical, showing construction and general principles underlying satisfactory installation.

Lupton Products are designed to give full investment value and to this end we offer our service and cooperation in whatever degree required to obtain desired results in the natural daylighting and ventilating of your buildings.

ADDITIONS AND CHANGES

Since the printing of the 1931 Sweet's Architectural Catalogues, new products have been developed and changes made in existing ones. For convenience the more important additions and modifications are listed here. Newly developed products are as follows: Screened Casements, Master Casements, Georgian Windows, Master Office Windows, Master Projected Windows and Double Hung Windows Types G and H.

Details and Specifications for Detention Windows of the double hung type have been included. Corrugated Wire Glass details have been transferred to another part of Sweet's Catalogue under "Skylights." Casements previously referred to as Heavy Type Casements are now called Custom Built Casements. The number of standard types of Residence Casements has been revised in accordance with the recommendations of the industry.

Listing

To insure accurate estimates, all products should be accurately listed and located either in schedules on plans or in specifications. If more than one type of product or type of hardware is desired, each type should be separately listed and located or otherwise clearly designated.

Erecting

Where preferred, we will erect any of our products, but stock items such as Pivoted, Basement and Residence Casement Windows are usually more economically erected by the general building contractor.

All other Lupton Products, however, because of their special application should be erected by our own forces to assure satisfactory installation and service.

There is an erection specification prepared for each product which should be exactly followed and which will secure satisfactory use of product at reasonable cost.

Glazing

Glazing should be done by experienced steel window glaziers. We suggest that glazing of Pivoted, Basement, Commercial and Architectural Projected and Residence Casement Windows be handled by others. However, we will arrange for glazing of any of our products when this is preferred. When glazing, the glass should be bedded in putty to form a watertight seal and to prevent glass touching metal.

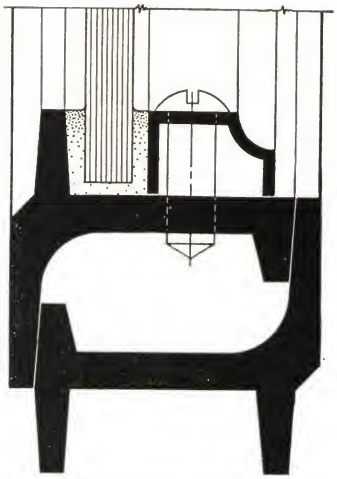
Putty

Always specify steel window putty for glazing steel windows. Ordinary putty intended for wood windows will not be satisfactory as it dries hard and cracks away from steel. Because various climates require variations in the ingredients of satisfactory putty, we recommend that putty be obtained from local sources. When this is impossible, putty may be secured from the Lupton Company or its sales representatives.

Calking

See calking specification for each product. The calking cement furnished by Lupton is elastic, dark gray in color and will not stain masonry. When Lupton applies calking, application is for weathertightness only and is understood not to be a finished pointing job. Erector spreads cement on edge of window and strikes off excess after window is set in place.

Painting



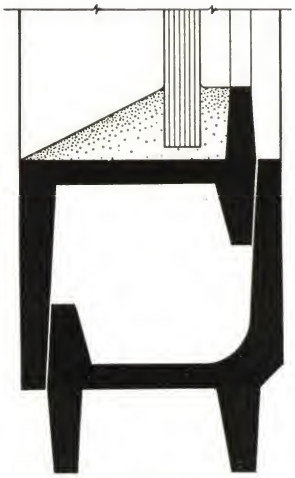
All Lupton Products are given a shop coat of paint before shipment. After glazing, no painting should be done until putty has set (about three weeks). It is advisable to hold the painting contractor responsible for cleaning plaster or other foreign matter from the weathering surfaces of the windows in order that it may not be painted over and cause imperfect contact.

LUPTON CASEMENTS

The several types of casements here illustrated have been developed by Lupton to meet the varying requirements of modern building construction.

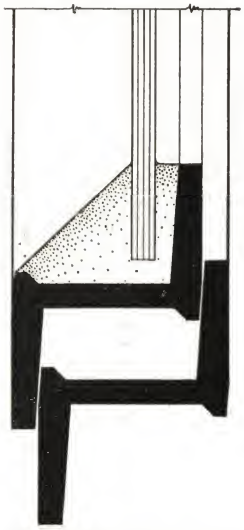
Their distinctive appearance, durability and continued ease of operation appeal to architect, owner and tenant.

Lupton Casements are made by skilled craftsmen, experienced in casement work and familiar with the high degree of perfection required in this type of window. The fine quality implied when casements are specified is assured by rigid inspection and close adherence to manufacturing standards.



Custom Built Casement
Typical Section
Full Size

Custom Built Casements

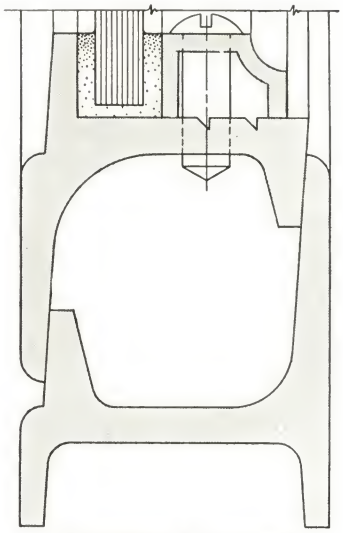


Custom built to meet the most exacting requirements for monumental buildings, etc. Built to sizes and designs as established by the architect. Typical units indicated on page 6 may be combined in steel plate frames or otherwise to form large windows. Usually inside glazed, though outside putty glazing is permissible.

Master Casements

A new design. Made in standard sizes, with or without muntins. Suitable for fine residences and similar type construction. Improved locking and operating hardware and screens offer an ingenious and practical solution to the screening problem. Outside glazed.

Master Casement
Typical Section
Full Size



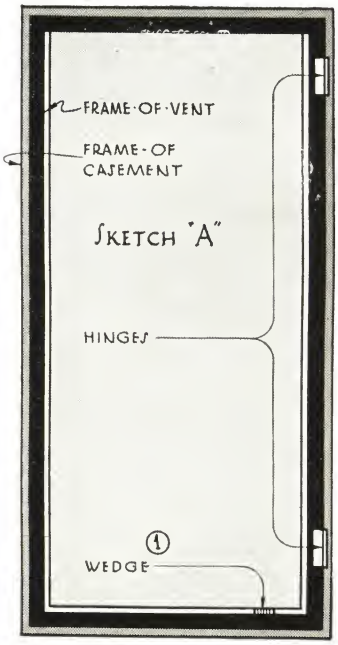
Residence Casement
Typical Section
Full Size

Residence Casements

Casements of standard and stock sizes and designs with improved hardware permitting operation without removal of screen. Used in residences or wherever a casement is required in smaller size openings. With or without muntins. Outside glazed.

Aluminum Casements

These casements made of a non-corroding alloy, never need painting and have a natural color quite in the spirit of modern decoration. Custom built. Inside glazing is recommended.



Aluminum Casement
Typical Section
Full Size

GEORGIAN WINDOWS

A new Lupton window of steel, the slender lines of which are reminiscent of the graceful Georgian period. Designed for use in residences, apartments or other buildings where architectural style or personal preference dictates the choice of a double hung window. Detailed information is given on pages 48 to 53.

CASEMENT GLAZING

To assure satisfactory service, weathertightness, and neat appearance, glazing should be done by experienced glaziers, using special steel window putty. (See page 3.)

Glazing Side Hinged Casements

All side hinged vents will eventually sag and rub on the bottom frame rail unless the following correct glazing method is used:

1. Check casement to see that vent seats properly and that outer frame has not been twisted or sprung in masonry opening.
2. Bed vent frame with putty.*
3. Set wood wedge and glass in position in vent frame as shown in Sketch "A."
4. Open and close vent several times to seat glass.
5. Open the vent slightly and with a chisel or other lever placed between bottom of vent and frame of window at point (2) Sketch "B" spring entire vent upward. This will open up the space between vent and glass at point (3) Sketch "B." Insert another wood wedge at point (3) before pressure is released on lever.
6. Wedges must be tight and are left permanently in place. Puttying can now be completed or glazing beads attached.

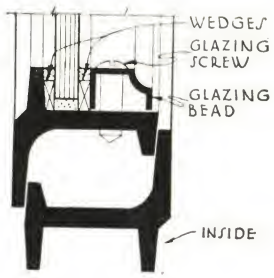
Outside Glazing

Glass should be bedded in putty* and small wooden wedges inserted to prevent squeezing out putty due to pressure on glass.

Glazing stops are carefully fitted and attached in our shop. When glazing, care should be taken to get each piece of moulding back in its original position.

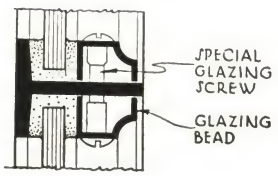
Several types of glazing beads are available for steel casements. All have the same overall dimensions. Standard type (Sec. 377) is cold rolled from 16 gauge steel.

Alternate types are, a hot rolled steel bead (Sec. 379) retaining the advantages of a solid bead without needless weight; and an extruded bronze bead (Sec. 380). An extruded bronze bead (Sec. 378) with a channel in its upper surface for collecting condensation may be had if desired, but usually is unnecessary.



Aluminum casements have aluminum beads fastened with aluminum screws.

Inside Glazing



Glass should be bedded in putty* and small wooden wedges inserted to prevent squeezing out of back putty. Glazing angles or clips should then be attached and face putty carefully applied and beveled so as to preserve even sight lines.

Outside glazing is not recommended for aluminum casements.

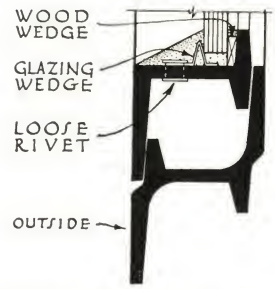
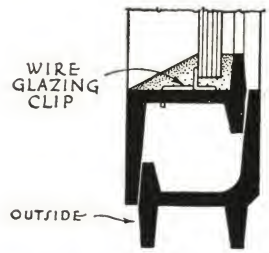
CUSTOM BUILT CASEMENTS

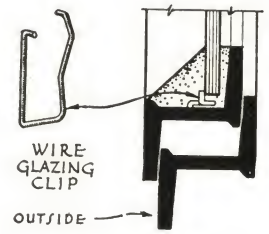
MUNTIN



ALUMINUM CASEMENTS



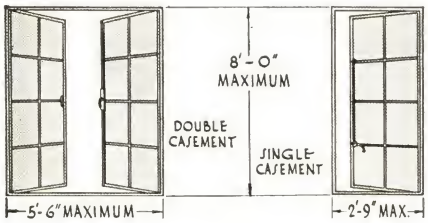
GLAZING STOPS FOR CUSTOM BUILT CASEMENTS



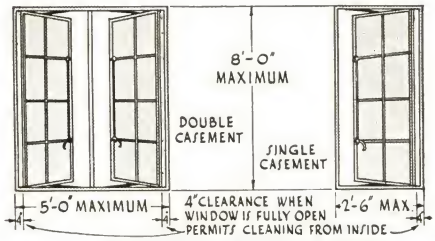
Scale :- All sections shown here are Half Actual Size.

MASTER OFFICE AND PROJECTED WINDOWS

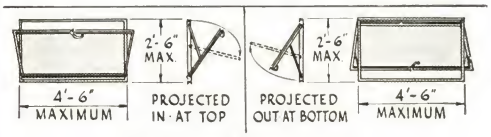
MASTER CASEMENTS



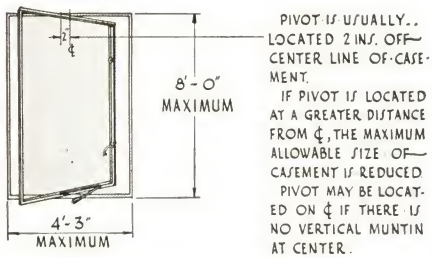
RESIDENCE CASEMENTS



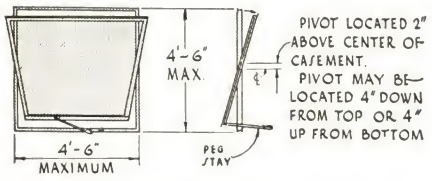
CUSTOM BUILT CASEMENTS

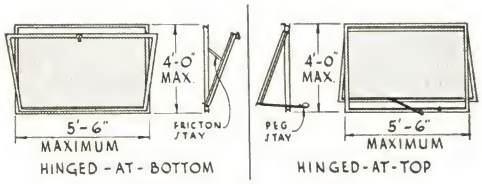


Custom Built Casements are designed for use in the most lasting forms of building construction—monumental and public buildings, university buildings, libraries, fine residences, clubs, hotels and like structures. Built with the finest craftsmanship to sizes specified by the architect. Lupton will gladly co-operate in submitting tentative designs and details.



Side Hinged Casements





Projected Casements

Vertically Pivoted Casements

Horizontally Pivoted Casements

Top and Bottom Hinged Casements

Side Hinged Casements

Swing-out casements are recommended in preference to swing-in or vertically pivoted casements. In addition to their superior weathering, they do not interfere with draperies when open.

Hinges are bronze butts or malleable iron friction hinges, as specified.

Single casements and double casements with fixed meeting stile have locking handles. Double, folding casements (illustrated) have exposed or concealed cremone bolt. Sliding adjusters are used if friction hinges are not specified.

Projected Casements

Made in three types as illustrated. Adjustable bronze friction device hold casement open at any angle without stay bars, etc. There is no protruding hinge, yet both sides of glass can be cleaned from inside the building. Can be readily screened and shaded.

Out-at-side type have locking handles. Double casements must have fixed meeting stiles.

Out-at-bottom and In-at-top types are usually used for transoms, but may be placed one above another to form a large window. Operation is by locking handles or spring catches. Cannot be used with mechanical operators.

Vertically Pivoted Casements

Not recommended, except where width desired is too great for side hinged casement. Pivot is usually placed 2 in. off center. Pivot may be nearer jamb but this reduces maximum size.

Casements are usually equipped with locking handles and peg stays.

Horizontally Pivoted Casements

Usually used for transoms or as ventilating units in large windows where casement operators described on pages 00 to 00 are used. When hand operated, top and center pivoted casements within reach are equipped with peg stays. Bottom pivoted may have spring catch or cam handle and friction stays.

Top Hinged and Bottom Hinged Casements

Used as transoms and with mechanical operators described on pages 21 to 25. When hand operated, top hinged casements have stay bar; bottom hinged casements have spring catch or locking handle and friction stay.

General

Fixed units may be of any size within reasonable limits.

Casements may be inside or outside glazed and may be made with or without muntins.

Units may be combined to form composite windows using mullion and impost bars, or 13 gauge formed steel plate mullions and imposts. See pages 10 to 14.

When viewed from the outside a left-hand casement has hinges on left side and a right-hand casement has hinges on right side.

Hardware is shown on pages 8 and 9.

CUSTOM BUILT CASEMENTS

SPECIFICATIONS

Work Included

1. Furnish and install where shown on drawings, Lupton Steel Custom Built Casements as manufactured by David Lupton's Sons Co., Philadelphia, Pa.

Materials

2. Frame and ventilator members shall be made of copper-bearing rust-resisting steel specially rolled in solid, one-piece sections. Bars shall be straightened and sand-blasted.

3. Muntins shall be specially designed steel T bar section.

4. Vertical mullions shall be specially designed steel H section. Imposts shall be specially designed steel lug bars.

Note:—Two sizes of lug bars are standard, the width of the section being 4 in. for the large bar and 2½ in. for the small one. The large bar is used for the larger multiple unit casement windows.

Construction

5. All casement windows shall be designed for inside glazing with metal glazing stops (or, specify outside glazing).

6. All casement windows shall be straight and true, members in alignment and surfaces in a plane.

7. Ventilator and frame members shall be mitered at corners and solidly butt welded. Exposed welded surfaces shall be ground flush with members. The frame and ventilator shall form a two-point, flat, continuous, weathering contact.

8. Muntin bars shall be continuous from top to bottom and from side to side between frame members or ventilator members. They shall be attached to frame members or ventilator members by tenoned, riveted joints and shall be interlocked and welded at their intersections so as not to decrease their ultimate strength.

9. Provide mullions and bolts for attachment wherever two or more units are placed side by side in an opening.

10. Provide imposts and bolts for attachment wherever two or more units are placed one directly above the other in an opening.

11. At the head of all open out ventilators a No. 16 gauge formed steel hot galvanized weather bar shall be used, except when condition necessitates the use of a lug bar, the lug bar shall be bent and used as weathering bar.

12. Furnish No. 14 gauge steel strap anchors where shown on details for anchoring in masonry.

*Note:—(a) Specify No. 13 gauge steel continuous anchors if desired.**

*(b) If plate subframes (shown on pages 13 and 14) are desired, specify: "Frames formed of 13 ga. steel plate with profile as shown on details shall be furnished. Units shall be welded and exposed part of weld ground flush."**

Glazing Stops

13. Glazing stops shall be of detail shown on window manufacturer's standard drawings and shall be made of drawn rolled steel. All stops shall be accurately coped and fitted.

Note:—See details on page 15.

Hardware

14. Hinges shall be attached and painted with casements in factory.

Note:—Five types of hinges are available. See pages 8 and 9. Specify the type desired.

(a) Solid bronze butt hinges with steel pins.

*(b) Close-up friction hinges of malleable iron or bronze.**

*(c) Extended friction hinges of malleable iron or of bronze.**

15. Hardware listed below shall be fitted in factory, and shipped unattached, carefully packed to prevent damage.

Note:—Standard hardware is illustrated on the two pages immediately following. Types required (see preceding page) should be listed here. Standard hardware is solid bronze with polished (U. S. No. 9) finish (not lacquered). Other finishes can be furnished if definitely specified. Hardware can be furnished also in malleable iron with painted finish or bronze plated. Malleable iron must be used for Underwriters' Labeled casements. See pages 19 to 21 for Casement Door Hardware.*

*Screened Casements**

Note:—Where casements are to be screened, hardware and screens may be similar to that for Screened Master Casements. See pages 31 and 32.

Calking Cement

16. The window manufacturer shall furnish non-staining elastic calking cement (as indicated on window manufacturer's standard details) in quantities sufficient to make head, sill, jambs, mullions and imposts weathertight. Wooden filler-strips shall be furnished and used where indicated on details. (See page 3.)

Note:—Where casements are to bear Underwriters' label, filler strips must be of metal.

Erection

17. All casement windows shall be erected in prepared openings by the window contractor. (See page 3.)

18. All casement windows shall be set plumb and true, properly aligned and securely anchored before glazing. Mullions and imposts shall be bolted securely to frames. Calking cement and filler-strips shall be neatly applied at points indicated on window manufacturer's standard details.

Note:—Include in the masonry specifications that all masonry openings shall be accurately constructed in accordance with the installation details for Casement Windows. All grouting, pointing, etc., should be done by the mason contractor after the windows are set.

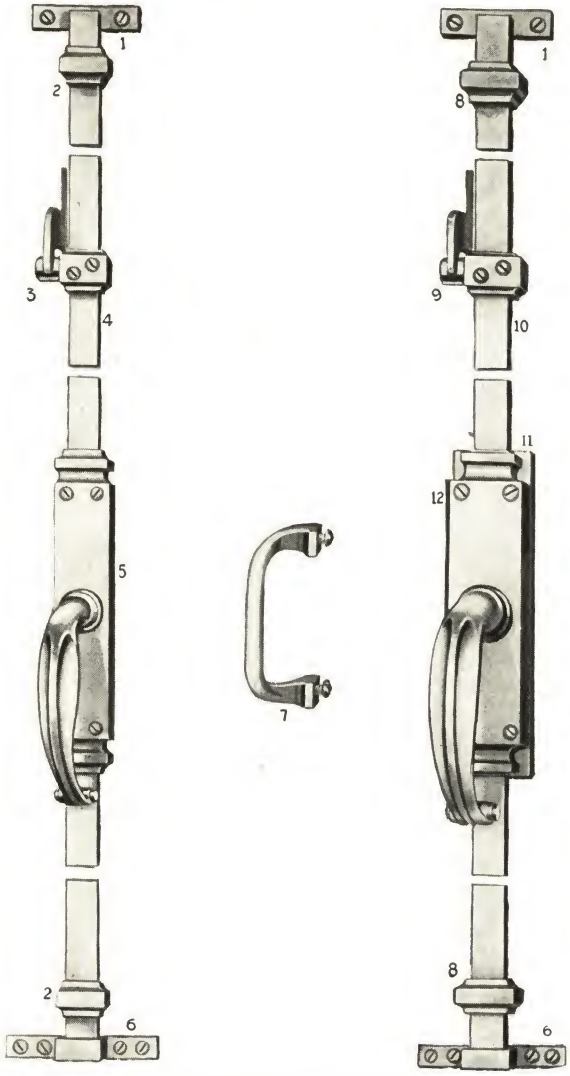
Glass and Glazing

Note:—(See also pages 3 and 5). Specify glass and glazing under proper heading elsewhere in general specifications of other trades.

(a) Do not specify single thickness glass.

(b) Specify a high grade steel Casement putty.

(c) Specify that all casement windows shall be glazed from the inside, the glass set in a bed of putty and held by the Lupton metal glazing stops, (or)



(d) That all casement windows shall be glazed from the outside, the glass set in a bed of putty and held by glazing clips.

**Note*

No. 13 gauge steel continuous anchors, friction hinges of malleable iron or bronze, plate subframes, screens, and special hardware, or special hardware finishes, will be furnished if clearly specified, indicated on drawings, and mentioned in contract for windows.

HARDWARE for CUSTOM BUILT CASEMENTS

Hardware numbers given are for solid bronze hardware highly polished (unless otherwise noted). Hardware is also available in bronze in several special finishes and in malleable iron painted, or bronze plated. See note at bottom of page 7. Malleable iron must always be used on Underwriters' casements. See pages 19 to 21 for Casement Door Hardware.

Cremone Bolts for double casements consists of the following parts:

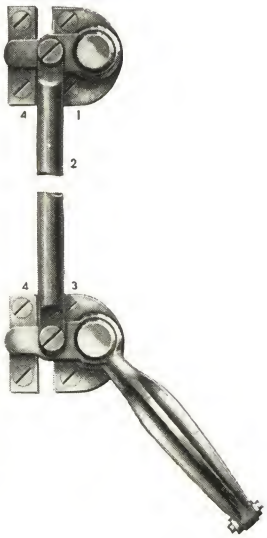
For casements up to 7 ft. high:

1. *Keeper No. 291 at top and bottom of swing out casements. Or*
6. *Keeper No. 285 at top and bottom of swing in casements.*
2. *Bar Guides No. 293 (spaced about 1 ft. apart).*
3. *Center latches and keepers (spaced about 2 ft. apart).*

No. 286 above handle.
No. 292 below handle.

4. *Bronze bar ½x¼ in.*
5. *Handle and case No. 290.*
7. *Pull handle No. 237.*

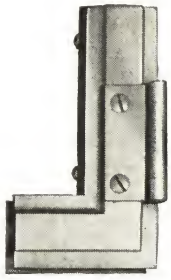
For casements over 7 ft. high:



1. *Keeper No. 291 at top and bottom of swing out casements. Or*
6. *Keeper No. 285 at top and bottom of swing in casements.*
8. *Bar Guides No. 340 (spaced about 1 ft. apart).*
9. *Center latches and keepers (spaced about 2 ft. apart.)*

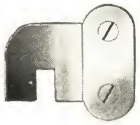
No. 337 above handle.
No. 338 below handle.

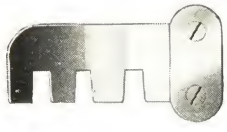
10. *Bronze bar ⅝x¼ in.*
11. *Malleable iron base plate No. 146.*
12. *Handle and case No. 256.*
7. *Pull handle No. 237.*



Double locking device for side hinged, swing out and vertically pivoted casements 4 ft. to 8 ft. high consists of the following:

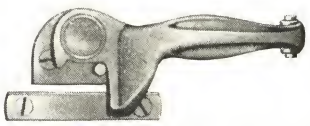
1. *Auxiliary latch No. 390.*
2. *½ in. steel tube.*
3. *Locking handle (as shown No. 392 or opposite hand No. 393).*
4. *Wedge Plate No. 601. This device is also used for swing in casements 4 ft. to 8 ft. high. When used on swing in casements wedge plates are replaced by single or triple keepers shown at bottom of this page.*



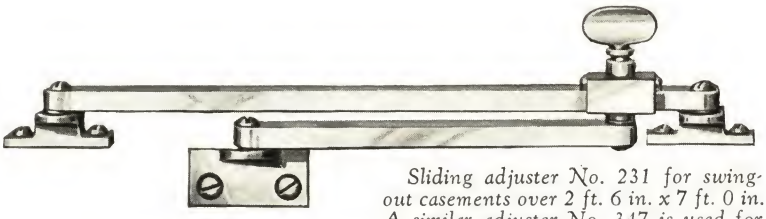


Locking handle No. 386 and wedge plate No. 601 for side hinged or vertically pivoted casements up to 4 ft. high. (Opposite hand No. 387.)

Bronze butt hinge No. 2200 used on hinged casements unless another type is specified. Hinges have steel pins and painted finish.

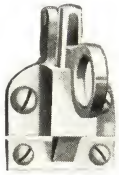


Single Keeper No. 396 for swing in casements (opposite hand No. 397).



Triple Keeper No. 398 for swing in casements (opposite hand No. 399).

HARDWARE for CUSTOM BUILT CASEMENTS



Hardware numbers given are for solid bronze hardware highly polished (unless otherwise noted). Hardware is also available in bronze in several special finishes and in malleable iron painted, or bronze plated. See note at bottom of page 7. Malleable iron must always be used on Underwriters' Casements. See pages 19 to 21 for Casement Door Hardware.

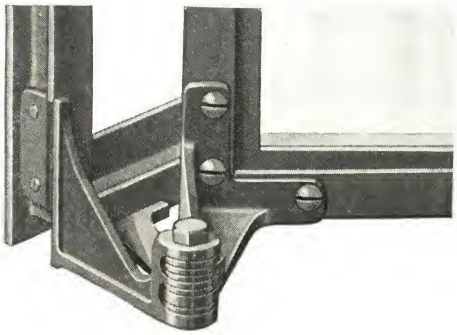
Locking handle No. 374 for open-out-at-bottom ventilators.

Sliding adjuster No. 231 for swing-out casements over 2 ft. 6 in. x 7 ft. 0 in. A similar adjuster No. 347 is used for smaller casements not less than 1 ft. 6 in. wide.

Spring catch No. 243 for open-out-at-bottom ventilators beyond reach from floor.

Peg stay No. 209 for horizontally pivoted casements. A similar stay No. 249 or a stay terminating in a scroll (No. 250) is used on vertically pivoted casements.

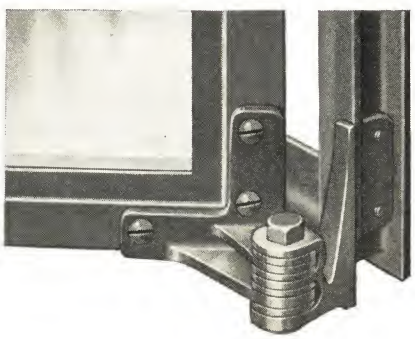
Locking handle No. 388 for open-in-at-top ventilators.



Interior sliding adjuster No. 236 for swing-in casements.

Spring catch No. 248 for open-in-at-top ventilators beyond reach from floor.

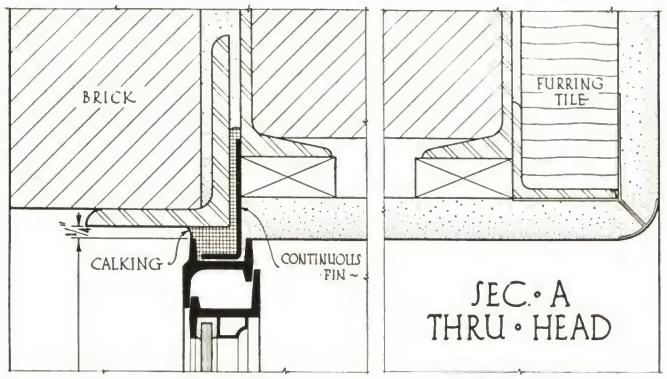
Pull down ring No. 358 for open-out-at-bottom ventilators beyond reach from floor.



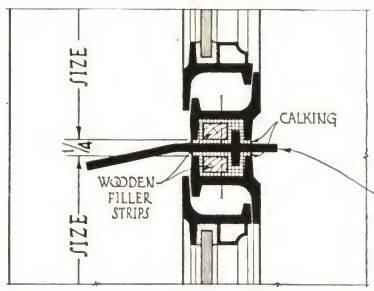
Friction hinges hold casements at the desired degree of opening up to 180° without the use of adjusters. Made of malleable iron or bronze with painted finish. Bronze washers and cadmium plated pins assure smooth operation.

(At left) Extended hinge permits cleaning the glass from inside the building. Opens 180°.

(At right) Close-up hinge. Opens 180°.



Note: Application of hinges is limited by the width of casements as follows:



Minimum over-all width of casements	With extended hinge	With close-up hinge
Single Casement	1 ft. 4⅝ in.	8⅝ in.
Double Casement	2 ft. 7¼ in.	1 ft. 3¼ in.

CUSTOM BUILT CASEMENTS

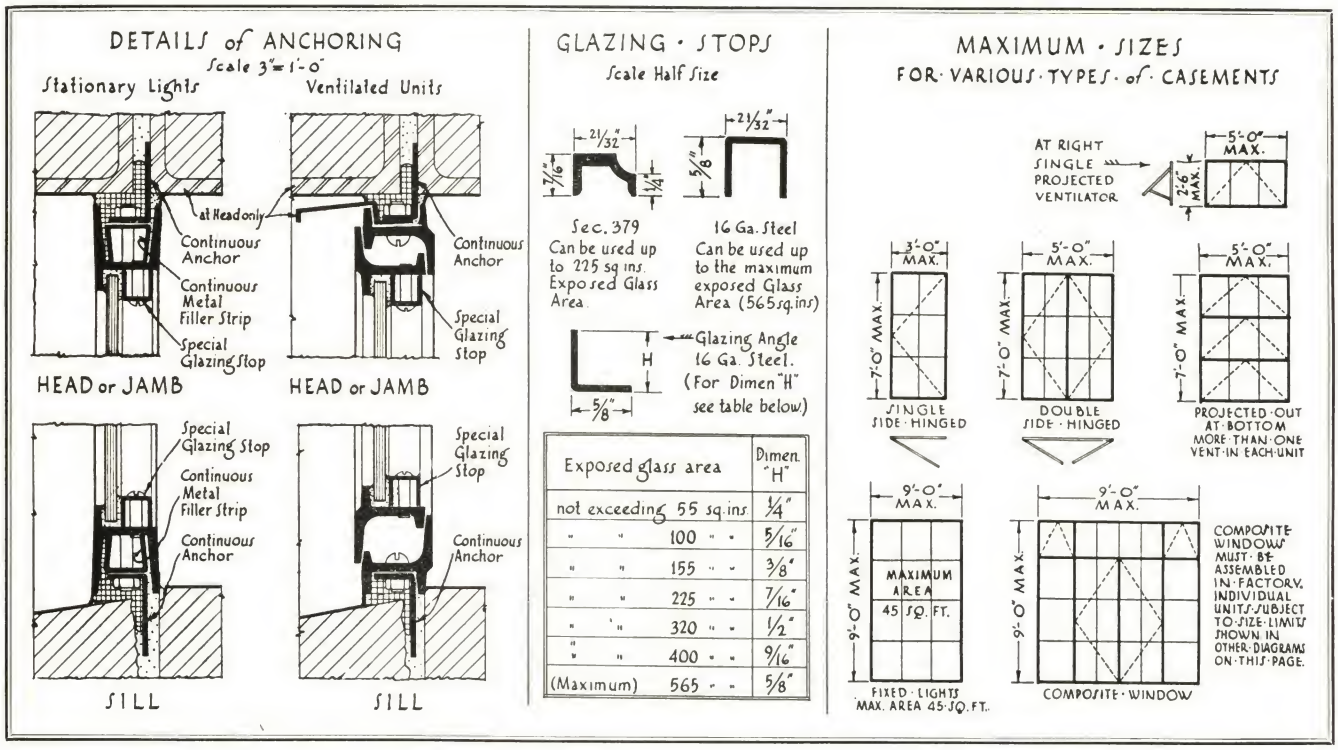
with Underwriters' Labels

Custom Built Casements may receive underwriters' labels, subject to the following limitations:

1. Maximum sizes—see diagrams.
2. Construction is essentially the same as for non-labeled casements except:

(a) All ventilators must open out.



(b) Windows composed of two or more units must be assembled in factory and filler strips used in calking mullions and imposts must be metal.

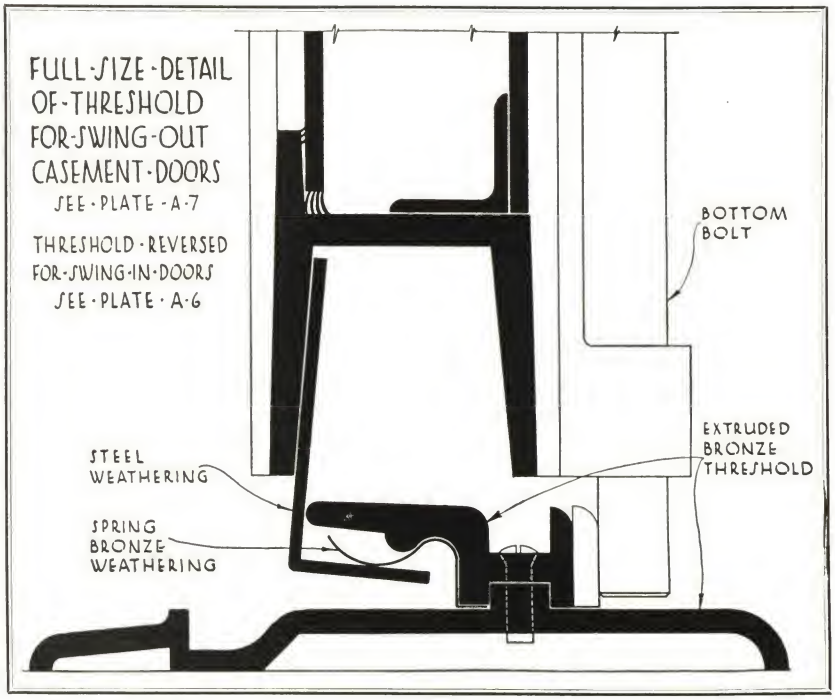
(c) Continuous anchors must be used at head, jambs and sill.

(d) Hardware must be malleable iron (bronze plated if desired). Bronze hinges can be used if vents are equipped with steel stop pins.

(e) Glass must be ¼" thick wire glass.

(f) Maximum exposed glass area is 565 sq. in. and steel glazing stops must be used. (See details.)

Exposed glass area	Dimen. "H"
not exceeding 55 sq. ins.	¼"
" " 100 " "	5/16"
" " 155 " "	3/8"
" " 225 " "	7/16"
" " 320 " "	½"
" " 400 " "	9/16"
(Maximum) 565 " "	5/8"



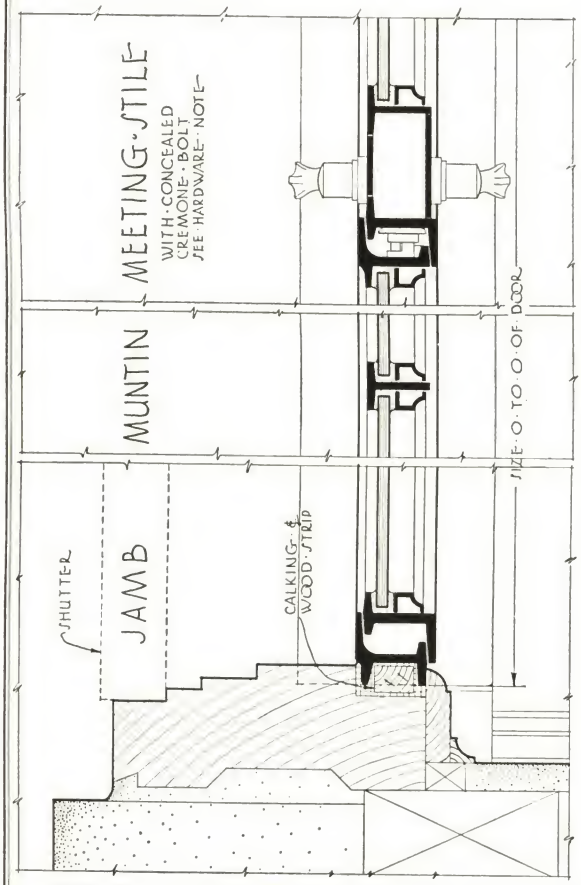
CASEMENT DOORS

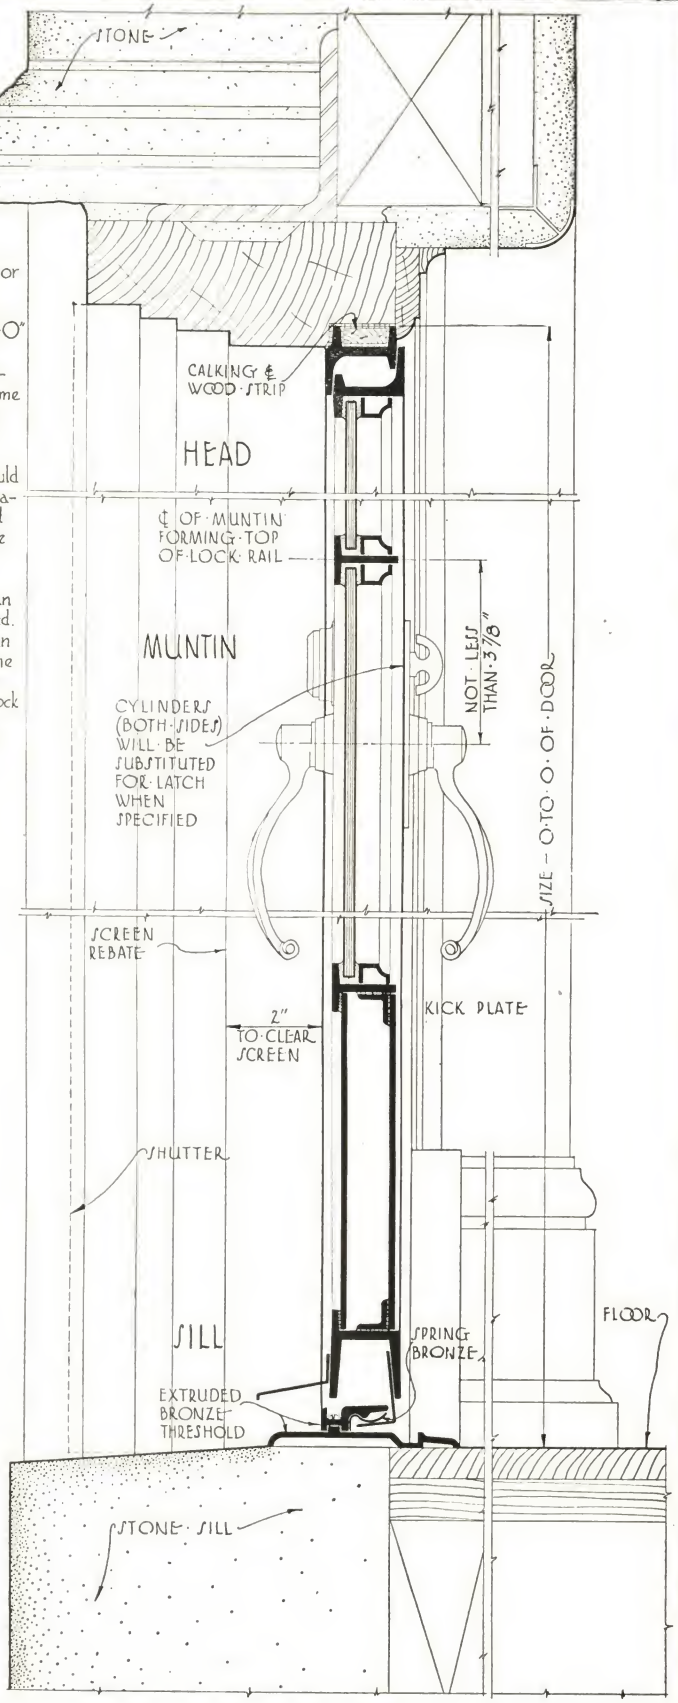
Custom Built

These doors are made in sizes and designs specified by the architect. Materials and construction are the same as for Custom Built Casements, specifications for which are given on page 7.

Casement doors have a patented, extruded bronze threshold and usually a 13 gauge steel panel extends across the bottom forming a kick plate.

Doors are hung on bronze butts with steel pins and may be equipped with friction stays or door stops as desired. Methods of operation and locking are indicated in the details on pages 19 and 20. Detail on page 21 shows correct method for framing lock to avoid glass breakage. See also page 38.





PLAN
Scale 1/4" = 1'-0"

• NOTE •
Doors may be single or double. Maximum sizes (doors with kick plates) single 2'-9" x 9'-0" double 5'-6" x 9'-0" Specifications for casement doors are the same as for windows, except that 13 ga. steel kick plate (if desired) and bronze threshold should be included in specifications. Muntins cannot be entirely omitted, see Plate A-8.

• HARDWARE •
Casehold adjusters can be furnished if specified. Locking hardware can be concealed cremone bolt as shown on this drawing or mortise lock and top and bottom bolt as shown on Plate A-7.

CASEMENT OPERATORS

In banks, libraries and other buildings where large multiple unit casements are used it is necessary to provide a means for operating casement ventilators that are beyond reach from floor. For this purpose Lupton has developed a screw type operator in several forms to suit varying requirements.

There are two general types of operators, those operated by an endless cord, and those operated by a crank and shaft.

Cord Operation

This type operator is designed for operating single ventilators (usually transoms). It has two forms which are indicated on next page.

One form has a grooved pulley attached at the center of a shaft mounted on the stationary frame of the ventilator. Shaft is threaded at one end with a right hand thread and at the opposite end with a left hand thread. As the shaft is revolved (by pulling the endless cord which passes over the pulley) two bronze nuts travel along the threaded portions of the rod opening or closing the ventilator.

The other form (segment type) has a pulley with a threaded core running on a threaded bronze rod bent in an arc. As the pulley revolves it moves backward or forward on the rod opening or closing the ventilator. Where ventilators open out rod is attached to ventilators. Where ventilators open in rod is attached to frame.

Crank and Shaft Operation

This method is used where a number of ventilators are to be operated simultaneously.

With the horizontal screw shaft operator (page 25) the degree of opening is limited by the width of the ventilator. This should be remembered when designing.

The vertical screw shaft operator (pages 23 and 24) will operate a greater number of ventilators and a longer length of shaft than the horizontal type and the degree of opening is not limited by the width of the ventilator, but not more than two tiers of ventilators can be operated from one crank.

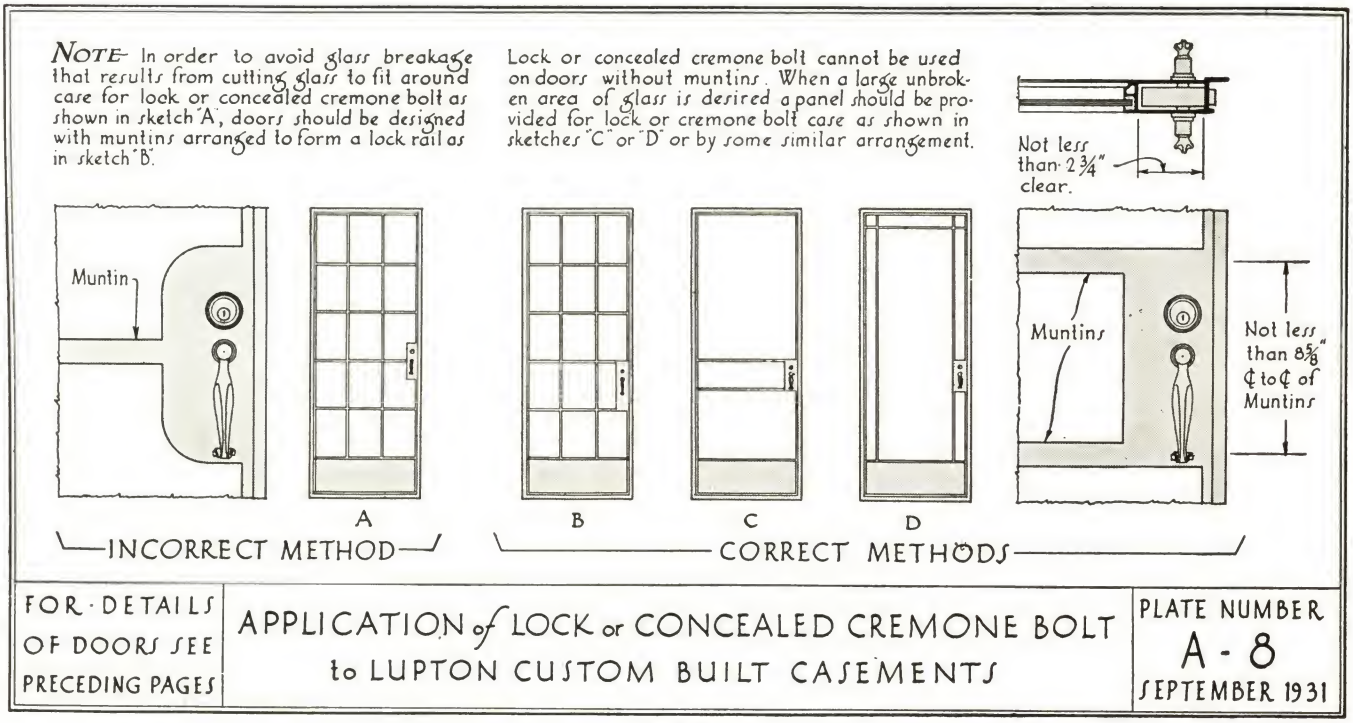
SPECIFICATIONS

Work Included

1. Furnish and install where shown on drawings Lupton Casement Operator Screw Type, manufactured by DAVID LUPTON'S SONS CO., Philadelphia, Pa.

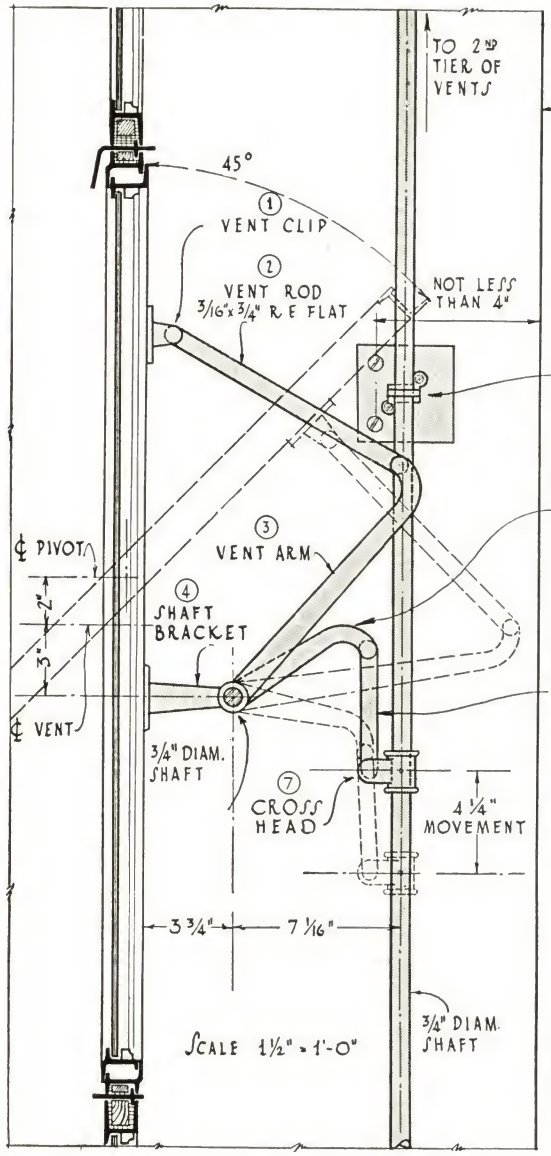
Material and Construction

Note:—Operators are available in three types.

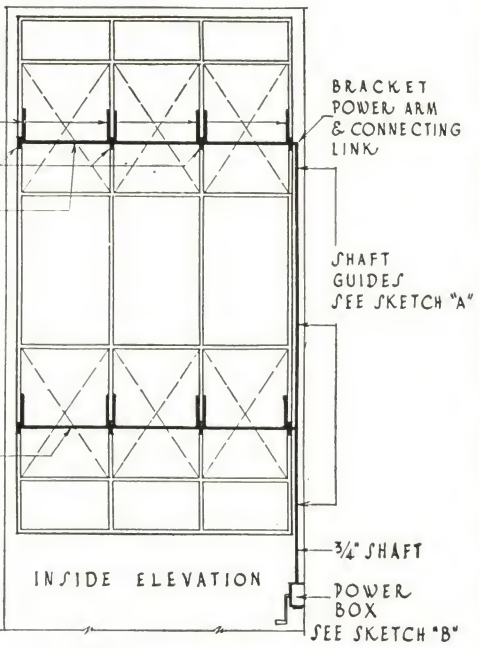


(A) Horizontal, vertical or curved screw shaft operated by cord and pulley.

(B) Horizontal screw shaft operated by vertical shaft, crank and miter gears.



(C) Vertical screw shaft, operated by crank and miter gears.



2. (A-1) Operator shall have a $\frac{3}{8}$-in. diameter steel shaft threaded with right- and left-hand threads mounted on three malleable iron brackets attached to frame of casement. Each threaded portion of the shaft shall be equipped with an adjustable bronze traveling nut. Sash rods shall be of $\frac{3}{16}$x$\frac{3}{4}$-in. round edge high car-

PLATE NO W-3
AUGUST 1929

ALUMINUM CASEMENTS

Casements made of Aluminum add a distinct note in harmony with modern decoration, while the enduring and non-corroding properties of the metal give assurance of continued fine appearance with minimum maintenance cost.

Casement members are formed by extruding which produces bars of great density and uniformity. The alloy used compares favorably with mild steel in strength with but approximately one third the weight. Bars are assembled by a welding process that produces a strong, smooth, solid joint.

Casements are usually furnished with a natural soft gray lustrous finish, but may have a highly polished reflecting finish or a sand blast finish if preferred. The polished finish must be protected with several coats of clear varnish or other coating.

Side hinged open-out casements are recommended wherever possible to use them. Maximum sizes are given on page 28. Composite windows can be built up as shown on page 29.

Aluminum is not appreciably affected by normal atmospheric conditions, steam or boiling water. Sea water affects it to a very small extent. Precautionary measures should be taken to prevent the use of ammonia, caustic alkalies, hydrochloric, nitric and strong sulphuric acids in cleaning preparations for walls or windows as these substances react with aluminum. Aluminum with natural finish gradually weathers to a darker tone but the original appearance may be restored, if desired, by rubbing with fine steel wool or emery.

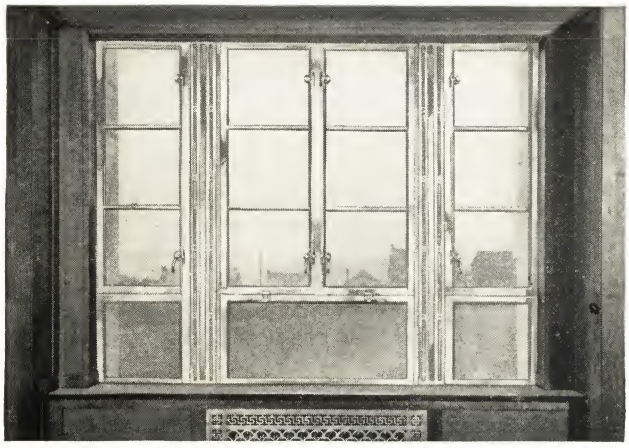
SPECIFICATIONS

Work Included

1. All windows called for in these specifications or shown on the drawings shall be Aluminum Casement Windows, manufactured by DAVID LUPTON'S SONS CO., Philadelphia Pa.

Material

2. The members shall be of special alloy, extruded in solid one-piece sections.



Construction

3. The weathering of ventilators shall be made by double contacts of the members without the use of built up or added sections.

4. All members shall be accurately straightened and true. All joints shall be welded, eliminating all riveted joints. Exposed welded surfaces shall be ground flush with members. Plates to receive handles shall be solidly welded in place. Face of members shall be free from hammer marks and sight lines shall be carefully preserved. All aluminum casements shall be designed for inside glazing with glazing stops.

Glazing Stops

5. Glazing stops shall be of the details shown on window manufacturers' standard drawings and made of extruded aluminum sections. All glazing stops to be accurately and carefully fitted and fastened with low round head, white bronze screws.

Aluminum Casements in Research Laboratory Building of Aluminum Company of America at New Kensington, Pa. Henry Hornbostel, Architect, P. R. L. Hogner, Assoc. Architect.

Finish

6. Casements shall have natural extruded aluminum finish, brushed and dipped in cleaning bath before leaving the factory.

Note:—Sandblast or highly polished and lacquered finish may be specified if desired.

Hardware

7. Hinged casements shall be hung on specially designed aluminum friction hinges constructed with non-corrosive parts. All friction hinges to be securely attached to frame and ventilator members with steel screws, heavily cadmium plated.

Note:—Where friction hinges are not desired, specify cadmium-plated bronze hinges and white bronze sill adjusters. Sill adjusters shall be substantially made and shall hold the window at various angles of opening.

8. Where projected ventilators occur, all parts of projected movement shall be made of special alloy aluminum.

9. All hardware shall be white bronze attached with white bronze screws. Strike wedges are white bronze. All hardware shall have dull finish, lacquered.

Calking Cement

10. The window manufacturer shall furnish non-staining elastic calking cement (as indicated on window manufacturers' standard details) in quantities sufficient to make head, sill, jambs, mullions and imposts weathertight. Wooden filler-strips shall be furnished and used where indicated on details.

Note:—See page 3.

Erection

11. All Aluminum Casements shall be erected in prepared openings by the window contractor.

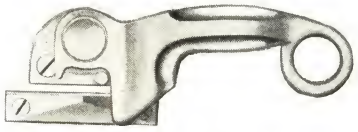
12. They shall be set plumb and true, properly aligned and securely anchored before glazing. Mullions and imposts shall be bolted securely to frames. Calking cement and wooden filler-strips shall be neatly applied at points indicated on window manufacturers' standard details.

Note —See page 3.

Note —Include in the masonry specifications that all masonry openings shall be accurately constructed in accordance with the installation details for Aluminum Casements. All grouting, pointing, etc., should be done by the mason contractor after the windows are set.

Glass and Glazing

Note:—(See also pages 3 and 5.) Specify glass and glazing under proper heading elsewhere in general specifications of other trades.



(a) Do not specify single thickness glass.

(b) Specify a high grade metal casement putty.

(c) Specify that aluminum casements shall be glazed from the inside, the glass set in a bed of putty and held by the Lupton aluminum glazing stops.

HARDWARE for ALUMINUM CASEMENTS

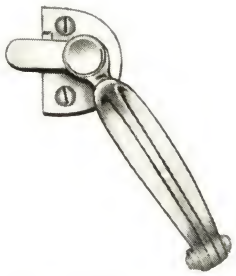
Hardware is white bronze with dull, lacquered finish unless noted otherwise.

Ring handle No. 432 used in addition to Pull Down Ring No. 439 for pole operation of open out at bottom ventilators

Ring handle No. 429 for pole operation of open in at top ventilators.

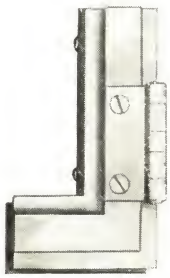
Spring catch No. 422. An alternate to handle No. 429 for pole operation of open in at top ventilators.

Locking handle No. 430 for open out at bottom ventilators.

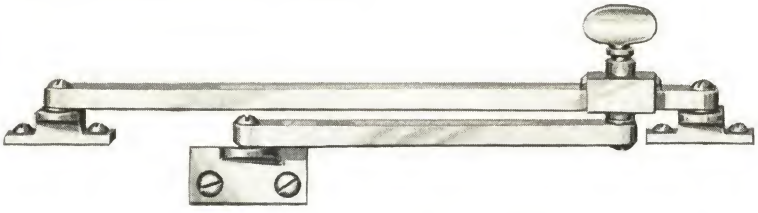


Locking handle No. 427 for open in at top ventilators.

Cremone bolt for double casements consists of the following:

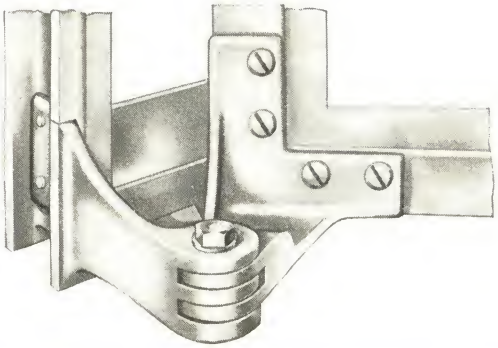


1. *Keepers for top and bottom of casements.*
2. *Bar guides (spaced approximately 1 ft. apart).*
3. *Center latches and keepers (spaced approximately 2 ft. apart).*
4. *Bar 1/2x1/4 inches.*
5. *Handle and case.*
7. *Pull handle for "dead" leaf.*

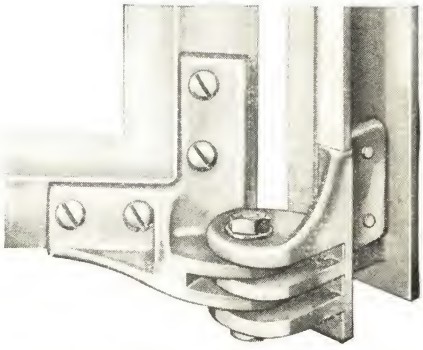


Bronze butt hinge heavily plated with cadmium or nickel.

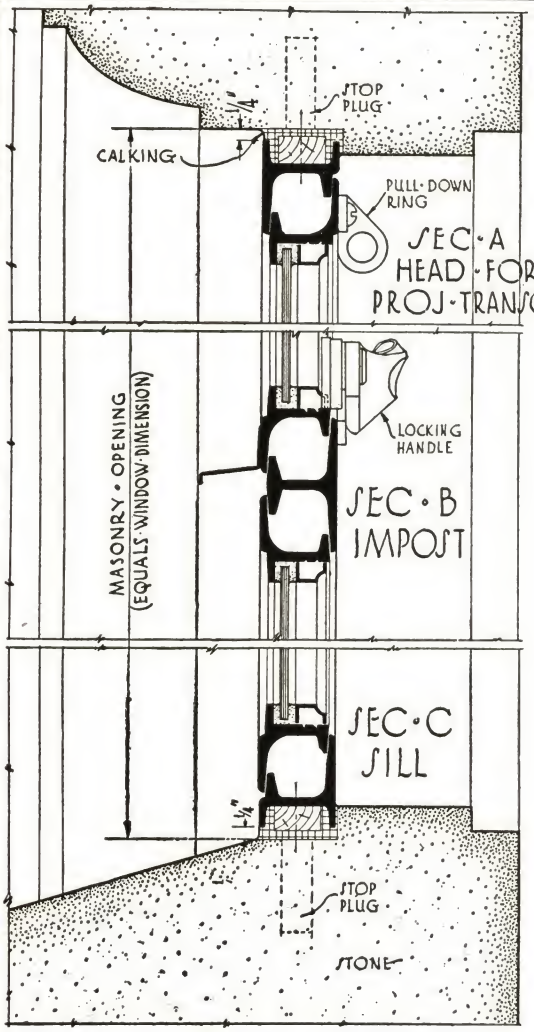
Locking handle No. 433 (Opposite hand No. 434) for side hinged casements not over 4 ft. high.



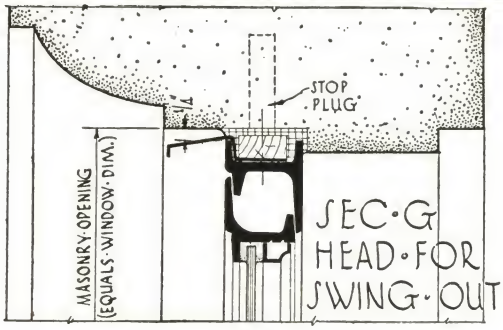
Double locking device for casements 4 ft. to 8 ft. high is similar to the one shown on page 8, and consists of the following parts: Auxiliary Latch No. 437, 1/2-in. white bronze tube, and Locking Handle No. 435 (or opposite hand No. 436).

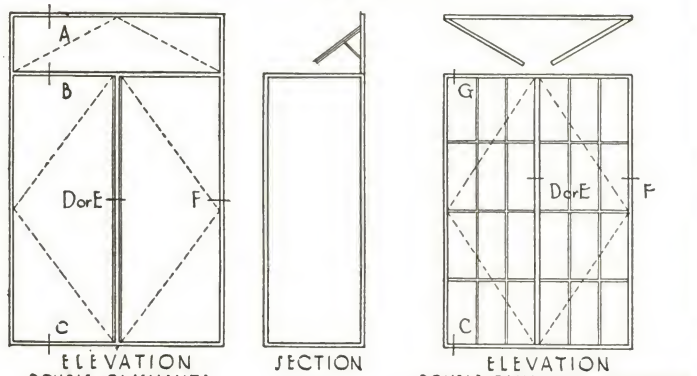


Sliding adjuster used only on side hinged casements with butt hinges.



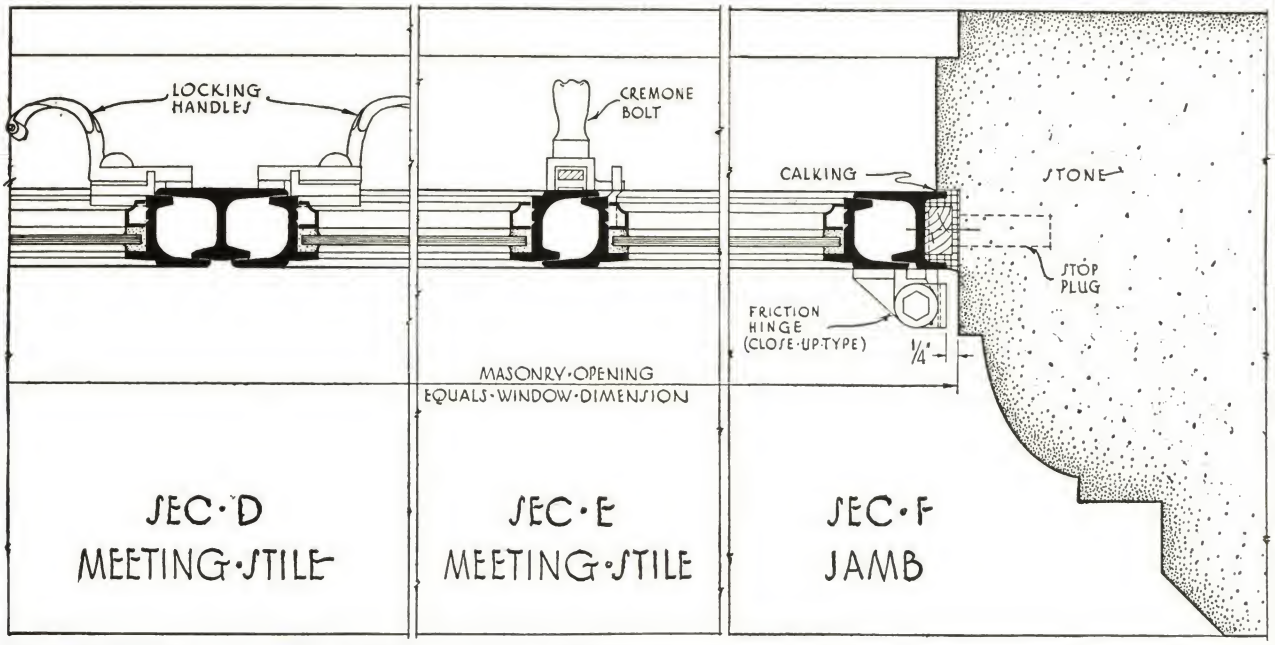
Friction Hinges of aluminum hold casements at any degree of opening up to 180° and make sliding adjusters unnecessary. There are two types as shown below. Hinge pin is steel, extra heavily cadmium plated and friction is adjustable.





At left. Extended type friction hinge which permits cleaning outside of window from inside the building.

At right. Close-up type friction hinge.



MAXIMUM SIZES

Projected Out at Bottom		4'-6" wide	x 2'-6" high
Side Hinged Casements	Single	2'-9" "	x 8'-0 "
	Double	5'-6" "	x 8'-0 "

HARDWARE

See pages 27 and 28. All locking hardware is white bronze, dull finish. Single casements have locking handles. Double or triple locking device is furnished when casement is more than 4'-0" high.
Double casements may have locking handles as in Sec. D or cremone-bolt as in Sec. E.
Projected transoms beyond reach have ring-type locking handles.

SCREENED CASEMENTS

Lupton Screened Casements include Custom-built and Aluminum Casements, as well as Master and Residence Casements. Graceful, newly designed, screened casement hardware and the narrow frame, all-aluminum screens combined with any of these types of casements produce ideal windows that can be operated or locked without opening screens.

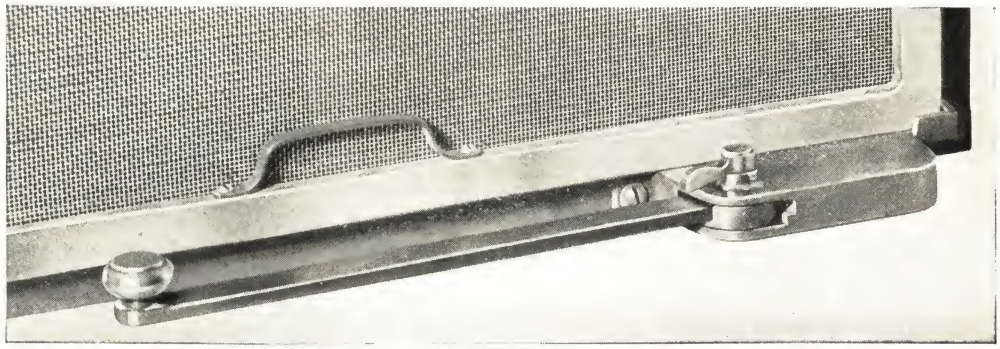
New simplicity, effectiveness and convenience are achieved in the "Screened" Casement windows produced by Lupton. Casements can be opened, closed and locked without removing screens. Screens can be removed and replaced for washing the windows, without disturbing draperies.

All hardware has been redesigned and relocated in such manner that a new type, all-aluminum screen can be set directly against the casement frame where its slender lines blend with the frame in the most unobtrusive manner imaginable. The locking latch on double casements is set on the meeting stile (or dividing bar) between the adjacent screen frames, locking or releasing both ventilators by a simple in-and-out motion. In single casements the latch is at the side of the frame close to the window reveal. In neither case does the operation of the locking-latch interfere with the screens.

The windows are opened, closed and locked in any position by means of a new rattle-proof underscreen operator which is attached directly to the casement at the sill line.

The screen itself is held in place by means of two spring clips near the head and two small corner brackets at the bottom. The head of the screen is slipped above the upper clips without disturbing draperies, shades or Venetian blinds and without removing the latch or casement operator, and then dropped down a fraction of an inch seating it into the lower brackets and engaging the head clips at the same time.

This gracefully patterned handle with its convenient thumb and finger knob locks or releases both casements with an easy in-and-out motion.



Screens are unbelievably strong and light and frames do not encroach upon the glass opening. Frames are extruded aluminum bars 7/16 in. x 5/8 in. and are rewireable with 16-mesh, 32 gauge aluminum wire cloth. Corners of frame are solidly welded.

Frame has a wire brushed, satin finish, which will gradually acquire a soft gray patina, but may be painted to harmonize with any decorative scheme.

Specification clauses for screens and screened casement hardware applied to Master and Residence Casements will be found on pages 32 and 39. Similar clauses will cover screens applied to Custom-Built and Aluminum Casements.

Notice the clean profiles of the Lupton Screened Casement. The hardware does not project over the glass area at any point to mar the lines of the casements or window frame, whether opened or closed.

A touch on the terminal knob, of the Lupton Underscreen Operator, drawing the lever arm across the sill in a circular motion, opens the casement positively and easily. A half turn of the wing nut locks the window where wanted.

MASTER CASEMENTS

Master Casements are a new development. Sections are intermediate in weight between those of the Custom Built Casements and those of the Residence Casements, but specially designed to meet the architectural and structural requirements of the better grade buildings for which these windows are intended.

Master Casements are made in the familiar standard casement sizes and designs, illustrated on the following page.

Master Casements of standard design are equipped with the new type locking hardware described on preceding page and where screens are desired (as they usually are in residence work) the all aluminum screen and underscreen operator can be applied.

SPECIFICATIONS

Work Included

1. Furnish and install where shown on drawings Lupton Master Casements as manufactured by David Lupton's Sons Co., Phila., Pa.

Materials

2. All bars shall be rust resisting steel, hot rolled in one piece sections and free of hammer marks.

3. Frame members shall be equal leg sections and shall weigh not less than 1.7 lb./ft. Ventilator members shall weigh not less than 1.4 lb./ft.

Note:—Specify unequal leg section if desired for installation in masonry.

4. Horizontal and vertical mullions shall be T section specially shaped to form a wide contact with frame members of casements.

5. Muntins shall be T sections.

Construction

6. All casements shall be designed for outside putty glazing. Ventilators shall be side hinged or top hinged as indicated on elevations.

7. All casements shall be straight and true with members in alignment and surfaces in a plane.

8. Ventilator and frame members shall be mitered at corners and welded, and the resulting joint ground flush with members. The frame and ventilator shall form a continuous two point flat weathering contact.

9. Muntins shall be continuous between frame or ventilator members. They shall be tenoned and riveted to frame or ventilator members and shall have flush interlocking joints at intersections.

10. Provide Horizontal and Vertical Mullions and bolts for attaching where indicated on drawings.

11. Provide 16 gauge galvanized steel drip wherever a ventilator extends to the head of a casement, excepting when condition necessitates the use of a horizontal mullion bar, the mullion bar may be bent and used as a drip.

Note:—(a) Continuous anchors of 13 gauge steel are furnished if definitely specified, and mentioned in contract for windows.

(b) Anchor clips of 14 gauge steel for head, jambs and sill are furnished if specified.

Hardware

12. The following hardware (except hinges) shall be shipped unattached carefully packed to prevent damage. Hinges shall be attached and painted with the windows in the shop.

For Non-screened Casements specify:

Side hinged casements shall be equipped with locking latches (with lift action) special pull handle and extended friction hinges. Top hinged Transoms shall have locking latch for pole or hand operation and close up friction hinges.

For Screened Casements:

(See under "Screens")

Note:—Hardware is available in standard painted finish or in bronze with standard coin bronze and various special finishes. Specify the finish desired.

Shade and Drapery Brackets

13. All casements shall have holes provided for attaching drapery and shade brackets as indicated on window manufacturer's details.

Note:—Shade brackets are furnished if clearly specified and mentioned in contract for casements.

Calking Cement

(See page 3)

14. The window manufacturer shall furnish non-staining elastic calking cement (as indicated on window manufacturer's standard details) in quantities sufficient to make head, sill, jambs, mullions and imposts weathertight. Wooden filler-strips shall be furnished and used where indicated on details.

Erection

(See page 3)

15. All casements shall be erected in prepared openings by the window contractor (unless otherwise specified).

16. All Casements shall be set plumb and true, properly aligned and securely anchored before glazing. Mullions and imposts shall be bolted securely to frames. Calking cement and filler-strips shall be neatly applied at points indicated on window manufacturer's standard details.

Note:—Include in the masonry specifications that all masonry openings shall be accurately constructed in accordance with the installation details for Casements. All grouting, pointing, etc., should be done by the mason contractor after the windows are set.

Painting

16. All casements shall receive one shop coat of casement manufacturer's standard dark gray paint, oven dried.

Note:—(See page 3.)

Glass and Glazing

Note:—(See pages 3 and 5.) Specify glass and glazing under proper heading elsewhere in specifications.

(a) Do not specify single thickness glass.

(b) Specify high grade steel window putty (ordinary wood sash putty must not be used).

(c) Specify that Lupton Master Casements shall be glazed from the outside. The glass set in a bed of putty and held by Lupton Standard Wire Glazing Clips.

Screens

(Furnished if specified and mentioned in contract for windows.)

17. All Lupton Master Casements shall be equipped with screens designed to fit tightly against casement frame and prevent entrance of insects.

18. Screen frames shall be 7/8 x 5/8 in. extruded aluminum, solidly welded at corners to form a smooth seamless frame and with a wire brush, satin finish. Frames shall be rewireable.

19. Wire shall be 16 mesh, 32 gauge aluminum wire cloth.

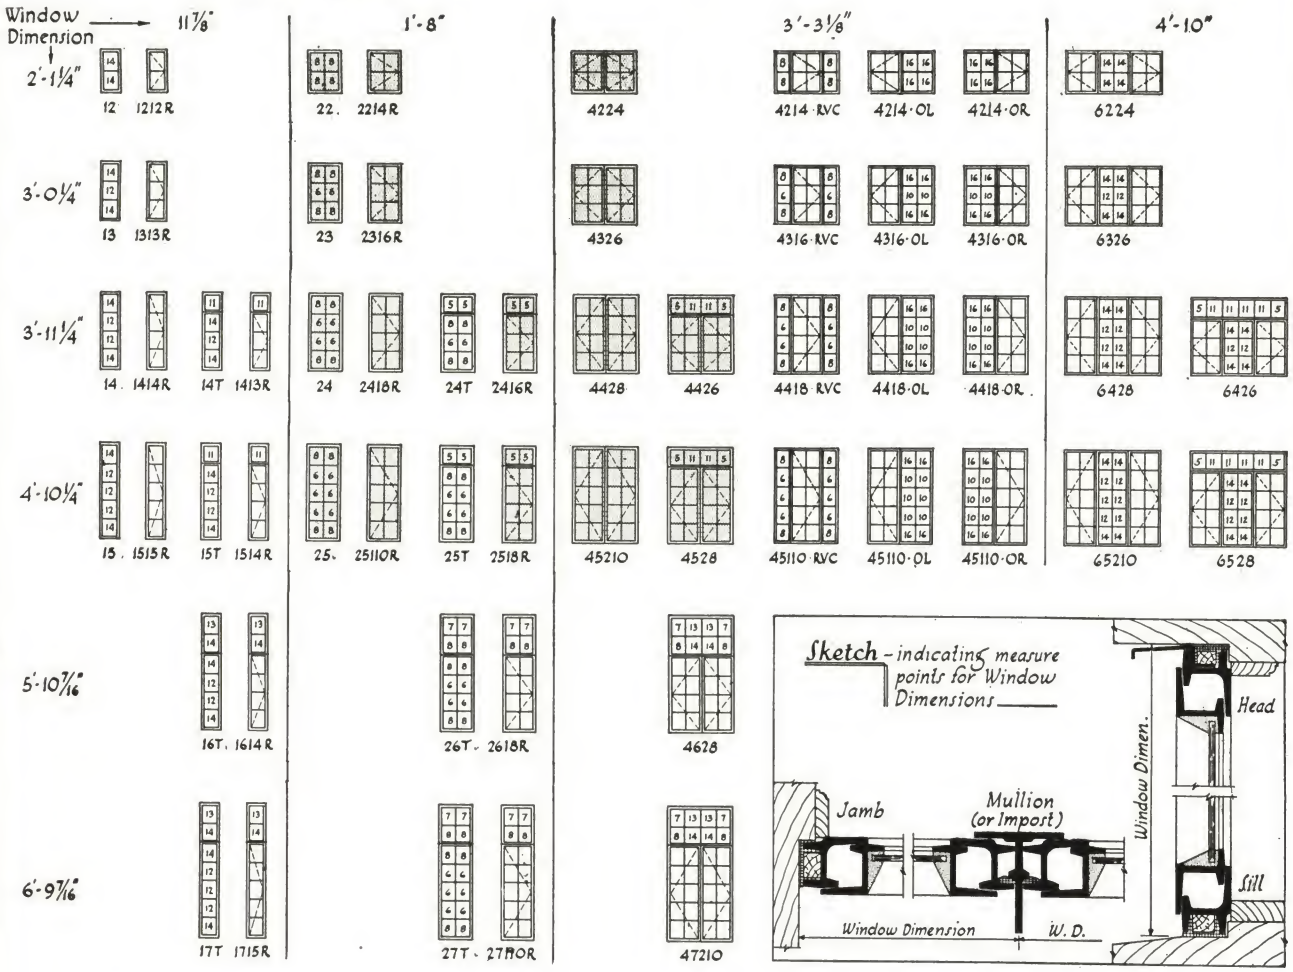
Note: When screens are specified the following hardware should be specified instead of that given above for non-screened Casements.

Hardware for Screened Casements

20. Side hinged casements shall have extended non-friction hinges and (one of the following):

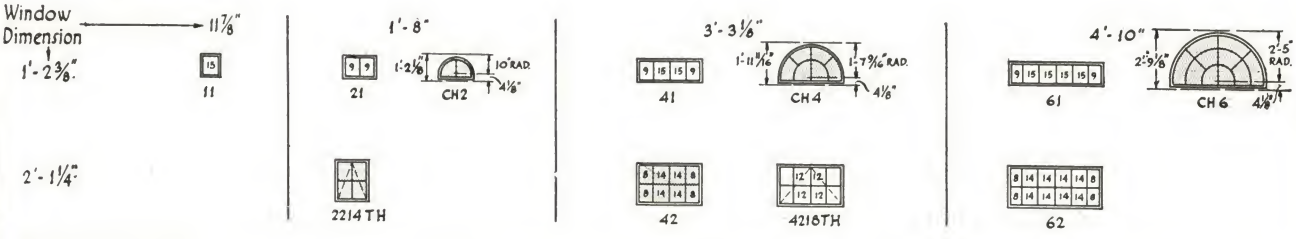
(a) Sliding type underscreen operator and standard locking latch (lift action).

(b) Windor series 50 operator and standard locking latch (lift action).



(c) Windor series 50 operator and Windor detachable locking handle (cam action).

21. Top hinged transoms shall have close up friction hinges and special underscreen operator and locking device for pole or hand operation.



If desired aluminum screens described above may be pivoted at the side to open in. In such cases the underscreen operator is eliminated and friction hinges are used. Hardware specification then becomes the same as for non-screened casements, paragraph 12.

Casements and Fixed Lights

Transom Units

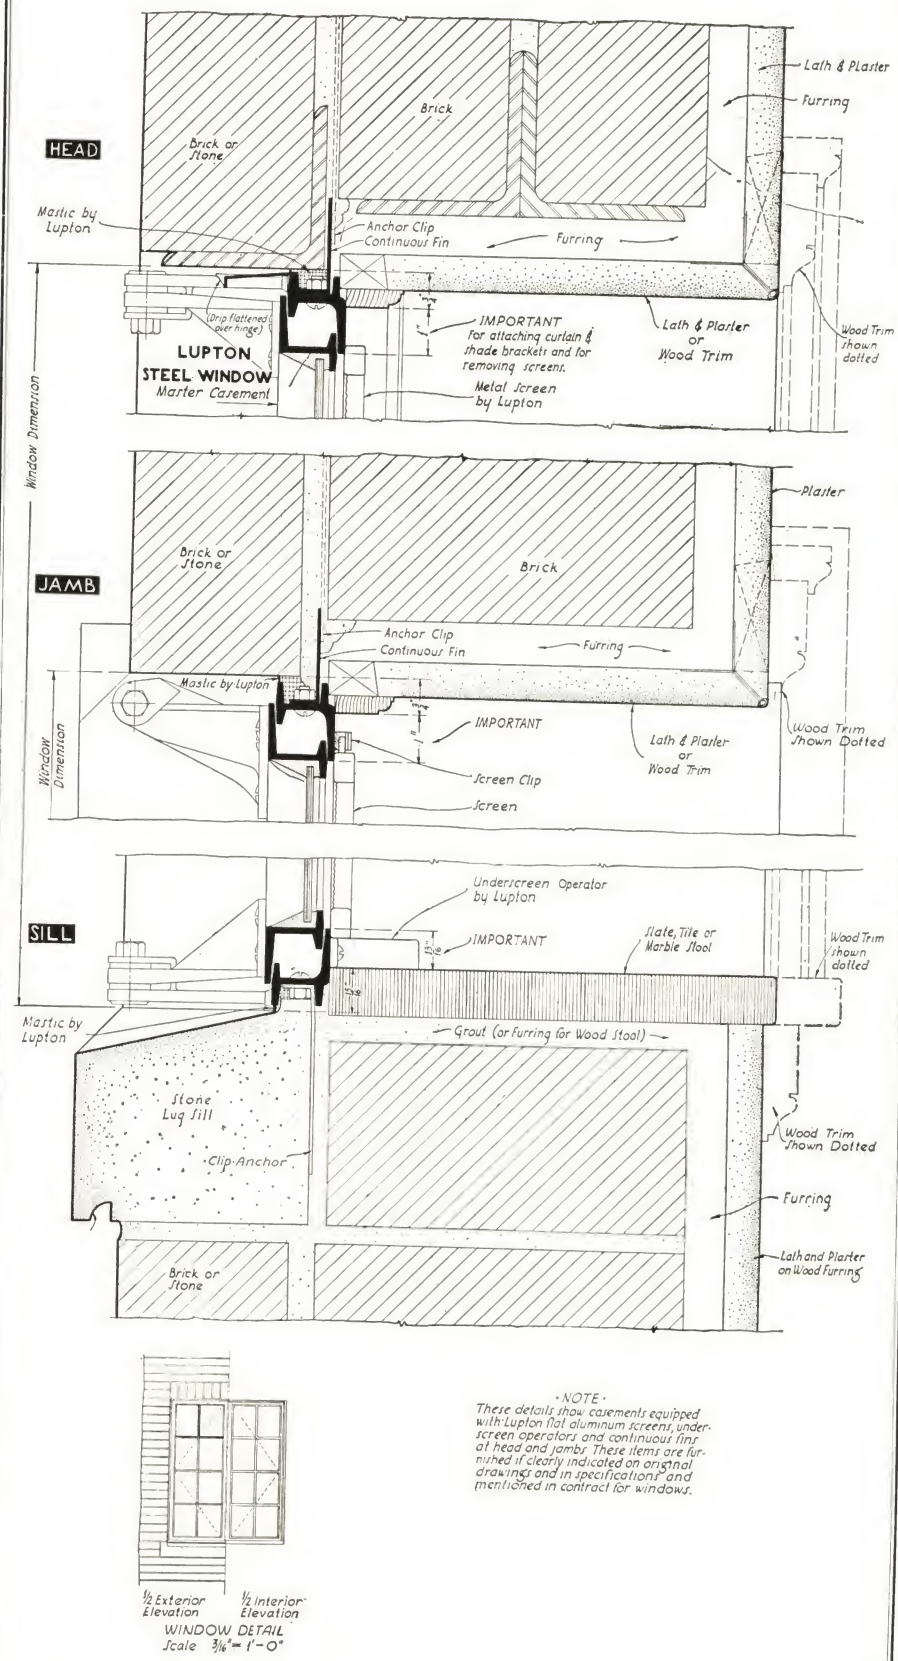
Notes

All elevations shown above are outside elevations. When viewed from outside right hand casements have hinges on the right and left hand casements have hinges on the left. Dotted lines on elevations indicate swing of casement thus: Single casements are made either right or left hand. Letter "R" denotes right hand. Where left hand casements are intended substitute letter "L" and reverse dotted lines.

Units shaded are Stock Types.

Right hand (2214 R)

Left hand (2214 L)



Top hinged (2214 TH)

Glass Sizes

For lights not numbered glass is 8" x 10⅝"
Numbered lights require glass of the following sizes:

5 - 8⅝" x 10"	11 - 9¼" x 10"
6 - 8⅝" x 10⅝"	12 - 9¼" x 10⅝"
7 - 8⅝" x 11"	13 - 9¼" x 11"
8 - 8⅝" x 11⅜"	14 - 9¼" x 11⅜"
9 - 8⅝" x 12"	15 - 9¼" x 12"
10 - 8⅞" x 10⅝"	16 - 8⅞" x 11⅜"

RESIDENCE CASEMENTS

The familiar standard casement for residence work with graceful, newly designed hardware and improved all aluminum screens that need not be opened to operate casements, but are quickly removed for cleaning glass without disturbing draperies.

Screens and hardware are illustrated on page 31. The underscreen operator and screens are optional but the locking latch is the same on all casements. Casements are drilled for shade and drapery brackets. See pages 41 and 44 for details.

SPECIFICATIONS

Work Included

1. Furnish where shown on drawings, Lupton Residence Casements as manufactured by David Lupton's Sons Co., Philadelphia, Pa.

Materials

2. Ventilator and frame members, muntins, and mullion and impost bars shall be made of specially rolled steel sections.

Construction

3. All casements shall be designed for outside putty glazing. Ventilators shall be side hinged or top hinged as indicated on elevations.

4. All casements shall be straight and true with members in alignment and surfaces in a plane.

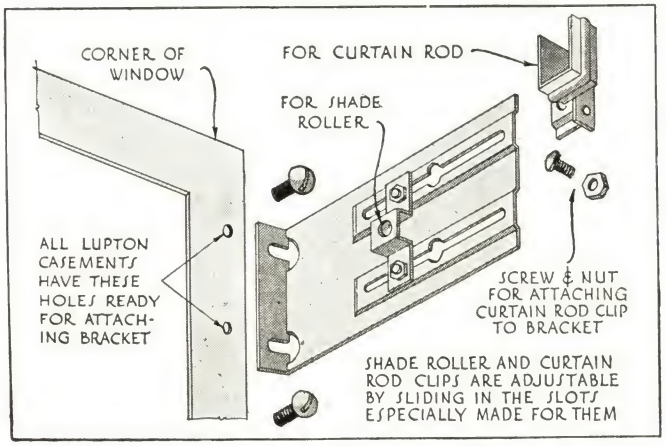
5. Ventilator and frame members shall be mitered at corners, butt welded and the resulting joint ground flush with members. The frame and ventilator shall form a two-point, flat, continuous, weathering contact.

6. Muntins shall be continuous between frame or ventilator members. They shall be tenoned and riveted to frame or ventilator members and shall have interlocking joints at intersections. They shall be flush with frame or ventilator members on the inside.

7. Provide Horizontal and Vertical Mullions and bolts for attaching where two or more units are required in an opening.

8. Weather bars shall be furnished for ventilators that extend to the head and shall be rolled as an integral part of the frame member at the head.

Note:—(a) Continuous anchors of 13 gauge steel are furnished if definitely specified, and mentioned in contract for windows.



(b) Anchor clips of 14 gauge steel for head, jambs and sill are furnished if specified.

Hardware

Note:—Hardware is available in standard painted finish or in bronze with standard coin bronze and various special finishes. Specify the finish desired.

9. The following hardware (except hinges) shall be shipped unattached carefully packed to prevent damage. Hinges shall be attached and painted with the windows in the factory. For nonscreened casements specify:

Side hinged casements shall be equipped with locking latches (with lift action), special pull handle and extended friction hinges.

All casements are drilled for attaching shade and drapery brackets as shown in detail at left. Brackets for simple or elaborate arrangements of draperies can be furnished if specified.

Top hinged Transoms shall have locking latch for pole or hand operation and close-up friction hinges.

For Screened Casements see under "Screens."

Shade and Drapery Brackets

10. All casements shall have holes provided for attaching drapery and shade brackets as indicated on window manufacturer's details.

Note:—Shade brackets are furnished if clearly specified and mentioned in contract for casements.

Calking Cement

11. The window manufacturer shall furnish non-staining elastic calking cement in quantities sufficient for application as shown on window manufacturer's standard details.

Erection

12. All casements shall be erected by (state by whom). They shall be set plumb and true, properly aligned and securely anchored before glazing. Mullions and imposts (and continuous anchors if specified) shall be bolted securely to frames. Calking cement shall be neatly applied at points indicated on window manufacturer's standard details. Attach hardware.

Note—Unless definitely stated otherwise in order or in specification, hardware will be attached by erector when casement is erected.

Note:—Include in the masonry specifications that all masonry openings shall be accurately constructed in accordance with the installation details for Casements. All grouting, pointing, etc., should be done by the mason contractor after the windows are set.

Painting

13. All casements shall receive one shop coat of casement manufacturer's standard dark gray paint, oven dried.

Note:—(See page 3.)

Glass and Glazing

Note—(See also pages 3 and 5.) Specify glass and glazing under proper heading elsewhere in specifications.

(a) Do not specify single thickness glass.

(b) Specify high grade steel window putty (ordinary wood sash putty must not be used).

(c) Specify that Lupton Residence Casement Windows shall be glazed from the outside. The glass set in a bed of putty and held by Lupton Standard Wire Glazing Clips.

Screens

(Furnished if specified and mentioned in contract for windows.)

14. All Lupton Residence Casements shall be equipped with screens, designed to fit tightly against casement frame and prevent entrance of insects.

15. Screen frame shall be $\frac{7}{8}$ x $\frac{5}{8}$ in. extruded aluminum, solidly welded at corners to form a smooth seamless frame, and with a wire brush, satin finish. Frames shall be rewireable.

16. Wire shall be 16 mesh, 32 gauge aluminum wire cloth.

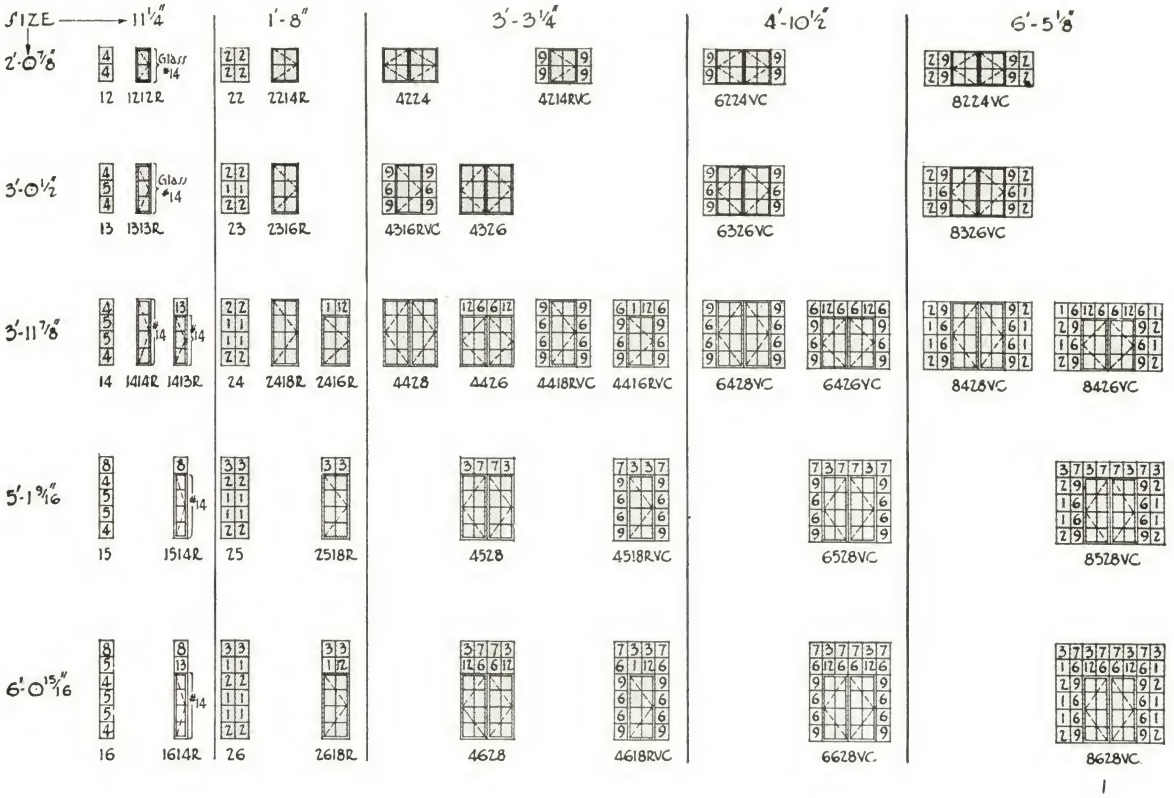
Note:—When screens are specified the following hardware should be specified instead of that given above for nonscreened casements.

Hardware for Screened Casements

17. Side hinged casements shall have extended non-friction hinges and (one of the following):

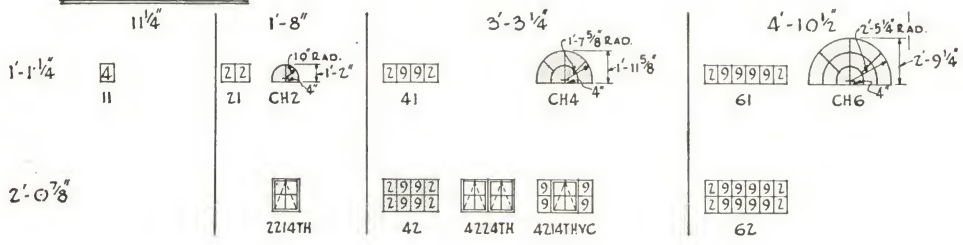
(a) Sliding type underscreen operators and standard locking latches (lift action).

(b) Windor series 50 operators and standard locking latches (lift action).



(c) Windor series 50 operator and Windor detachable locking handles (cam action).

18. Top hinged transoms shall have close-up friction hinges and special underscreen operators and locking device for pole or hand operation.



If desired aluminum screens described above may be pivoted at the side to open in. In such cases the underscreen operator is eliminated and friction hinges are used. Hardware specification then becomes the same as for non-screened casements, paragraph 9.

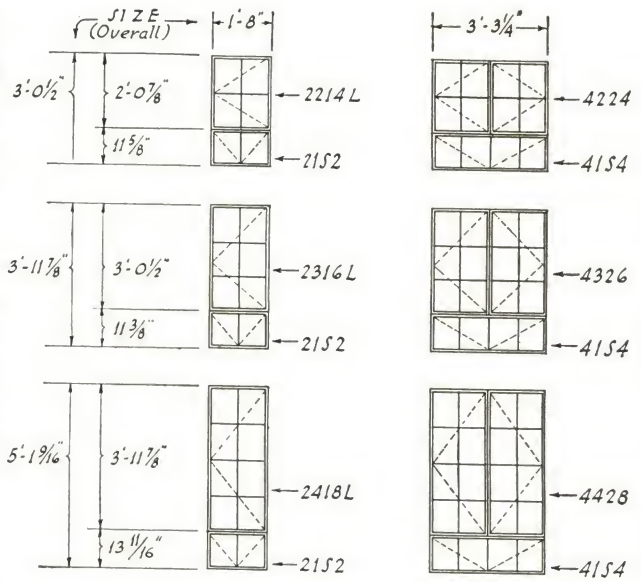
DETAILS OF SILL VENTILATORS

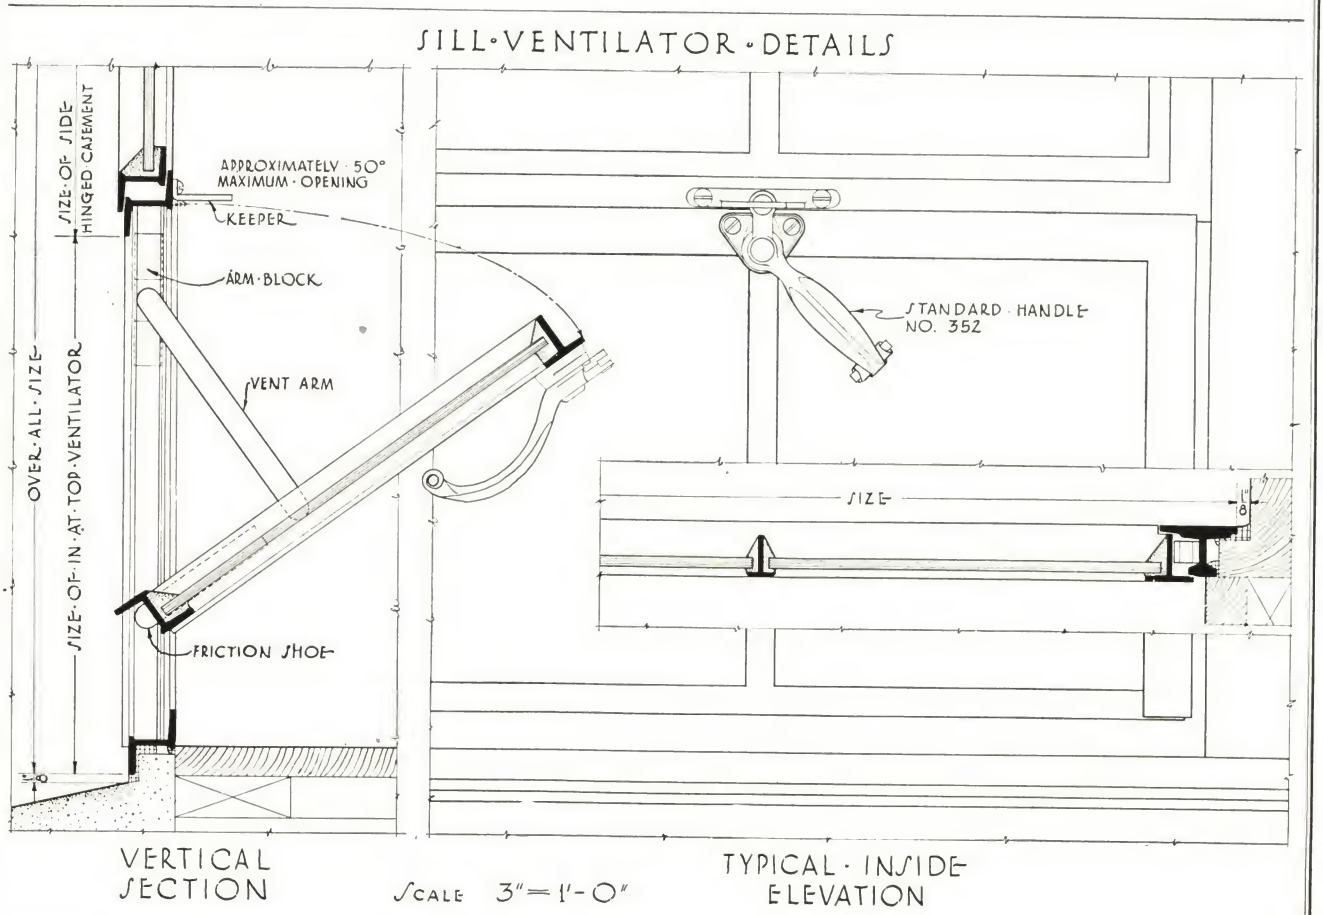
Scale for Details 3" = 1'0"



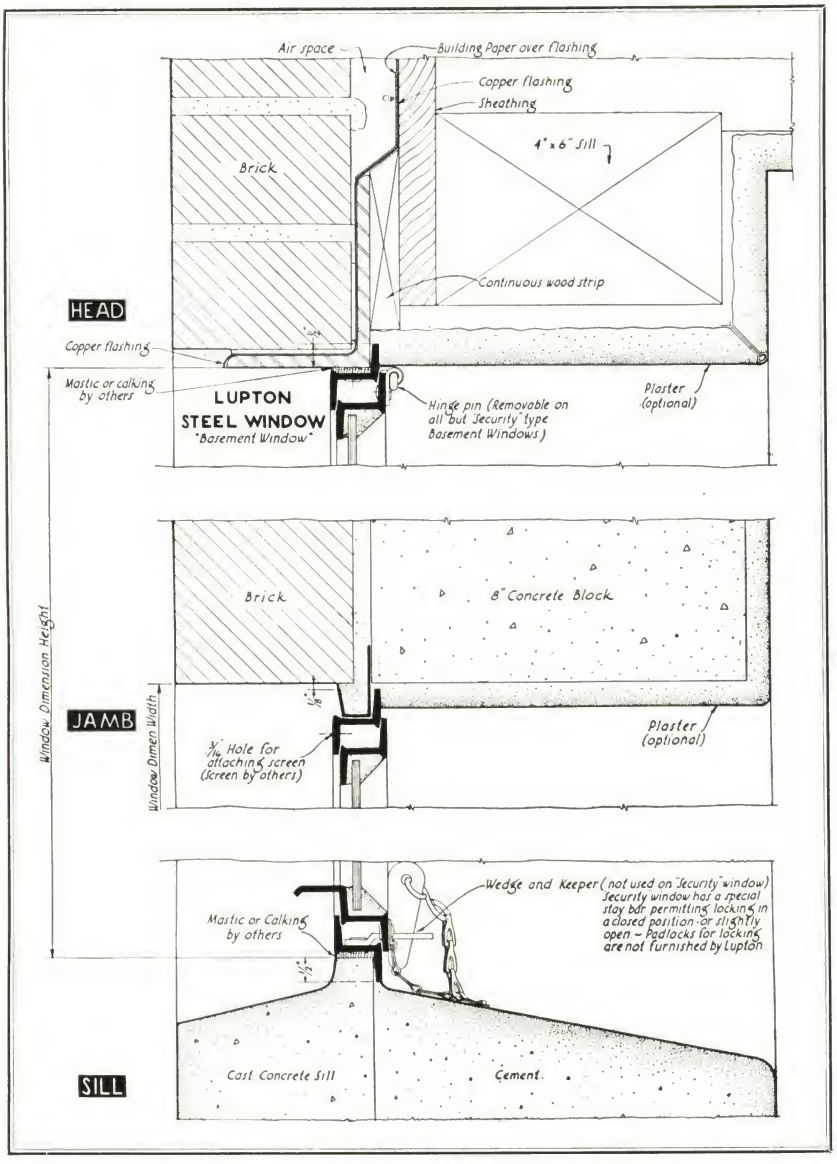
These optional ventilating units are suggested for use in rooms where a balanced outflow and inflow of air is desirable. With them a constant circulation of air can be maintained without draft at all seasons, providing in homes the same high standard of ventilation enjoyed in buildings equipped with Lupton Office Windows.

Sizes

Units as indicated in diagrams at right and on page 40 are made to fit under standard size Residence Casements and are attached before shipping. When units are required for six or eight light wide Casements or for use in composite windows with mullions, the entire window is assembled in the factory.



Screens

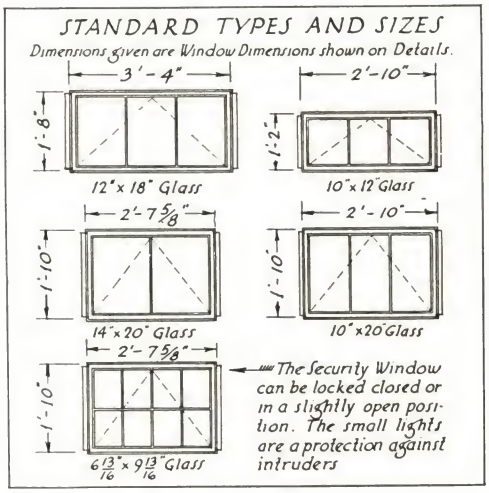


Provision is made for attaching a screen on the outside of the unit. Screen is of same construction as interior screens for casements described on page 39.

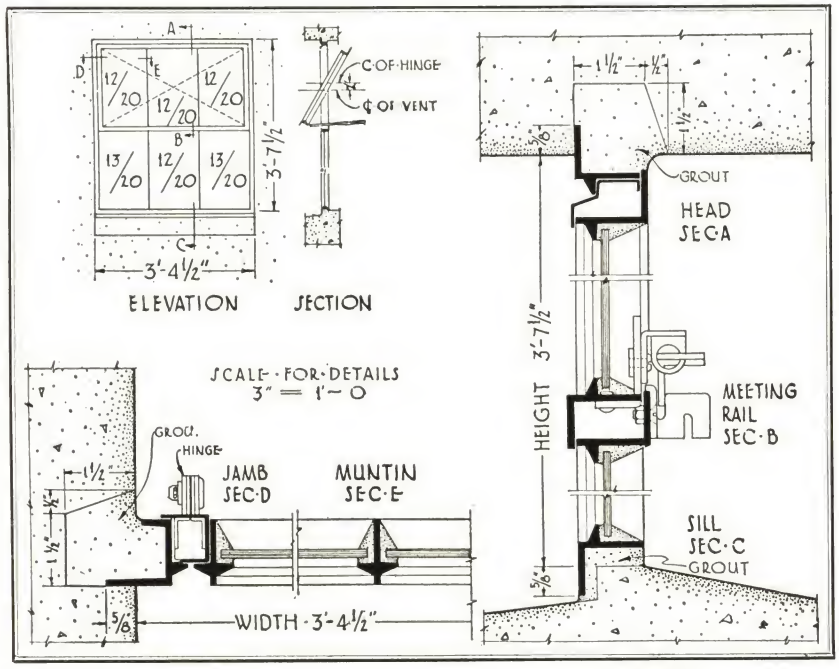
• OUTSIDE • ELEVATIONS •

Typical · Sill Ventilators shown in combination.. with typical Residence Casements. (See page 40)

BASEMENT WINDOWS



These windows give maximum light and ventilation and are carried in stock by Lupton Dealers. Made of the same steel sections as Lupton Residence Casements with welded corners and a bottom rail specially shaped to exclude moisture. Split hinge pins permit removal of ventilators from inside.



Security Type Window has small glass lights that keep out intruders. It can be locked closed or about 5 in. open. Hinge pins in Security Windows cannot be removed.

Provision is made for attaching screens.

Windows are painted gray and have steel locking pegs.

Padlocks are not furnished by Lupton.

UTILITY WINDOW

This window is designed to afford maximum light in small buildings, private garages and basements that are high above grade. The ventilator at the top of the window, swinging out at bottom and in at top, supplies fresh air without interfering with space requirements. Windows are glazed on the inside.

Ventilators are equipped with a standard angle-iron stay bar and holder (see page 73) for hand operation and are painted gray.

Angle shaped frame section permits easy installation in all types of wall construction. Illustration at left shows details of window set in a concrete wall.

GEORGIAN WINDOWS

Patent Applied For

Georgian Windows are gracefully patterned double hung, steel windows, low in cost and of universal adaptability for all types of buildings requiring double hung action windows.

The product of engineering research coupled with the assistance of experienced architects, these windows combine a high degree of mechanical perfection with a gracefulness of line and proportion reminiscent of the finely made windows of the Georgian era. Cost compares favorably with that of weatherstripped wood sash with fittings and attachment of hardware to make them comparable in completeness to the Georgian Window.

SPECIFICATIONS

Work Included

1. Furnish and install where shown on drawings steel double hung windows, "Georgian" type as manufactured by DAVID LUPTON'S SONS COMPANY, Philadelphia, Pa.

Materials

2. Frame and sash members shall be solid hot rolled steel sections. Parting strips and meeting rail weathering member shall be extruded aluminum. Sash members shall be not less than 1 in. in depth (front to back).

Construction

3. Windows shall be designed for outside putty glazing.

4. Frame and sash members shall be assembled with welded joints. Exposed welds shall be ground off flush with members.

5. Muntins shall be tenoned and riveted to sash members and shall have flush interlocking joints at intersections.

6. Windows shall be made so that when closed and locked, sash are forced into positive continuous contact with frame at head and sill, with parting strip at jambs and with each other at meeting rail. Contact at meeting rail shall be thru an aluminum strip and resilient cushion attached to the top sash. Wedge blocks shall be provided on jambs at ends of meeting rails to prevent air leakage at these points.

7. When window is closed the distance between masonry and glass sight line at head and jambs, and the distance from top of stool to sight line at sill shall not exceed 1⅛ in. Width of meeting rail between sight lines shall not exceed 1 in.

8. The sash shall be hung on spring balances (two for each sash). Balances shall be encased in housings, one housing securely riveted to each jamb and joints calked to prevent entrance of moisture when set in masonry. Balances shall be removable.

9. Attachment of spring balance tapes to sash shall be at bottom rail, by means of specially designed tape staples and sash clips, and in such manner that tape (including tape staple) hangs vertically. Clips shall be securely attached to bottom rails with screws easily accessible.

10. Strap anchors shall be furnished for head, jambs and sill.

Hardware

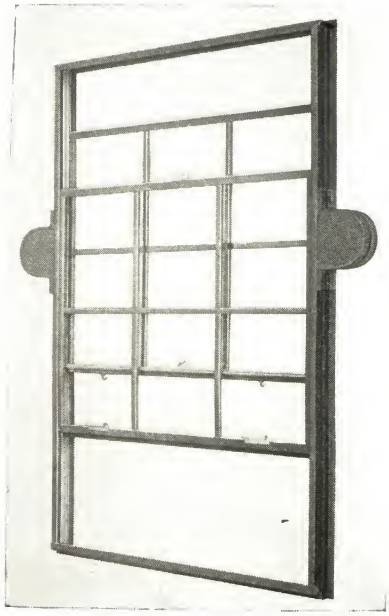
11. Spring balances shall be provided, fitted with bronze tapes not less than .016 inches thick and tape staples for attaching to sash. Staples shall have a hole for attaching a guide wire.

12. Tension in balances shall be adjustable without removing balances.

13. Malleable iron pull down hooks shall be attached to bottom rail of top sash and a malleable iron cam lock shall be attached at meeting rail.

14. A pair of extruded aluminum sash lifts shall be provided for each window, shipped unattached.

Continued on next page.



←*At Left*

Finger-tip lightness in operation is achieved by the use of high-grade spring balances and by the unique Lupton system of factory-established clearances between the sash and the frame. Note also the extraordinary clear light opening, narrow meeting rail, and inconspicuous frame members, resulting from the use of special rolled sections. These windows reproduce with extraordinary fidelity the architectural character of the fine original windows of the Georgian era.

At Right→

Georgian Windows are shipped complete and ready to install. Metal wedges firmly hold upper and lower sash in positions indicated. All four rails act as rigid braces, strengthening frame in shipment and handling.

Continued from preceding page.

SPECIFICATIONS

Erection

Note:—The Georgian Window is shipped assembled with jamb members braced at four points between head and sill to prevent bending. Bracing should remain in place until time for glazing.

Windows should be firmly braced in position and the walls built around them enclosing the anchors and balance housings. In frame construction the bucks must be set far enough apart to clear the housings. See details on pages 51 and 52.

15. Windows shall be set in place securely braced plumb and level. In building the walls, proper clearances shall be maintained as shown on window installation details.

16. After glazing sash, lifts shall be attached and spring balances adjusted.

Calking

Note:—Calking is not done by Lupton, but when specified and mentioned in window contract non-staining elastic calking cement will be furnished. See page 3.

Painting

17. Windows shall receive one shop coat of window manufacturer's standard gray paint, oven dried.

Glass and Glazing

Note:—(See also page 3.) Specify glass and glazing under proper heading elsewhere in specifications.

(a) Do not specify single thickness glass. Specify double thick or ⅛" plate glass. Heavier glass is not recommended as the total weight may exceed the capacity of the spring balances.

(b) Specify high grade steel window putty (ordinary wood sash putty must not be used).

(c) Specify that Lupton Georgian Windows shall be glazed from the outside. The glass set in a bed of putty and held by Lupton standard wire glazing clips.

MASTER OFFICE WINDOWS *and* MASTER PROJECTED WINDOWS

Newly designed, high grade windows in standard sizes at moderate cost for use in offices, school class rooms, or wherever natural ventilation is desired with maximum protection from draft. Office windows combine casements and sill ventilators. Projected windows have ventilators opening in or out with bottom or top suspension.

SPECIFICATIONS

Work Included

1. Furnish and install where shown on drawings Lupton Master Office Windows (or Master Projected Windows) as manufactured by David Lupton's Sons Company, Philadelphia, Pa.

Materials

2. All bars shall be rust resisting steel.

3. Frame members shall be unequal leg sections.

4. Weight per ft. of bars shall not be less than the following: frame for fixed lights—1.8 lb. per ft., frame for ventilators 2.9 lb. per ft., ventilator member 1.4 lb. per ft., muntins .79 lb. per ft. and mullion bars 2.8 lb. per ft.

Construction

5. All windows shall be designed for outside putty glazing. Ventilators shall be side hinged or have projected movement to open in at top or out at bottom as indicated on elevations.

6. Ventilator members shall be mitered at corners and welded. Frame members shall be tenoned and riveted. Where face welding occurs, weld shall be ground flush with members.

7. All members shall be true and straight, forming a continuous, two point, flat weathering contact between ventilator and frame.

8. Horizontal and vertical muntins, where they occur, shall be continuous with flush interlocking joints at intersections and shall be tenoned and riveted to frame or ventilator members.

9. Provide Horizontal and Vertical mullion bars and bolts for attaching where indicated on drawings.

10. Provide a 16 gauge galvanized steel drip wherever a side hinged ventilator extends to the head of a unit excepting where condition necessitates the use of a horizontal mullion bar the mullion bar may be bent and used as a drip.

11. Provide anchor clips of 14 gauge steel for anchoring at head jambs and sill.

Note:—Continuous anchors of 13 gauge steel are furnished if definitely specified and indicated on drawings.

Hardware

12. All side hinged ventilators shall have extended type malleable iron friction hinges to open 90° and allow outside of glass to be washed from inside the building.

13. All ventilators opening in at top or out at bottom shall be pivoted on two steel arms attached to the jamb frame members. Ventilators shall be equipped with two bronze adjustable friction shoes sliding in the frame member so as to hold the ventilator firmly in an open position without use of fasteners or adjusters.

14. Side hinged ventilators shall have locking handles (cam action). Where ventilators are over 4 ft. in height, an auxiliary latch shall be used, connected to the locking handle by a ½ in. steel tube.

15. Open in at top and open out at bottom ventilators shall have cam action locking handles. Ring type handles shall be used on ventilators beyond reach from floor.

Note:—Hardware is available in standard painted finish or in bronze with standard coin bronze or special finishes. Specify the finish desired.

Calking Cement

16. The window manufacturer shall furnish non-staining elastic calking cement (as indicated on window manufacturer's standard details) in quantities sufficient to make head, sill, jambs, mullions and imposts weathertight. Wooden filler-strips shall be furnished and used where indicated on details. *(See page 3.)*

Erection

17. All Office and Projected Windows shall be erected in prepared openings by the window contractor (unless otherwise specified).

18. All Windows shall be set plumb and true, properly aligned and securely anchored before glazing. Mullions and imposts shall be bolted securely to frames. Calking cement and filler-strips shall be neatly applied at points indicated on window manufacturer's standard details.

Note:—Include in the masonry specifications that all masonry openings shall be accurately constructed in accordance with the installation details for Office and Projected Windows. All grouting, pointing, etc., should be done by the mason contractor after the windows are set.

Painting

19. All windows shall receive one shop coat of window manufacturer's standard dark gray paint, oven dried. *(See page 3.)*

Glass and Glazing

Note:—(See also pages 3 and 5.) Specify glass and glazing under proper heading elsewhere in specifications.

(a) Do not specify single thickness glass.

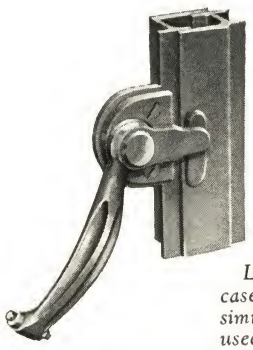
(b) Specify high grade steel window putty (ordinary wood sash putty must not be used).

(c) Specify that Lupton Master Office and Projected Windows shall be glazed from the outside. The glass set in a bed of putty and held by Lupton glazing wedges.

Screens

(Furnished if specified and mentioned in contract for windows.)

20. Master Office and Projected Windows shall be equipped with screens designed to fit tightly against window frame and prevent entrance of insects.



21. Screen frames shall be $\frac{7}{16}$ x $\frac{5}{8}$ in. extruded aluminum, solidly welded at corners to form a smooth seamless frame, and shall have a wire brush, satin finish. Frames shall be rewireable.

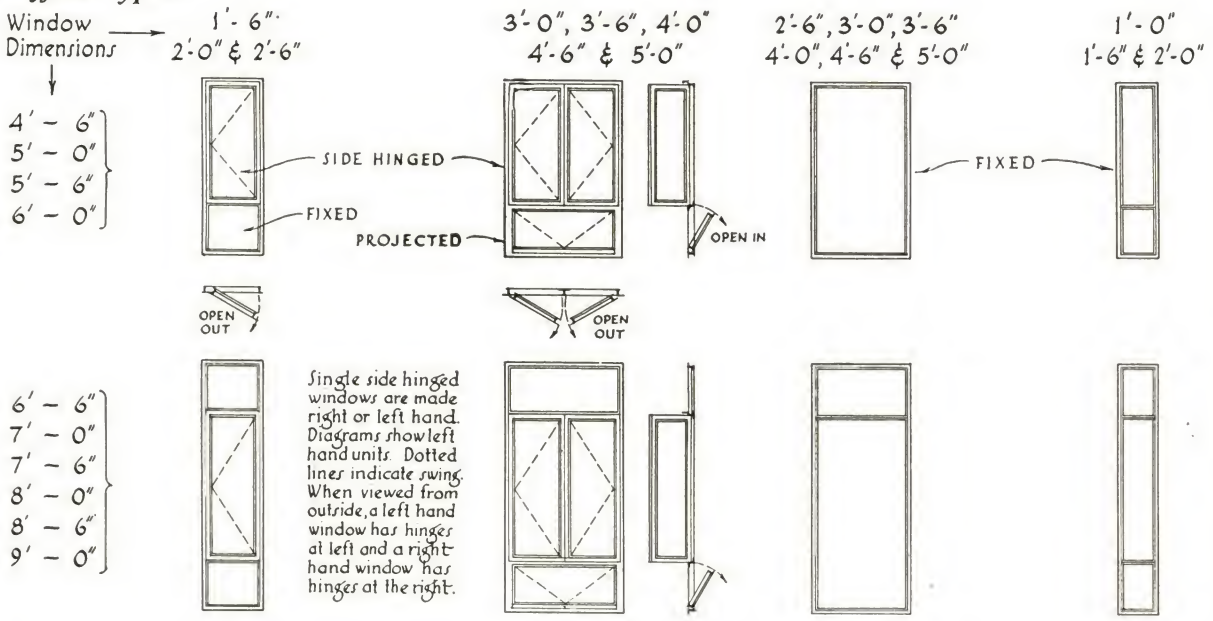
22. Wire shall be 16 mesh, 32 gauge aluminum wire cloth.

Note:—When screens are specified the following should be inserted in the above specification under "Hardware." The special hardware is similar to that used for Master Casements.

23. Screened Side Hinged Casements shall be provided with special locking hardware and underscreen operators to permit operation and locking of ventilators without opening screens.

HARDWARE

Left—locking handle for side hinged casements. A double locking device similar to the one shown on page 8 is used for casements over 5'0" high.



Above—locking handle for open out at bottom ventilators and (at right) locking handle for open in at top ventilators. Beyond reach from floor ring type handles are used for pole operation.

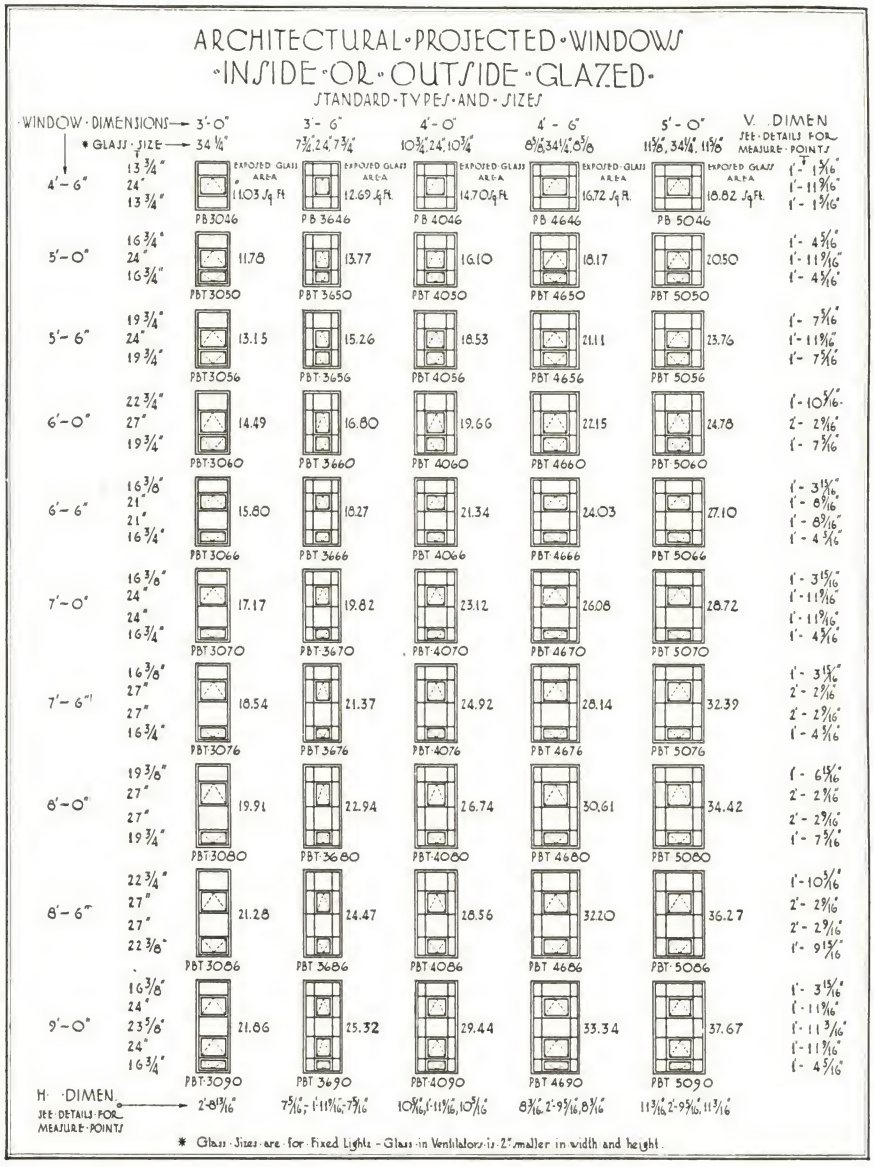
MASTER OFFICE and PROJECTED WINDOWS
FULL SIZE SECTIONS



ARCHITECTURAL PROJECTED WINDOWS

Some buildings, or parts of buildings, because of limits in cost or because of other restrictions, will not permit the use of the casement windows previously described.

In such cases, Lupton Architectural Projected Windows, made of medium weight sections, will often fill the requirements of good ventilation and lighting with entire satisfaction.

Standard sizes and designs are shown in diagram at right. Window dimensions, glass sizes, and wall details are the same for both inside and outside glazed windows.

SPECIFICATIONS

Work Included

1. Furnish and install where shown on drawings, Lupton Steel Architectural Projected Windows, manufactured by David Lupton's Sons Co., Philadelphia, Pa.

Materials

2. Frame members shall be heavy, specially designed, solid steel, unequal leg channel sections.

3. Ventilator members shall be specially designed, solid steel angle sections.

4. Muntins shall be specially designed, solid steel cruciform section 1⅜ in. deep.

5. Vertical mullions shall be formed steel plate.

Note:—Structural steel members forming Imposts are not furnished by the window manufacturer.

Construction

6. Windows shall be designed for outside glazing (*or specify:* windows shall be designed for inside glazing with glazing angles).

7. Both Frames and Ventilators shall be assembled by tenoned, riveted and welded joints at the corners. Continuous, two-point flat contact weathering shall be provided between ventilators and frames.

8. Muntin Bars shall be attached to frame members by tenoned, riveted joints and shall be interlocked at their intersections.

SPECIFICATIONS

9. Vertical Mullions and bolts for attachment shall be provided where two or more windows are placed side by side in an opening.

10. Anchor Clips of 13 gauge steel for jambs, sill and head shall be furnished and applied in field.

11. Each ventilator shall be accurately pivoted on two ventilator arms of solid steel. The connections between the ventilator arms and the window frames shall be made by steel arm blocks.

12. Each ventilator shall be equipped with two brass friction shoes, sliding vertically in the ventilator jambs to guide the ventilator and prevent rattling. Each shoe shall be equipped with a rustproofed, flat steel spring attached to the ventilator to assure constant pressure at the jambs.

13. An angle clip 1 5/8 in. x 1 in., 2 in. long shall be riveted to the ventilator frame to provide for attaching locking handle.

14. All windows shall be drilled as indicated on window manufacturer's details for attaching shade brackets.

(See note at end of specification.)

Glass and Glazing

Note:—(See page 3.) Specify glass and glazing under proper heading elsewhere in specifications.

(a) Do not specify single thickness glass.

(b) Specify a high-grade steel window putty (ordinary wood sash putty must not be used).

(c) Specify that Lupton Architectural Projected Windows shall be glazed from the outside, the glass shall be set in a bed of putty, and held by Lupton standard wire glazing clips.

or (d) Specify that Lupton Architectural Projected Windows shall be glazed from the inside, the glass shall be set in a bed of putty and held by continuous glazing stops.

Note

When clearly indicated in original specifications and drawings and mentioned in contract for windows, the following items will be furnished.

(a) Screens (b) Shade brackets (c) Non-staining elastic calking cement for head, jambs and sill. (d) Application of calking cement (if windows are erected by Lupton) at time of erection.

Hardware

15. All locking handles shall be solid bronze, highly polished. *(or specify:* All locking handles shall be solid bronze with natural bronze finish.)

16. Hardware (described below) shall be shipped unattached carefully packed to prevent damage until applied.

17. Provide cam action locking handles for open in and open out ventilators within reach from floor.

Provide ring type cam action locking handles and pull down rings for open out ventilators beyond reach from floor.

Screens

See note at end of specification. If screens are desired, specify:

18. All windows shall be fitted with screens, attached to the frames of the ventilators so as to prevent entrance of insects. Screen frames shall be 7/16 in. x 1 in. formed galvanized steel tubing, reinforced and welded at corners, and shall be rewireable. Wire shall be 16 mesh bronze wire cloth. Frames shall be painted same color as windows.

Erection

19. All Architectural Projected Windows shall be erected in prepared openings by the window contractor unless otherwise specified.

(See page 3)

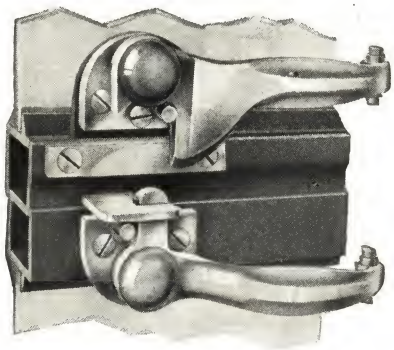
20. All Architectural Projected Windows shall be set plumb and true, properly aligned and securely anchored before glazing. Mullions shall be bolted securely to Frames.

Note:—Include in the masonry specification that all masonry openings shall be accurately constructed in accordance with the installation details for Architectural Projected Windows. All grouting, pointing, etc., should be done by the mason contractor after the windows are set.

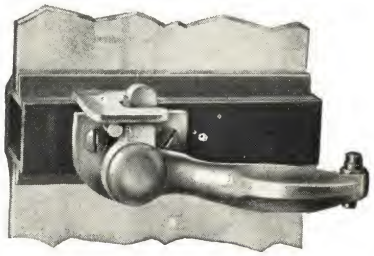
Calking

(See page 3 and note at end of specification.)

Painting



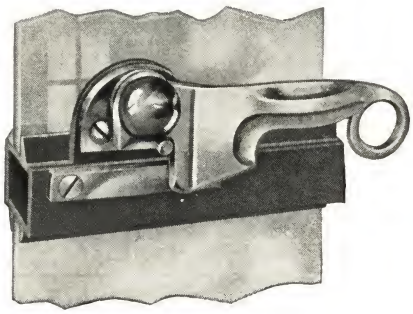
21. All Architectural Projected Windows shall receive one shop coat of window manufacturer's standard dark gray paint, oven dried.



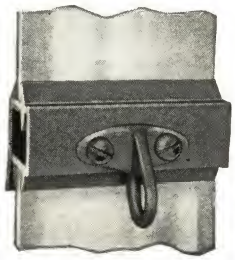
Note:—(See page 3.)

HARDWARE

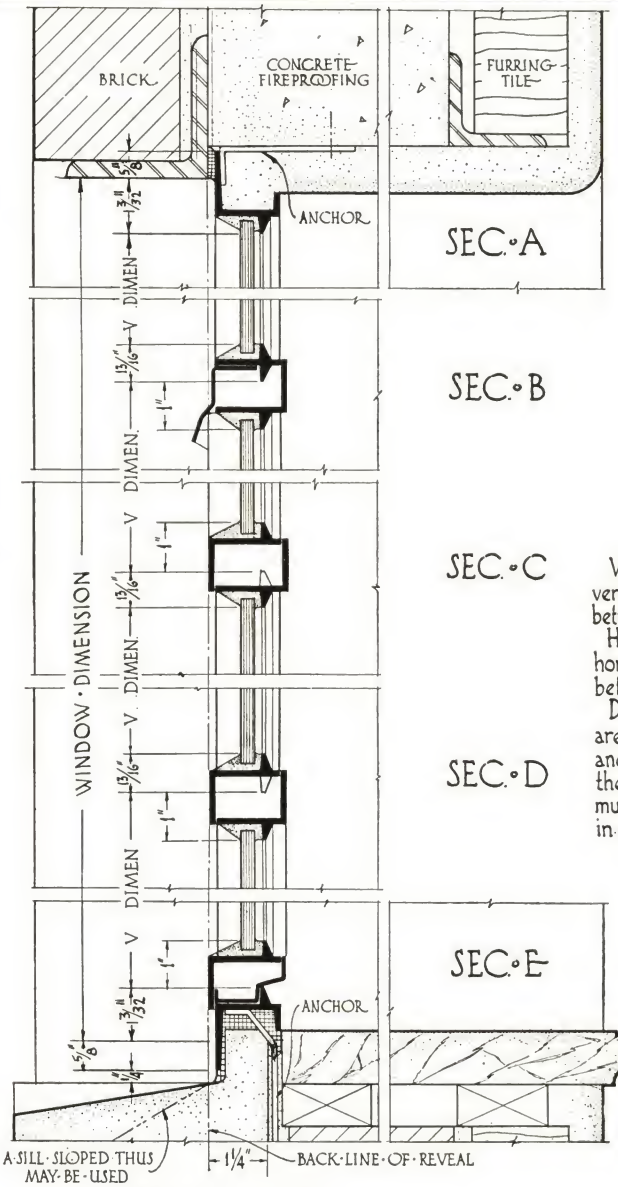
Hardware is solid bronze with highly polished or natural finish as specified.



Two locking handles are shown at right mounted on the meeting rail between an open out and an open in ventilator. Upper handle, No. 268, is used on all open out at bottom ventilators within reach from floor. Lower handle is No. 266.



Locking handle No. 266 (shown at right) is used on ventilators opening in-at-top.



Below at right is ring type locking handle No. 328 used on open-out-at-bottom ventilators beyond reach from floor. A pull down ring No. 358 (shown below) mounted on the top rail of the ventilator is used in conjunction with this handle for pole operation.

DOUBLE HUNG WINDOWS « TYPES G *and* H

Patent Number 1,802,717

A double hung action window with a fundamentally new principle in design eliminating the usual disadvantages of plate type metal double hung windows. There can be no lateral movement or side play, yet the sash are unbelievably easy to operate due to the use of ball bearing rollers.

Infiltration is reduced by an improved weight box and by weatherstripping on all sides and at meeting rail. Windows are made in fifty standard sizes ranging from 3 ft. 0 in. x 4 ft. 6 in. to 5 ft. 0 in. x 9 ft. 0 in., the same as the Double Hung Windows Types E and F described on page 66.

SPECIFICATIONS

Work Included

1. Furnish and install where shown on drawings, Lupton Steel Double Hung Windows (Type G or H as desired) manufactured by DAVID LUPTON'S SONS CO., Philadelphia, Pa.

Materials

2. Sash members shall be cold galvanized strip steel. Frame members shall be hot galvanized dull coated sheet steel.

3. Members shall be of the following thickness:

Frame members for Type G, head and head cover 20 gauge, sill 16 gauge, jamb 20 gauge and 16 gauge combined.

Frame members for Type H, head 16 gauge, head cover 20 gauge, sill 13 gauge, jamb 16 gauge and 14 gauge combined.

Sash members (for G and H types) 14 gauge (12 gauge for windows over 4 ft. wide), muntin 16 gauge, glazing strips 14 gauge (12 gauge for bottom rail of lower sash).

Construction

4. Windows shall be designed for inside glazing with glazing strips.

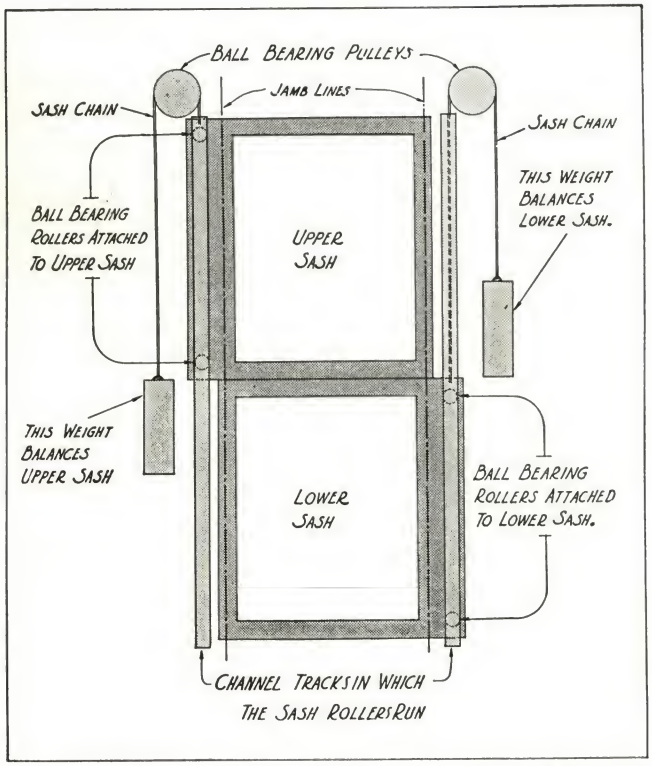

Diagram elevation of window illustrating method of balancing each sash with a single weight attached at one side. Sideplay is prevented by the ball bearing sash rollers which run in a steel channel track.

5. Sash members shall be mitered and arc welded at corners. Muntins shall be spot welded to sash members and at intersections. Frame members shall be arc welded at corners.

6. Sash shall have flanges to enter grooves at head and jambs and to make wide, overlapping contact at sill.

7. Each sash shall be balanced by a weight attached to one side of the sash with a galvanized steel sash chain (No. 113 American Chain Co., 1000 lbs. ultimate strength in tension) passing over a ball bearing steel pulley.

8. Each sash shall be equipped with two ball bearing rollers mounted one at the top and one at the bottom of the flange on the side to which the sash weight is attached. A 13-gauge steel channel track shall be fastened inside the weight box. The rollers shall run smoothly in this track so as to eliminate binding and sideplay or lateral movement of the sash.

9. The flange on the side of the sash opposite the rollers shall be guided by a groove in the face of, but having no opening into the interior of, the weight box.

10. Sash shall be equipped with safety stop to prevent dropping of sash if weight is detached.

11. Weather stripping of nickel silver shall be furnished for meeting rail, sill and jambs. Felt weather stripping shall be furnished at head.

Note:—Where specified, nickel silver will be substituted for felt weathering at the head. See note B, next page.

Hardware

12. Meeting rail lock and pull-down grip of malleable iron, cold galvanized shall be furnished, shipped unattached. Stamped steel pull-down socket for pole operation shall be welded to sash rail. Glazing strips of lower sash shall be formed with a flange to serve as a sash lift.

Note:—If specified the following can be furnished: Pull down handle (substituted for pull down grip) bronze sash lift grips, drop forged pull down socket, bar type lift handles for lower sash, hardware of polished solid bronze. (See note B, next page.)

Erection and Painting

Note:—See page 3 for general information on calking, painting and erection. See also note B, next page. Lupton Double Hung Windows (Types G and H) are shipped assembled. The chain is fastened inside the weight box, and the sash weights are shipped unattached.

13. All windows shall be erected in prepared openings by the window contractor. They shall be set plumb and true, securely fastened in place and counterweighting properly adjusted after glazing.

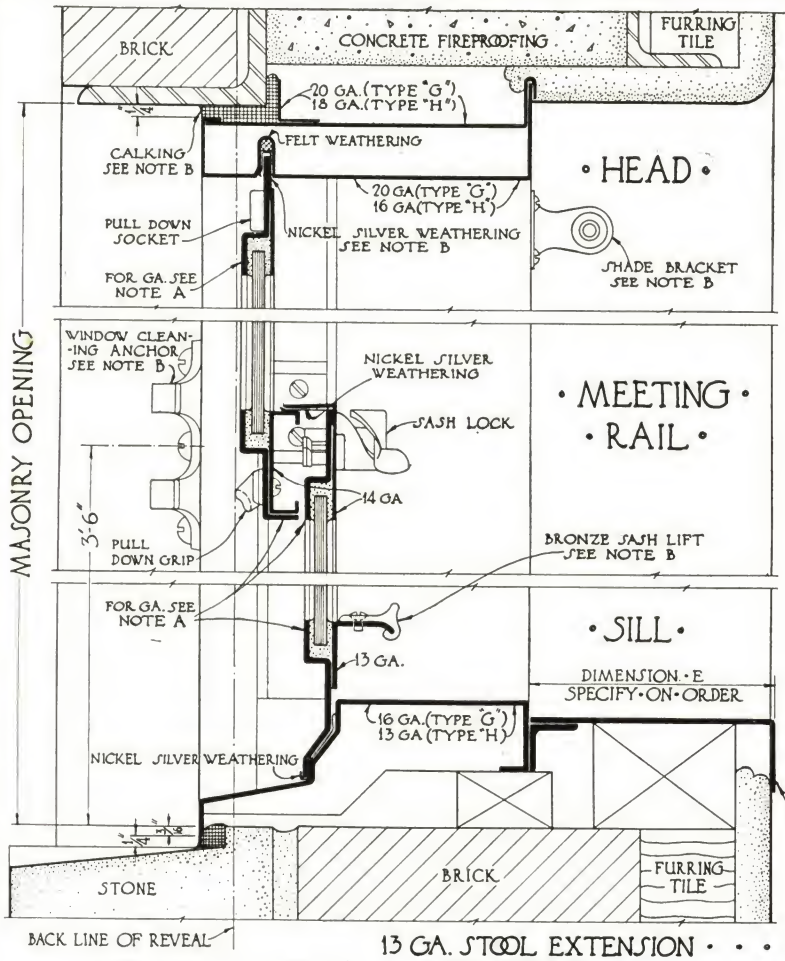
Note:—Include in the masonry specification that all masonry openings shall be accurately constructed in accordance with the installation details for Lupton Double Hung Windows (Types G and H) and that all mortar, grouting, pointing, etc., shall be performed under other specifications after windows have been erected.

14. All windows shall receive one coat of window manufacturer's standard gray galvanized metal primer before leaving factory.

Glass and Glazing

Note:—(See page 3.) Specify glass and glazing under proper heading elsewhere in specifications.

(a) Do not specify single thickness glass.



(b) Specify high-grade steel window putty (ordinary wood sash putty should not be used).

(c) Specify that all Lupton Steel Double Hung Windows shall be glazed from the inside; that all glass shall be set in a bed of putty and held by glazing strips.

DOUBLE HUNG WINDOWS « TYPES E *and* F

Double hung window types E and F described here are designed to meet the underwriters' requirements and are recommended for use in locations where a labelled window is needed. Where it is not necessary to have labelled windows, the Georgian Window (described on pages 48 to 53) or the Types G and H Window (described on pages 64 and 65) are recommended.

Types E and F double hung windows are similar in construction, but type F is made of slightly heavier materials. Both types may receive underwriters' labels subject to the following limitations. Maximum size of unit is 6 ft. wide and 10 ft. high. Mullions must be anchored at head and sill. Maximum exposed glass area is 720 sq. in. and not over 48 in. wide or 54 in. high. Sash locks must be malleable iron. Weather-stripping is optional.

When ordering labelled windows it is important to state the number and sizes of units in each masonry opening, and show the wall details at head, jamb and sill, as this information is required before the windows can be labelled.

SPECIFICATIONS

Work Included

1. Furnish and install where shown on drawings, Lupton Steel Double Hung Windows manufactured by David Lupton's Sons Co., Philadelphia, Pa.

Materials

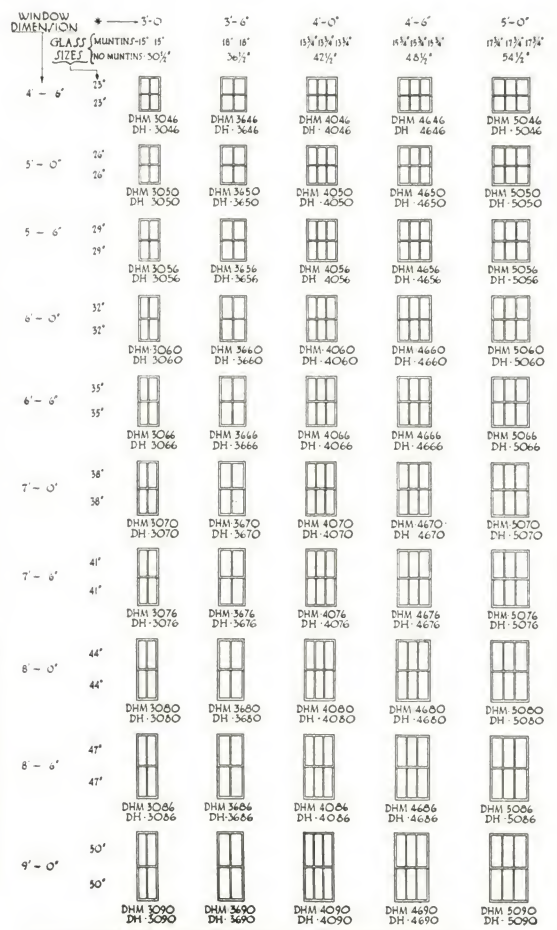
2. Sash members and parting strips shall be cold galvanized strip steel. Frame members shall be hot galvanized, dull coated sheet steel.

3. Members shall be of the following thicknesses: Sash members 14 gauge (12 gauge for windows over 4 ft. wide), muntins 16 gauge, glazing strips 14 gauge (12 gauge for bottom rail of lower sash), parting strips 16 gauge, frame members for type E—20 gauge, except sill which shall be 16 gauge, frame members for type F—head 16 gauge, head cover 18 gauge, jamb box 14 gauge, removable piece 16 gauge, sill 13 gauge.

Construction

4. Windows shall be designed for inside glazing. Glazing strips shall be provided, attached with low round head machine screws.

5. Sash members shall be mitered and arc welded at corners. Muntins shall be spot welded to frame members and at intersections. Frame members shall be arc welded at corners.



6. Sash shall be designed with a flange to enter grooves at head and jamb and to make double contact with sill member. Head (exclusive of cover) and sill shall each be made of one piece. Jamb shall be designed with a removable piece for access to weights. Weights shall be separated by a division strip.

7. Weather stripping of 22 gauge steel, galvanized, shall be furnished for the jambs and a sponge-rubber weather-strip shall be furnished at sill.

Note:—Additional spring bronze weathering can be furnished (see note B next page).

SIZES AND TYPES

Note: Diagram shows windows with muntins. In writing the catalogue numbers DHM indicates windows with muntins, DH indicates windows without muntins. Windows without muntins are standard. See note B, next page.

* Window Dimension equals the Masonry Opening required for one unit.

Hardware

8. Pulleys shall be machined from cold rolled steel and shall have oilless bearings. They shall be supported by a 13 gauge steel pulley pan. Sash shall be hung on galvanized steel sash chain (American Chain Co. No. 130).

9. The glazing strip for the lower rail of bottom sash shall be formed to serve as a sash lift.

10. Meeting rail lock, pull down handle and pull down socket of malleable iron, cold galvanized, shall be furnished, shipped unattached.

Erection and Painting

Note:—See page 3 for general information on calking, painting and erection. See also Note B, next page. Lupton Double Hung Windows (Types E and F) are shipped assembled. The chain is wired tight inside the jamb box, and the sash weights are shipped unattached.

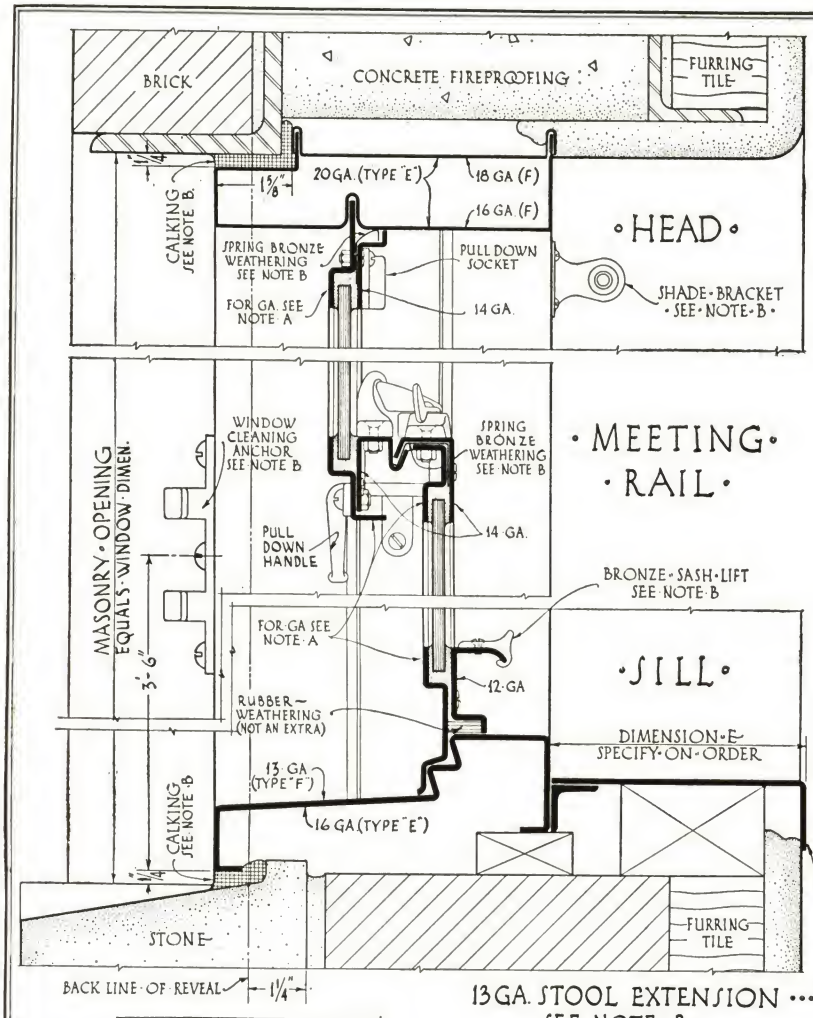
11. All Lupton Double Hung Windows shall be erected in prepared openings by the window contractor. They shall be set plumb and true, securely fastened in place and properly adjusted before glazing.

Note:—Include in the masonry specification that all masonry openings shall be accurately constructed in accordance with the installation details for Lupton Double Hung Windows, and that all mortar, grouting, pointing, etc., shall be done by the mason contractor after windows have been erected.

12. All windows shall receive one coat of window manufacturer's standard gray galvanized metal primer before leaving the factory.

Glass and Glazing

Note:—(See page 3.) Specify glass and glazing under proper heading elsewhere in specifications.



(a) Do not specify single thickness glass.

(b) Specify high-grade steel window putty (ordinary wood sash putty must not be used).

(c) Specify that all Lupton Steel Double Hung Windows shall be glazed from the inside; that all glass shall be set in a bed of putty and held by glazing strips attached with low round-head machine screws.

DETENTION « WINDOWS

Windows for detention purposes are designed and manufactured by Lupton in several types to suit the varying conditions under which they are used. Because of the wide range of applicability and the unique features of the double hung type detention window, it has been selected for special treatment in these pages. If requested, Lupton will give additional information on this or other special types of Detention Windows.

Suggested by Dr. Simon Goldwalter, Mt. Sinai Hospital, New York, and developed by the Construction Division of the Veterans' Bureau assisted by DAVID LUPTON'S SONS CO. This type of window was designed to confine insane and neuropsychiatric patients without resorting to the usual jail-like bars. The thought was kept in mind that the window should be simple in operation and require no instructions to inmates for easy control, and therefore the double hung window was selected as being the most familiar type.

The Lupton Double Hung Detention Window, as a result of this development, combines the following features:

1. *Secure Detention.* All openings are limited to 6 in. or less. Lights of glass are small. Glazing is done from outside.

2. *No loose parts.* No parts are removable except with key or special tool. All working parts are concealed.

3. *Pleasing in appearance.* No bars are used except those in the ornamental grille on the outer part of the window.

4. *Maximum opening.* Without sacrificing the detention features, 50% opening (the maximum possible with double hung windows) can be obtained.

5. *Easily operated.* This familiar type of operation requires no explanation to inmates who may be permitted to control ventilation to suit individual desires.

6. *Locking.* Sash can be locked in open, intermediate or closed positions by means of a special key if desired, although locking is not necessary for detention purposes.

7. *Weatherstripped.* Aluminum combination parting strip and weatherstripping provides continuous non-rattling contact at jambs.

8. *All metal construction.* All sash and frame members are of solid rolled steel sections, welded at corners.

9. *Screening.* Easily screened with double sliding screens.

Types of Grilles

The details given here indicate but one type of grille, the type which is hinged to swing out at the side when unlocked. If desired, a grille of another type (developed under direction of Dr. White of St. Elizabeth's Hospital, Washington, D. C.) may be used which opens downward and forms a platform for window cleaners.

Auxiliary Windows

In parts of buildings where the detention features are not needed, the Georgian Window described on pages 48 to 53 or Lupton Standard Counterbalanced Windows may be used.

SPECIFICATIONS

Work Included

1. Furnish and install where shown on drawings steel double sliding windows of Detention Type as manufactured by DAVID LUPTON'S SONS CO., Philadelphia, Pa.

Materials

2. Frame and sash members shall be hot rolled steel sections. Parting strips shall be extruded aluminum. Outside frame shall be of 14 ga. steel plate.

Weights of sections shall be not less than the following:

"I" shaped jamb member	4.5	lbs. per ft.
"H" shaped head member	2.2	lbs. per ft.
Special channel shaped sill member	2.3	lbs. per ft.
Channel shaped sash member	2.06	lbs. per ft.
Combined meeting rail members	3.65	lbs. per ft.

Construction

3. Windows shall be designed for outside putty glazing.

4. Frame and sash members shall be assembled with welded joints. Exposed welds shall be ground off flush with members.

5. Muntins shall be tenoned and riveted to sash members and shall have flush interlocking joints at intersections.

6. Outside plate frames shall be of details and dimensions shown and securely attached to frame members.

Note:—Dimensions may vary to meet screen conditions and surrounding construction.

Note:—Inside plaster mould when desired should be furnished under another specification.

7. Strap anchors 1¾x$\frac{3}{16}$ in. shall be welded, three to each jamb and shall extend no less than 8 in. from back of jamb member.

8. The sash shall be hung on spring balances (two for each sash). Balances shall be enclosed in housings, one housing securely riveted to each jamb and joints calked to prevent entrance of moisture when set in masonry. Balances shall be removable.

9. Attachment of spring balance tapes to sash shall be at bottom rail, by means of specially designed tape staples and sash clips, and in such manner that tape (including tape staple) hangs vertically. Clips shall be securely attached to bottom rails with interrupted slot screws.

10. Sash shall make double contact with head and sill and shall interlock at meeting rail. At jambs, aluminum parting strip shall be designed to serve as a weatherstrip.

Balances

11. Type "D" Caldwell Spring Balances (manufactured by Caldwell Manufacturing Co., Rochester, N. Y.) shall be furnished fitted with bronze tapes not less than .016 in. thick and tape staples for attaching to sash. Staples shall have a hole for attaching guide wire.

12. Provisions shall be made for relieving tension and for adjusting tension without necessity of removing balances.

Sash Stops and Tape Cover

13. Windows shall have sash stops and tape covers so located that neither the spring balances nor the tapes are exposed when sash are operated within detention limits.

Continued on next page

SPECIFICATIONS

Continued from preceding page

14. Tape cover shall be 14 ga. steel channel set in the runway of the lower sash and extending from a point 1 in. below meeting rail, to a point not more than 6 in. below the head frame member. Lower end of cover shall be bent out to fill approximately the space between the sash member and the jamb.

15. To the upper end of the tape cover shall be welded a piece of 1½-in. channel filling the space between the end of the tape cover and the head frame member. This channel shall form a stop for the lower sash.

16. Stops and tape covers shall be attached with ¼-in. countersunk head interrupted slot screws.

17. Upper sash shall have one stop at each jamb limiting the opening to 6 in. Stops shall consist of specially designed steel bars extending from the outside face of the window through the frame and into the sash runway. The grille (described in other specifications) when closed must hold stops securely in place. Stops must be designed so that when the grille is opened they may be withdrawn, but not removed, permitting sash to be lowered to the sill.

Grilles and Grille Clips

Note:—Grilles, grille locks and hinges shall be furnished under another contract. Grilles shall be designed to allow not more than 4½ in. between bottom rail and sill, nor more than 5½ in. between top of grille and nearest point on lower rail of lower sash when sash is raised to its upper limit.

18. Four grille clips shall be furnished welded to the backs of the jamb frame members and extending through the face of the outside frames. The joint between the outside frame and the clip shall be sealed watertight. Two clips on one jamb shall be notched to act as keepers for grille locks. The two clips on the opposite jamb shall be drilled and tapped for attaching grille hinges.

Hardware

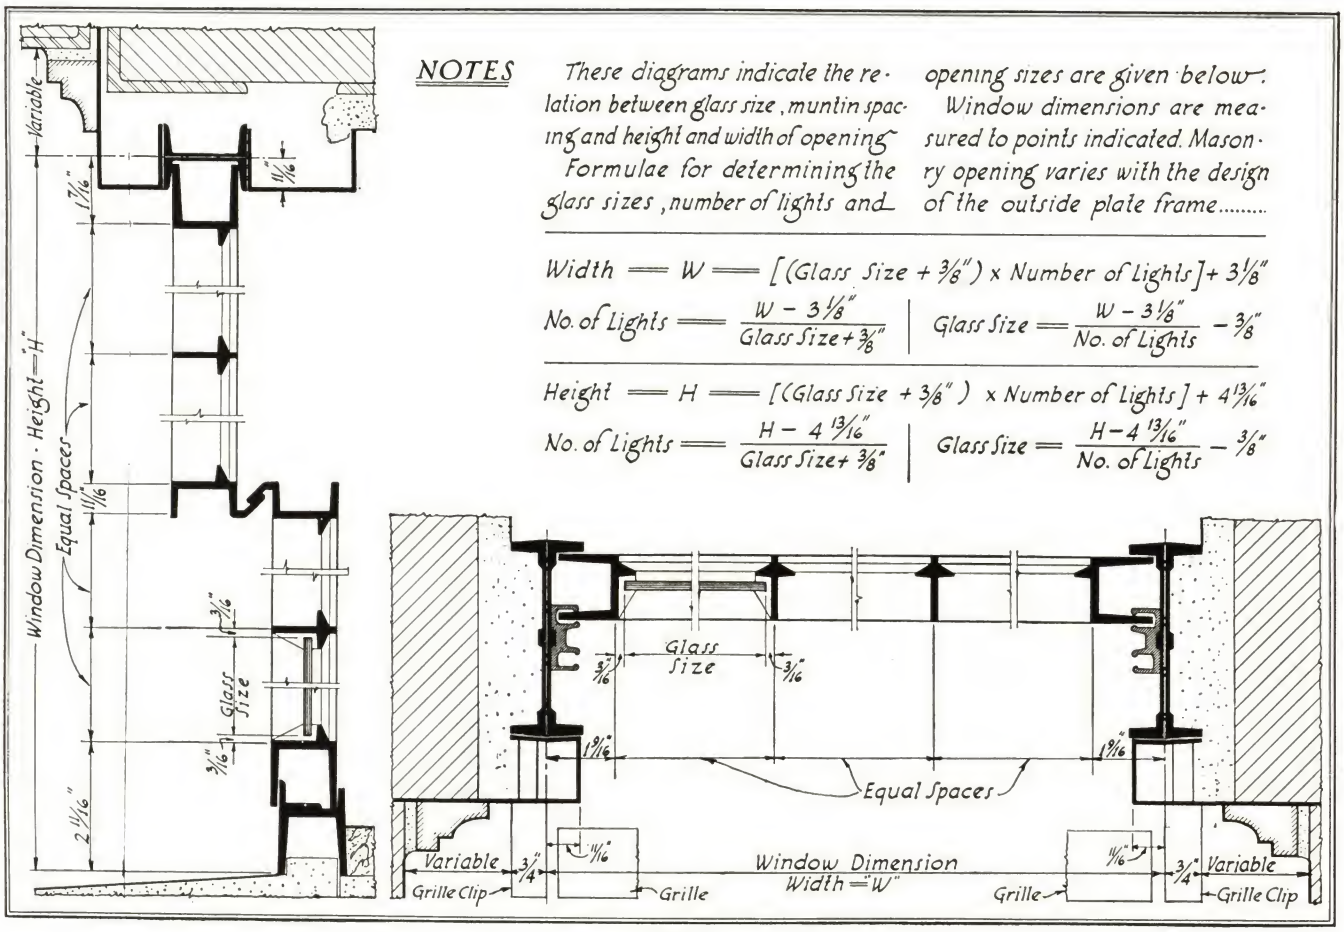
19. An approved method of locking the Spring Balanced Detention Windows in the closed, limited open and intermediate positions shall be provided. Four removable keys shall be supplied.

20. Special light malleable iron bar lifts shall be provided on the bottom rail of the lower sash of all Spring Balanced Detention Windows.

Erection and Painting

Note:—Setting the window frames may be done by the general contractor, but in such case the window manufacturer shall attach all hardware, and after the glazing and painting has been completed, shall carefully adjust the tension on all balances to assure proper balance for each sash. For painting see page 3.

Glass and Glazing



Note:—(See page 3.) Specify glass and glazing under proper heading elsewhere in specifications.

(a) Do not specify single thickness glass.

(b) Specify high-grade steel window putty (ordinary wood sash putty should not be used).

(c) Specify that all Spring Balanced Detention Windows shall be glazed from the outside; that all glass shall be set in a bed of putty and held by wire glazing clips, four to each light.

COMMERCIAL PROJECTED AND PIVOTED WINDOWS

These two types of windows are almost identical in construction, the difference is in the operation (or hanging) of the movable portion or ventilator.

Both types have a wide range of application though mostly used for industrial buildings and buildings of like character. Both types can be screened and are available in aluminum sections. All windows are drilled for attaching shade brackets.

SPECIFICATIONS

Work Included

1. Furnish where shown on drawings Lupton Steel Commercial Projected Windows (or Lupton Steel Pivoted Windows) as manufactured by DAVID LUPTON'S SONS CO., Philadelphia, Pa.

Materials

2. Ventilator and frame members, muntins and mullions shall be of hot rolled steel.

3. Frame member shall be special angle section, muntins shall be cruciform section 1⅜ in. deep, and mullions shall be T bars.

Note:—Structural steel members forming imposts are not furnished by the window manufacturer.

Construction

4. All Commercial Projected (or Pivoted) Windows shall be designed for inside glazing.

5. Both frames and ventilators shall be assembled by tenoned, riveted joints at corners. (Commercial Projected Ventilators shall have corners welded in addition to riveting.) Continuous two point, flat weathering contact shall be provided between frame and ventilator.

6. All muntins shall be continuous thru, and interlocked at, their intersections. They shall be attached to frame or ventilator members by tenoning and riveting.

7. Vertical mullions shall be provided where two or more units are to be placed side by side in one opening.

Note:—For Jamb plates see note at end of specifications.

8. Where windows are anchored to steel structure, furnish clips of types to suit conditions.

9. Furnish anchor clips at sill, at least one clip for each two lights in the width of a unit.

10. Where hardware is to be attached to bottom rail of ventilator, a clip for this purpose shall be riveted to ventilator.

11. *Commercial Projected Windows* shall have ventilators accurately pivoted at sides on two steel arms attached to window frames by steel arm blocks. Each ventilator shall be equipped with two rustproofed flat, steel springs and two brass friction shoes. Friction shoes shall slide vertically in the channels formed by the side weathering of the ventilators with sufficient friction to hold the ventilators in any open position up to the limit of their movement and to prevent rattling.

12. *Pivoted Windows* shall have ventilators horizontally pivoted as follows:

(Specify one of the following as desired.)

(a) *(Standard)* Pivots shall be located two inches above center line of ventilator.* Pivot plates shall be integral with the side weathering. Pivot pins shall be $\frac{5}{16}$-in. iron rivets fastened with cotter pins.

Or (b) *(Friction Pivots for Unscreened Pivoted Windows.*)* Pivots shall be located two inches above center line of ventilator. Pivot plates shall be integral with side weathering and shall be clamped with bronze friction plates in a malleable iron yoke by a cadmium plated bolt. Friction shall be adjustable to hold ventilator at various degrees of opening without stay bar.

Or (c) *(Pivots for Screened Pivoted Windows.* See screens.)* Pivots shall be located on center line of ventilator. Pivot plates shall be malleable iron castings. The pivot pin shall have a bronze bushing. Friction shall be adjustable from inside and shall be sufficient to hold ventilator at various degrees of opening.

Hardware

13. All hardware shall be shipped unattached, carefully packed.

14. *Commercial Projected Windows* shall have the following malleable iron hardware:

For open out ventilators—Ring handle and pull down ring.
For open in ventilators within reach—Locking handle.
For open in ventilators beyond reach—Spring catch.

15. *Pivoted Windows* shall have the following hardware:

(a) *(Standard)*—Provide stay bar and clip for ventilators within reach from floor, provide spring catch, chain, chain roller guide and clip for vents beyond reach from floor.

(b) *(Alternate—Used with friction pivots.*)* Provide ventilators with ring type locking handles. Where vents are beyond reach from floor provide pull-down rings in addition to handles.

(c) *(Alternate—For Screened Pivoted Windows.*)* Provide malleable iron locking handle where top rail of ventilator is within reach from floor and malleable iron spring catch for pole operation where beyond reach from floor.

Erection

16. All Commercial Projected (or Pivoted) Windows shall be erected by the window contractor (or state by whom) in prepared openings.

Note:—Setting in prepared openings is the recommended practice. Include in the masonry specifications that all masonry openings shall be accurately constructed in accordance with the installation details for Lupton Commercial Projected (or Pivoted) Windows. All grouting, pointing, etc., should be done by the mason contractor after the windows are set. *Note:—See page 3.*

17. Windows shall be set plumb and true, properly aligned and securely anchored and all ventilators properly adjusted before glazing.

18. All hardware shall be applied under window manufacturer's directions.

Painting

19. All windows shall receive one shop coat of window manufacturer's standard, dark gray paint, oven-dried.

Glass and Glazing

20. Furnish standard wire glazing clips, four to each light.

Note:—(See page 3) Specify glass and glazing under proper heading elsewhere in specifications.

(a) Do not specify single thickness glass.

(b) Specify high-grade steel window putty (ordinary wood sash putty must not be used).

(c) Specify that Lupton Commercial Projected (or Pivoted) Windows shall be glazed from the inside; the glass set in a bed of putty and held by Lupton standard wire glazing clips.

Continued at top of next page.

COMMERCIAL PROJECTED and PIVOTED WINDOWS

Specifications continued from preceding page.

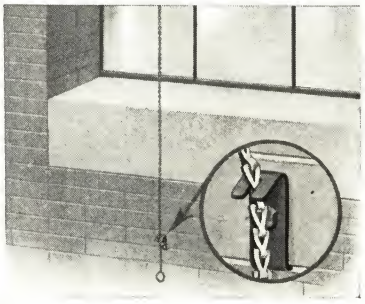
Or specify that Lupton Commercial Projected (or Pivoted) Windows shall be glazed from the inside; the glass set in a bed of putty and held by steel glazing angles fastened with udylited round head machine screws.*

*Screens**

21. All Commercial Projected (or Pivoted) Windows shall be equipped with flat screens. Screens shall fit closely so as to prevent entrance of insects.

22. Screen frames shall be rectangular steel tubing 1x$\frac{7}{16}$ in. galvanized, reinforced at corners and painted one coat of gray paint to match the windows. They shall be rewireable. Wire shall be 16 mesh bronze wire cloth.

23. "Projected in" ventilators shall have screens on outside; "projected out" ventilators shall have screens on the inside.

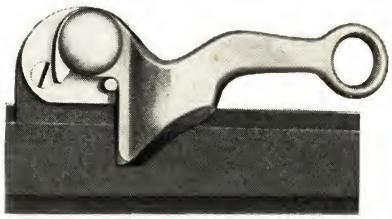


24. Each pivoted ventilator shall have two flat screens, one on the outside of the upper half of the vent and one on the inside of the lower half. The bottom of the upper screen and the top of the lower screen shall bear at all times against curved plates attached to the vent at the center line so as to prevent entrance of insects.

**Note*

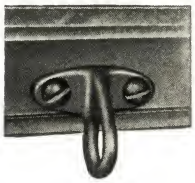
The following items are furnished when clearly indicated in original specifications or on drawings and mentioned in contract for windows.

1. Pivoted Windows with pivots located elsewhere than 2 in. above center of ventilator.
2. Friction pivots without screens.
3. Screens. See pages 77 and 78.
4. Continuous glazing angles (These are required on underwriters' labeled windows).
5. Underwriters' labels, see page 79.
6. Jamb plates, see page 78.
7. Bronze hardware.
8. Mechanical operators, see page 81.
9. Window cleaners' anchors.
10. Mullion covers, see page 75.



HARDWARE

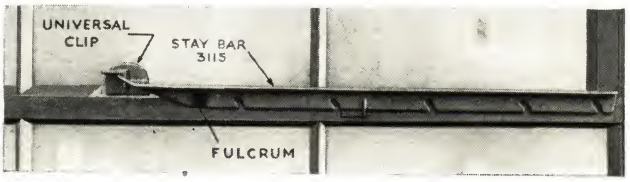
See note at end of Specifications.



At right. Locking Handle No. 511. Malleable iron painted. Used within reach from floor on Projected in at top and Screened Pivoted Ventilators. Spring Catch No. 509, also malleable iron, is used beyond reach.

At right. Locking Handle No. 141. Malleable iron painted. Used on Projected out at bottom Ventilators and unscreened Pivoted Ventilators with friction pivots.

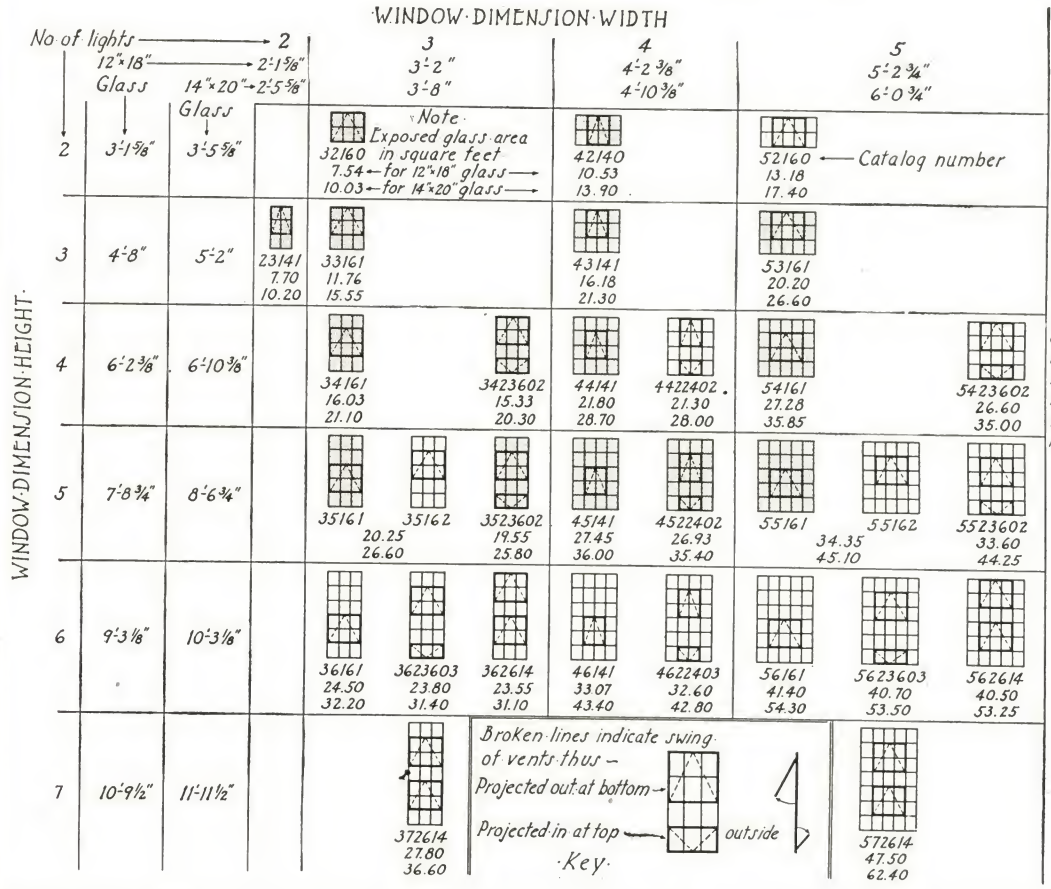
*At left. Two Ventilators in a Unit. Standard units have upper ventilator equipped with Spring Catch 3130, Chain roller guide 3102 and 12 ft. of chain. Lower ventilator is equipped with stay bar 3115.**



At left. Pull Down Ring No. 4881. Malleable iron painted. Used on Projected out at bottom Ventilators and unscreened Pivoted Ventilators with friction pivots.

At left. Steel Clip No. 3018 attached to window holds either stay bar or chain.

Below. Steel Angle Stay Bar No. 3115. This bar in addition to holding the ventilator open will draw the ventilator tightly shut and lock it when inserted in clip No. 3018 provided for the purpose.

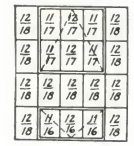


At left. Steel Clip No. 2365. Used to fasten chain when sill is beyond reach from floor.

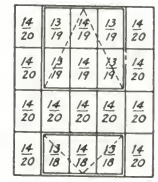
**Where sill height is given on order, spring catch, chain, etc., is furnished on all vents having bottom edges over 6 ft. above floor, and clips No. 2365 are furnished where required.*

STANDARD TYPES and SIZES

Commercial Projected Windows

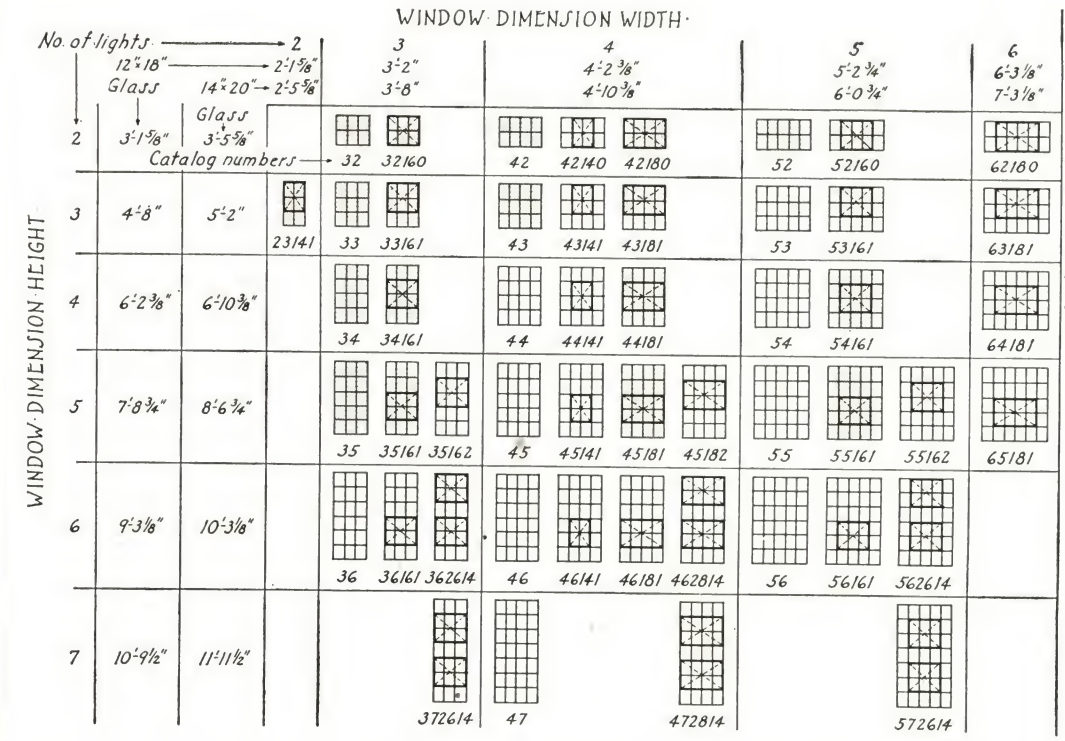


NOTES



Shaded units are dealer stock windows.

Dimensions – The window dimension of a unit is the same as the masonry or structural opening required for that unit.



Glass – Glass in fixed lights is full 14×20 or 12×18 inch in size. Border lights in ventilators are reduced as shown in diagrams below to allow 1 inch for weathering.

Special Glass Sizes – Window dimensions of units with special size glass are obtained as follows: Add ⅜ inch to glass size for fixed lights (width or height as required), multiply by the number of lights and add ⅞ inch.

Pivoted Windows

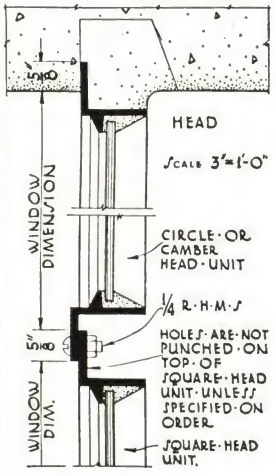
NOTES

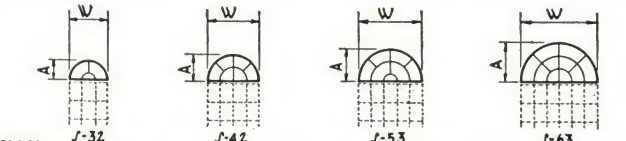
Shaded units are dealer stock windows.

Dimensions – The window dimension of a unit is the same as the masonry or structural opening required for that unit.

Glass – Glass in fixed lights is full 14×20 or 12×18 inch in size. Border lights in ventilators are reduced as shown in diagrams below to allow 1 inch for weathering.

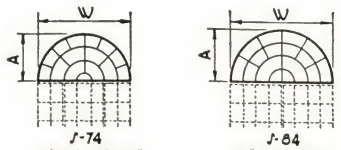
Special Glass Sizes – See note at top of this page.





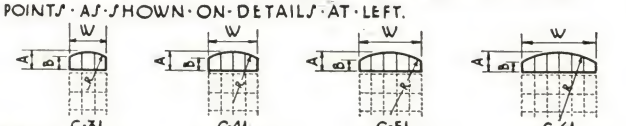
COMMERCIAL PROJECTED and PIVOTED WINDOWS

Standard and stock size and designs are shown on this page and page 74. Sizes and designs other than standard must be detailed specially and consequently take more time for delivery and cost more. However, where special glass sizes are necessary window dimensions may be determined as follows: Add 3/8 in. to glass size for fixed lights (width or height as required), multiply by the number of lights and add 7/8 in.



In listing windows always give the glass size followed by the symbol number of the unit.

SIZES AND ATTACHMENT DETAILS FOR CAMBER AND CIRCLE HEAD UNITS



GLASS SIZES	12"x18"	14"x20"
S-32 W →	3'-2"	3'-8"
S-32 A →	1'-7"	1'-10"
S-42 W →	4'-2 3/8"	4'-10 3/8"

COMMERCIAL PROJECTED and PIVOTED WINDOWS UNDERWRITERS' TYPE

Wherever wire glass is to be used for fire protection it is advisable to specify Labeled Windows. Below in condensed form are the underwriters' specifications as they apply to Projected and Pivoted Windows. Standard Windows of these types are readily converted to meet the requirements for labels.

Underwriters' Labeled Windows are furnished only when clearly indicated on original drawing and in specifications and mentioned in contract for windows.

UNDERWRITERS' REQUIREMENTS

Before the windows can be labeled the underwriters' inspector must be informed as to the number and size of units in each masonry opening and the details at head, jambs and sill. The latter is required so that the proper anchoring connections may be furnished.

Opening Sizes

1. Single Unit openings may not exceed 84 sq. ft. area. Neither width nor height may exceed 12 ft.

2. Multiple unit openings may not exceed 12 ft. in height. Opening width is not limited, but no unit may exceed 7 ft. in width.

Glass Sizes

3. Maximum exposed glass area of single light is 350 sq. in. Maximum dimensions measured tip to tip of glazing angles are 48 ins. horizontally, 54 ins. vertically.

Note:—Glass in standard units is less than this.

Ventilators

4. All projected ventilators must open out.

5. Hinges for pivoted vents must have stop lugs limiting opening to 135°.

6. No more than two ventilators may be used in a unit.

7. Maximum area of one ventilator is 20 sq. ft. Maximum dimensions are 5 ft. horizontally, 4 ft. vertically.

Note:—The maximum size recommended is 41x38 in. which is a ventilator 3 lights wide, 2 lights high, 14x20 in. glass.

Hardware

8. All hardware must be malleable iron.

9. *Projected ventilators* may be operated by gravity type handle (No. 141, page 73) or spring catch. A chain may be used to operate handle or spring catch beyond reach from floor, or a pull down ring (No. 4481 page 73) may be used for pole operation.

10. *Pivoted ventilators* may be operated by spring catch and chain or gravity type handle (No. 141, page 73) and chain. Chain arrangement is same as used for standard windows with addition of a fusible link (see detail on this page).

Mullions

11. Mullions must be "T" section as shown in details C and D. page 76, anchored at head and sill by means of clips, bolts or embedded in the masonry.

Construction of Units

12. Construction is the same as for the Lupton Standard Commercial Projected or Pivoted Windows with addition of glazing angles and expansion interlocks. (See detail on this page.)

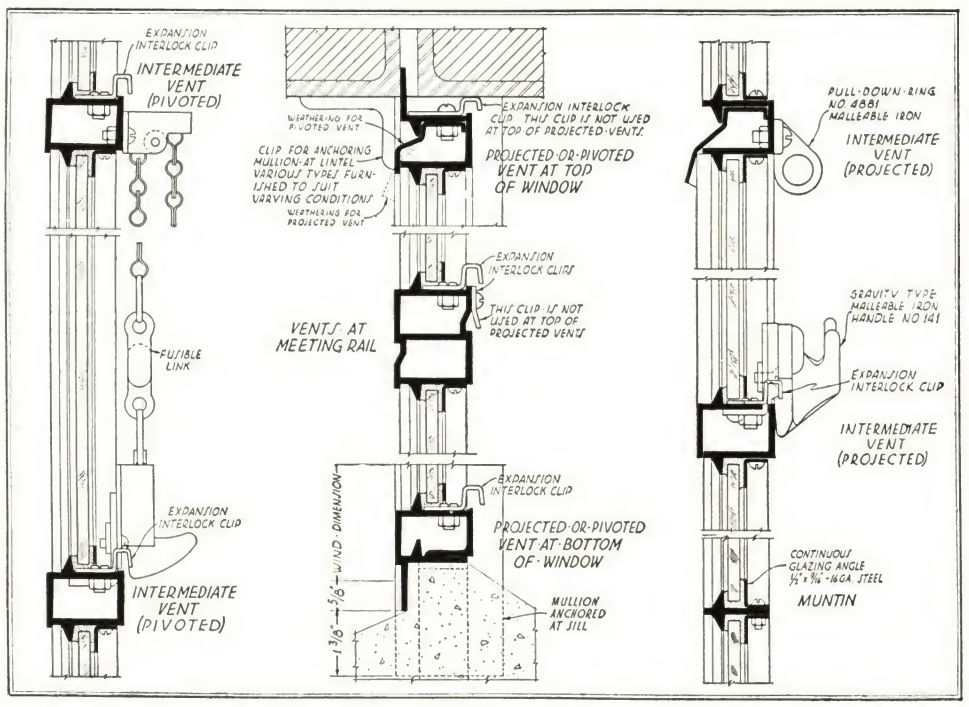
13. Curved or splayed head units cannot be labeled.

Glazing Angles

14. Glazing angles ($\frac{9}{16}$x$\frac{1}{2}$x$\frac{1}{16}$ in.) must be fastened to the window sections with steel screws. The $\frac{9}{16}$-in. leg must be upstanding.

Note:—Small lights up to 100 sq. in. area may have $\frac{5}{8}$ in. upstanding leg.

Glass



15. Glass must be ¼-in. thick wire glass.

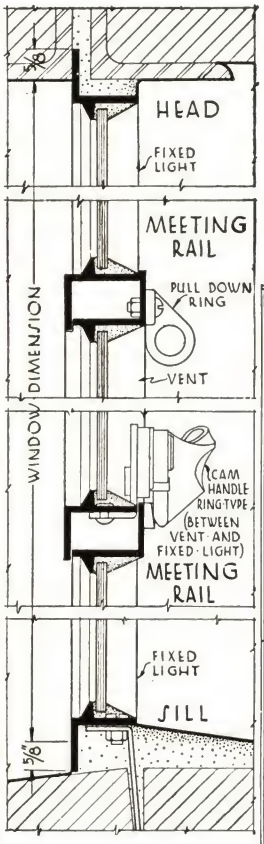
Anchoring

16. Windows must be anchored by embedding the window flange in the masonry or by using any of the clips or anchors illustrated on page 76. Spacing of anchors is different from the standard and is as follows:

At Head or Sill—One not more than 8¼ in. from each end of frame member and one approximately at center of each light.

At Jamb—One not more than 12 in. from each end of frame member and one approximately at center of each light.

At Left. Details illustrating underwriters' requirements. Scale 3 in. equals 1 ft. 0 in.

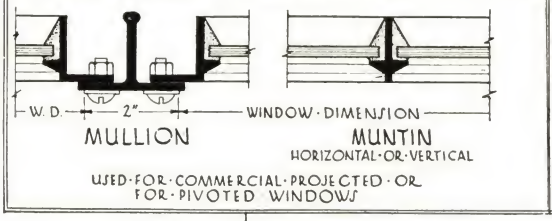


ALUMINUM WINDOWS IN PROJECTED and PIVOTED TYPES

Sections, glass sizes, wall details and anchoring are same as for steel windows. Available sizes are shown in diagrams. Ventilators must extend the full width of units.

Muntin intersections are welded and in the projected type corners of frames and ventilators are welded. Pivoted vents have cadmium plated malleable iron friction hinges, projected vents have white bronze friction shoe with sherardized coil spring and anti-cling insert.

Locking hardware is all of white bronze with dull lacquered finish same as for Aluminum Casements. See page 27.



Windows have natural extruded aluminum finish. (For finish of windows and general properties of aluminum, see page 26.)

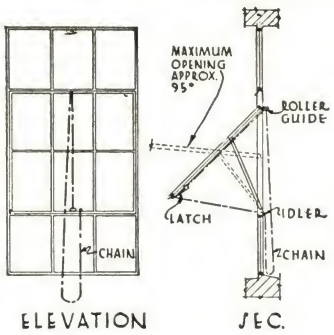
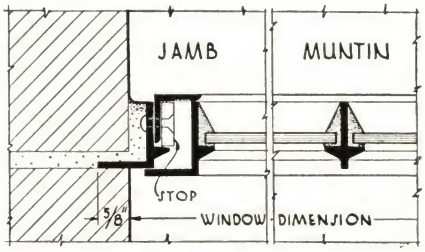
PIVOTED

COMMERCIAL PROJECTED

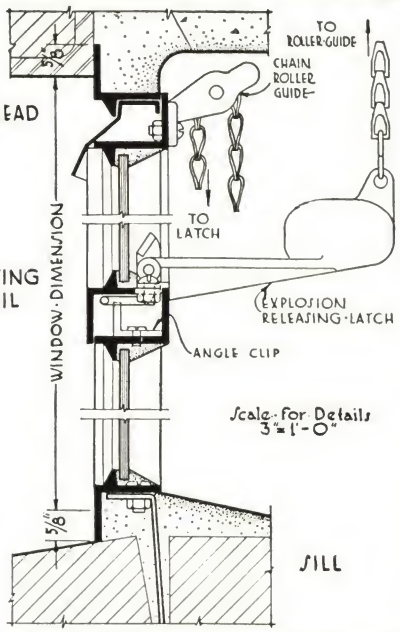
EXPLOSION RELEASING LATCH



For Commercial Projected Ventilators



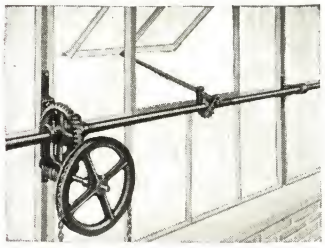
Commercial Projected Windows equipped with explosion releasing latch operate automatically to relieve internal explosive pressure. Used wherever explosion hazard is present as in film storage rooms, etc.



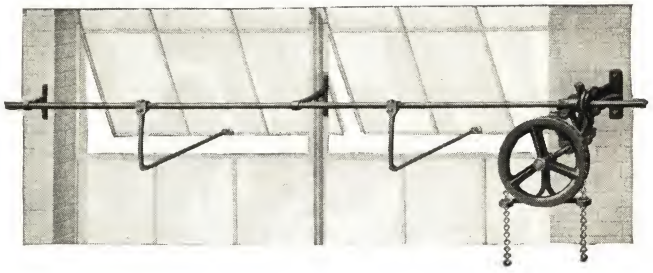
Construction of the window is the same as for the standard Commercial Projected Window except that a special friction shoe is used. Opening sizes, glass sizes and anchoring details are same as for Standard Commercial Projected Windows. See pages 72 to 77. Glass must be 1/4 in. thick wire glass.

Normally the window is operated by the hand chain shown in illustration. Under explosive pressure, however, the vent will open and remain open until closed by hand.

Patent Applied For



PIVOTED WINDOW OPERATORS



Mechanical Operators for Pivoted Windows are available in two general types—tension type and torsion type. Torsion operators prove economical in most cases, but where the requirements exceed the limits of torsion operators a form of tension operator described on page 87 is recommended.

With torsion operators ventilators are controlled by lever arms (Lever Type Operator) or racks and pinions (Rack and Pinion Operator) mounted on a horizontal shaft which is supported in brackets attached to wall or window mullions. Power is applied to the horizontal shaft through a worm and gear which also locks the ventilators at the desired degree of opening. Worm and gear may be open type or fully enclosed to run in oil and may be operated by hand chain, hand wheel or electric motor. Electrical power usually proves economical only for Rack and Pinion Operator. Details are given on pages 82 and 83.

At left. Rack and Pinion Operator. Malleable iron pinion gears securely attached to horizontal shaft operate the steel channel racks to open and close the ventilators.

At right. With the Lever Type Operators the ventilators are controlled by steel operating arms clamped to the horizontal shaft and connected to the vent by steel vent rods.

SPECIFICATIONS FOR LEVER TYPE OPERATOR

Work Included

1. Furnish and install where shown on drawings Lupton Operating Device, manufactured by DAVID LUPTON'S SONS COMPANY, Philadelphia, Pa.

Materials and Construction

2. Power shall be a machine cut steel worm operating a gray cast iron segment worm gear assembled with a gray cast iron yoke and mounted on a malleable iron supporting bracket adapted to rigid attachment to building construction, or, by means of extension clips, to window mullion. The hub of the segment gear shall be drilled to fit the power transmission line and shall be tightly secured to it with set screws so as to rotate the line on the gear axis.

Note:—There are two types of power shaft: 1 in. and ½ in. The larger will operate runs up to 40 ft. on each side of power, and no more than 12 average size ventilators. The smaller will operate runs up to 10 ft. on either side of power and no more than 6 average size ventilators.

3. Power shaft shall be standard black wrought iron pipe joined into a continuous line by standard threaded pipe couplings, screwed tight and secured by two ¼-in. steel pins.

4. Shaft shall be supported by malleable iron brackets attached to the window mullions or to the building construction.

5. Steel operating arms (one to each ventilator) shall be rigidly clamped to the shaft.

6. Connection between the operating arm and the ventilator shall be made by a steel vent rod and a malleable iron bracket mounted on the ventilator. Pivot pins at both ends of the vent rod shall be bronze.

Note:—Specify operation by chain or by vertical steel shaft.

7. Chain Operation—Power shall be operated by No. 9 Register hand chain, operating over a chain wheel and guided by a guard. Both wheel and guard shall be gray iron castings. Wheel shall be accurately drilled, mounted on worm shaft and securely held by a setscrew. Chain shall terminate approximately 2 ft. above the floor.

Note:—Where building construction makes it impractical to hang the chain directly vertical from the power (as in monitor window installations) single and double chain idlers are furnished if clearly indicated on original drawings and in specifications, and mentioned in contract for operators. See page 89.

8. Steel Shaft Operation—Power shall be operated by a vertical ¾-in. round steel shaft, coupled directly to the worm shaft with a malleable iron coupling. The shaft shall be supported by adjustable malleable iron brackets spaced not over 6 ft. apart, one bracket always being placed at the lower end of the shaft, approximately 4 ft. above the floor.

Note:—Lower end of shaft may be terminated in either one of two ways, specify which.

9. (a) (Wheel in horizontal plane.) A gray iron hand wheel and handle shall be mounted on the lower end of the shaft.

(b) (Wheel in vertical plane.) The shaft shall be directly connected by a malleable iron coupling to a pair of miter gears of cut machine steel assembled with a gray iron hand wheel and handle on an adjustable malleable iron bracket.

Note:—When specified and mentioned in contract for operators a gray cast iron housing is furnished for the miter gears.

Note:—Where building construction makes it necessary, universal joints for the vertical shaft are furnished if clearly indicated on original drawings and in specifications and mentioned in contract for operators. The angle between two adjacent lengths of shaft must not be less than 135°.

Erection

10. All operating devices shall be erected and adjusted to proper working order by the window contractor.

Painting

11. All operating devices shall have one coat of manufacturer's standard, dark gray paint, oven dried and applied before shipment.

Note:—The following should be provided for in the paint specifications—one coat of red lead and oil should be applied after erection followed by one or more coats of finishing paint as required.

SPECIFICATIONS for RACK AND PINION OPERATOR

Work Included

1. Furnish and install where shown on drawings Rack and Pinion Operating Device, manufactured by DAVID LUPTON'S SONS CO., Philadelphia, Pa.

Materials and Construction

2. Power.

Note:—There are three types of powers as follows:

(a) Power shall be a worm and gear having a 40 to 1 ratio. Worm to be cut from steel, worm wheel to be cast iron with cast teeth and fastened to the horizontal shaft with two setscrews. Worm and wheel shall be held in mesh by a cast iron yoke.

(b) Power shall be a worm and gear having a 26 to 1 ratio. Worm to be cut from steel and provided with a thrust bushing. Worm wheel to be cast steel with cut teeth and fastened to the horizontal shaft with two ¼-in. diameter steel pins. Both worm and gear shall be enclosed in an oil tight case.

(c) Power shall be a worm and gear having a 60 to 1 ratio. Worm to be cut from steel and to be provided with two Nice ball bearings. Worm wheel to be cast iron with cut teeth and attached to horizontal shaft with two ⅜-in. diameter steel pins. Worm and wheel shall be enclosed in an oil tight cast iron case.

3. Power shall be mounted on a malleable iron bracket adapted to rigid attachment to building construction or by means of clips to window mullion.

4 and 5. Power Shaft—See specification for Lupton Operating Device Lever Type—paragraphs 3 and 4.

Note:—½ in. pipe is not used for the rack and pinion operator. In addition to the 1 in. standard pipe, 1 in. extra heavy and 1 in. double extra heavy pipe may be used.

6. One rack and pinion shall be provided for each ventilator. Rack shall be of 1x⅜-in. steel channel punched with slots to mesh with a malleable iron pinion clamped with one bolt to the horizontal shaft so tightly as to withstand a pull of 300 lbs. on a 2-in. radius.

7. Rack and pinion shall be held in mesh by two 13 gauge steel yokes with two brass bushed steel rollers.

8. Rack shall be—

Note:—Racks may be straight or curved and may be attached at top or bottom of centered pivoted ventilators. Specify type and where attached.

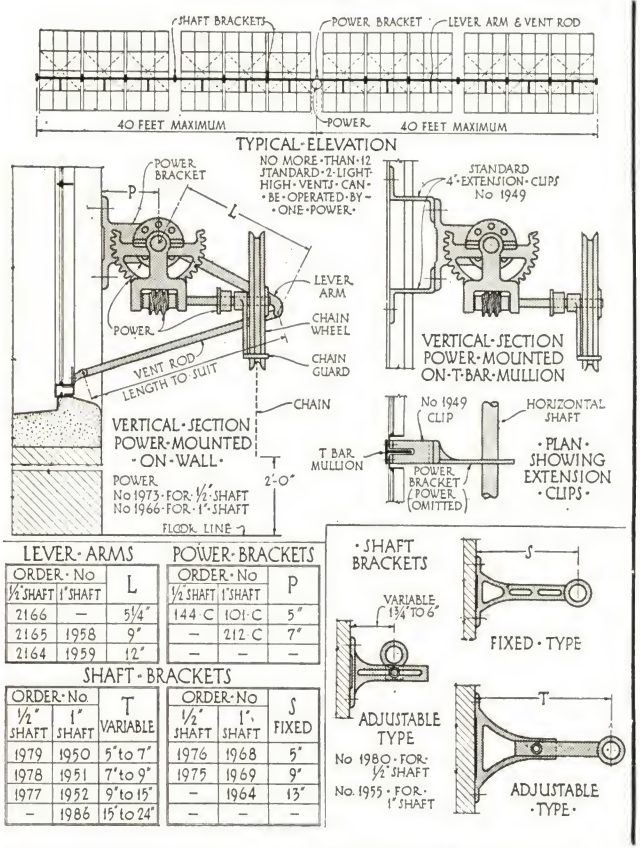
9. A malleable iron hinge shall be provided for attaching the rack to the ventilator. Hinge shall be adjustable so that all vents may fit tight when closed.

10 to 14. Operation.

Note:—See specifications for Lever Type Operating Device, paragraphs 7 to 9 (b) inclusive, on preceding page.

Note:—Power described under paragraph 2 (c) may be operated by motor, specify as follows:

15. Power shall be operated by a motor bolted to the base of power and geared to power with a spur gear. Limit switch shall be attached to power. Push button with open, closed and stop buttons and a motor control panel as well as limit switch shall be furnished by manufacturer.



Note:—Conduit wiring and line switch are to be furnished by the electrical contractor. See "Electrical Construction" under specification for Lupton Tension Operating Device, Lupton page 88.

Erection and Painting

Note:—Same as for Lever type. See preceding page.

CONTINUOUS WINDOWS

The information relating to Continuous Windows on this and following pages will be helpful in laying out elevations and preliminary details. Where special conditions present a more difficult problem a Lupton Representative will gladly furnish additional information, submitting tentative window designs and making recommendations based on Lupton's previous experience with this type window.

Lupton Continuous Windows are effectively used for daylighting and ventilating in sidewalls of industrial buildings and all the familiar types of roof construction including the Lupton V-Type Roof Design.

Units are assembled by welding and joined end to end with expansion covers to form long runs. Units are 20 ft. long except where shorter ones are needed. Operated runs on roofs usually have a stationary end panel 2 ft. long at each end. Overall length of windows should be in multiples of 2 ft. See details on next page. Muntins are spaced approximately 2 ft. apart, glass being 23 in. and 24 in. wide, combined as needed to make up the required length. Heights of units, opening and glass, are as follows:

Unit	*Opening*	*Glass*	*Unit*	*Opening*	*Glass*
3 ft.	2'10½"	33 in.	5 ft.	4'10½"	57 in.
4 ft.	3'10½"	45 in.	6 ft.	5'10½"	69 in.

SPECIFICATIONS

Work Included

1. Furnish and install where shown on drawings, Lupton Continuous Windows, manufactured by DAVID LUPTON'S SONS CO., Philadelphia, Pa.

2. Window manufacturers shall furnish drawings showing location of punching in structural steel for attaching hinges.

Materials

3. Frame Members.

Note:—Structural steel members forming frames for windows, and punching in frames for attaching hinges are not furnished by the window manufacturer and should be specified elsewhere under proper heading in specifications of other trades. The following frame members are required:

(a) A continuous girt angle at the head, to which the hinges are bolted. This angle should not be smaller than 3x3 in., ¼ in. to ⅜ in. thick.

(b) A continuous member at the sill. The face of this girt (usually an angle or channel) should be in the same plane as the face of the girt angle at the head.

(c) A continuous girt angle between upper and lower lines of windows where one line is placed directly above the other. This member should be the same size as girt angle at head when windows above and below are both vertical or both sloping, but when windows above are vertical and windows below are sloping, the leg to which hinges for lower windows are bolted, should be at least 4 in. long.

4. Window Sections.—Top rail, bottom rail and end rail shall be special hot rolled solid steel sections. Bottom rail shall not project beyond surface of glass on the outside. Overlapping end rail shall be 13 gauge steel. Muntins shall be special hot rolled steel T section.

5. Jamb weathering of 13 gauge steel plate, formed, shall be furnished (but not installed) by the window contractor where window extends between pilasters.

6. Flashings.

Note:—Under proper heading elsewhere in specifications of other trades, specify sheet metal flashing at joints of and over gaps between girts, and condensation gutters (where required). These are not furnished by the window manufacturer.

7. Steel clips shall be furnished for storm panels and stationary windows.

8. Glazing wedges shall be of galvanized pressed steel.

Construction

9. All Lupton Continuous Windows shall be designed for outside glazing.

10. All units shall be straight and true with members in alignment and surfaces in a plane. All joints shall be rigid and tight. Members shall be coped, fitted together and oxy-acetylene welded along their entire length of contact.

11. Units shall be hung on malleable iron hinges with heavy bronze pins.

12. Muntins shall be continuous from top to bottom of unit. Joints at top and bottom rails shall be oxy-acetylene welded.

Mechanical Operators

Note:—These are covered in other specifications. *See page 87.*

Erection

13. All Lupton Continuous Windows shall be erected in prepared openings by the window contractor. They shall be set plum and true, properly aligned, securely attached to structural members and properly adjusted before glazing. *(See page 3.)*

14. Where long lines of windows occur units shall be joined end to end with weatherproof expansion joints at intervals of approximately 20 ft.

15. A short stationary panel shall be furnished at each end of an operated line of windows except where window extends between pilasters, and special jamb weathering (described in paragraph 5) is used.

Note:—(a) Storm panels attached to end panels and underlapping the operated windows for a distance of 2 ft. are desirable if windows are to remain open in stormy weather. They are furnished if clearly indicated on original drawings and in specifications and mentioned in contract for windows.

(b) Include under the proper heading elsewhere in specifications of other trades, that all structural steel members that come in contact with Lupton Continuous Windows shall form straight parallel lines and shall be located, punched and flashed in accordance with the Lupton Continuous Window details. Where there is a deflection structural members shall be straightened in the field by the structural steel contractor before windows are erected.

(c) Include in the masonary specification that all masonry openings shall be accurately constructed in accordance with the Lupton Continuous Window details and that all mortar, grouting, pointing etc., shall be done by the mason contractor after windows have been erected.

POWER HOUSE WINDOWS

Power House Windows are made of the same sections and with the same welded construction as Lupton Continuous Windows. Units are set in a structural steel frame furnished by Lupton.

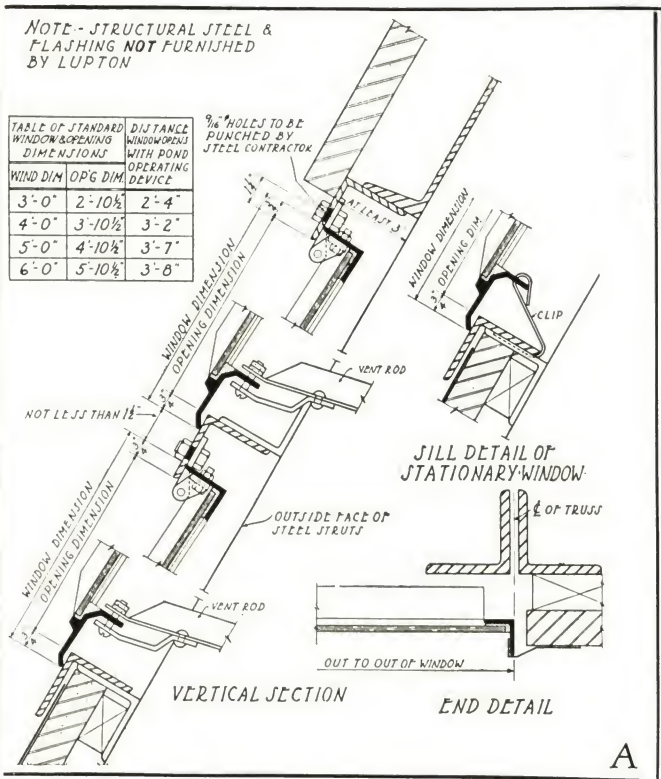
Both the window and operator are usually designed to meet special conditions and therefore a Lupton representative should be consulted for details.

Painting

16. All Lupton Continuous Windows shall receive one shop coat of window manufacturer's standard dark gray paint, oven dried. *(See page 3.)*

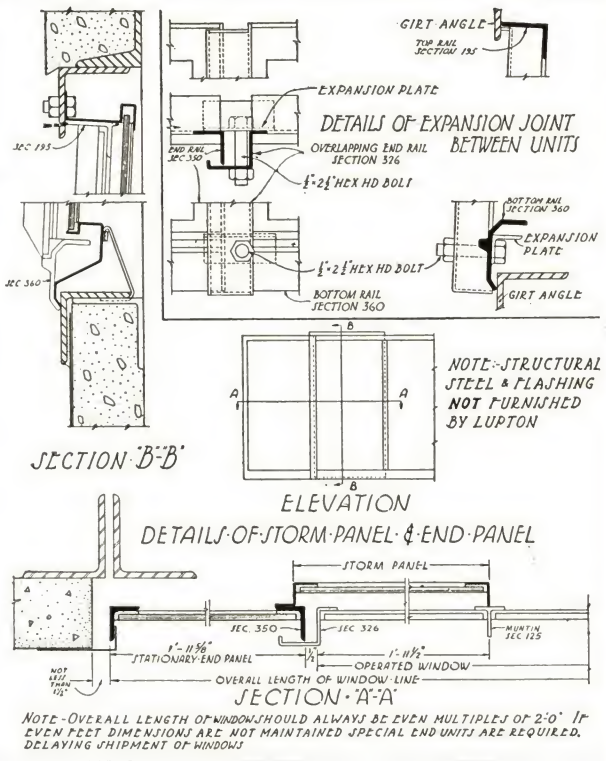
Glass and Glazing

Note:—(See page 3.) Glass and Glazing should be included under the proper heading elsewhere in the specifications of other trades.



(a) Specify vertical ribbed glass ¼ in. thick. (Ribs to be placed on the side least exposed to dust.)

(b) Specify special steel window putty.



(c) Specify that glass shall be set in a bed of putty and secured by steel glazing wedges supplied by the window manufacturer. Four wedges per light shall be used on windows 3 or 4 ft. high and six wedges per light shall be used on windows 5 or 6 ft. high.

CONTINUOUS WINDOW OPERATORS

Mechanical Operators for Continuous Windows are available in two general types, torsion type and tension type. The torsion type Rack and Pinion operator described on page 81 is practicable and economical for small runs (40 to 100 ft. depending on height of window), but for larger runs the tension operator described below is required.

Tension Type Operator

The Lupton Tension Type Operating Device permits operation of extremely long lines of windows. Power is applied by hand chain or motor through worm and gear and transmitted by a double line of steel rods always in tension. Motion is transferred to the windows through pairs of operating arms arranged to eliminate useless stresses, friction and lateral thrust against the transmitting rods.

In a modified form it may be used to operate pivoted windows in groups exceeding the limits of the Rack and Pinion Operator.

Applied to top hung continuous windows the tension operator gives the following degrees of opening:

Windows 3 ft. high open 46° (28 ins.)
Windows 4 ft. high open 47° (38 ins.)
Windows 5 ft. high open 42° (43 ins.)
Windows 6 ft. high open 36° (44 ins.)

Explosion Operator

Pat. No. 1747271

The explosion operator is a tension operator for use in chemical or rubber process buildings, granaries or other industrial buildings where explosion hazards are more or less unavoidable. The explosion operators are made in two types to operate Lupton Continuous Windows. The counterweighted type can be adjusted to operate automatically at any desired atmospheric pressure. The pressure type operator requires the explosive pressure to open the windows. It is recommended for storage buildings where there are no workmen. Both operators continue to hold windows open after explosion has occurred, allow the poisonous gases and smoke to escape and assure a quick change of air.

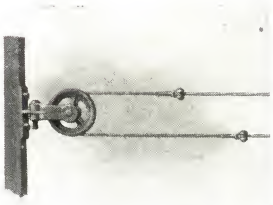
Note:—See also page 80 for an explosion releasing latch for small projected ventilators used in film storage rooms, etc.

SPECIFICATIONS

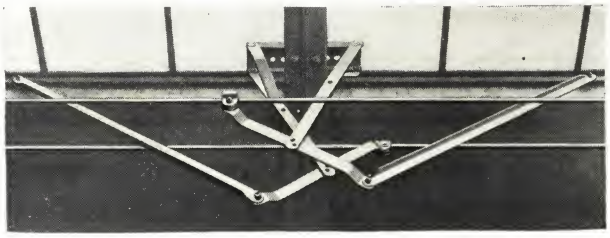
Work Included

1. Furnish and install where shown on drawings Lupton Tension Type Operating Device, manufactured by DAVID LUPTON'S SONS CO., Philadelphia, Pa.

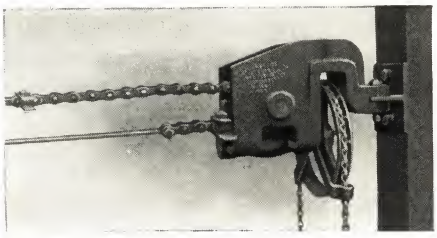
Material and Construction



Note:—Structural Steel supports for Lupton Tension Type Operating Device are not furnished by the window contractor. These consist of uprights (angles, channels or tees) for attaching the operating arms.

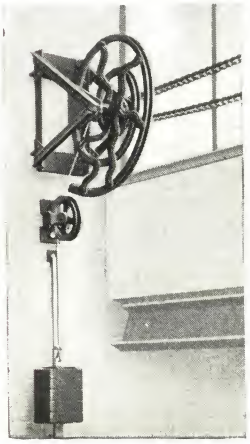


For windows 5 or 6 ft. high the center spacing of the supports should not be less than 7½ ft. nor more than 16 ft.; for windows 3 or 4 ft. high, the spacing should not be less than 6½ ft. nor more than 15 ft. Trusses on 20 ft. centers, with one intermediate usually make the most economical arrangement for steel work.



2. *Power*—The operating power unit shall consist of a machine cut steel worm shaft mounted in ball-bearings operating a machine cut worm wheel. For manually operated powers the worm wheel shall be a steel casting made integrally with the sprocket wheel. For electrically operated powers the worm wheel shall have a bronze rim with cut teeth. Bearings shall be phosphor bronze. The power unit shall be assembled in a dust-proof, grease packed, cast steel case. The worm shall lock the window in any position.

3. *Power Brackets*—Power units shall be mounted on brackets made of structural steel angles, trussed to the building construction and designed to withstand the lateral stresses caused by operating the windows.



Please turn to next page→

Illustrated above and in their correct relative positions are an idler, a set of operating arms and a hand operated power.

At left is shown a spiral and counter weight sometimes used in place of an idler especially on long motor operated runs where it prevents overload when starting motor with windows partly open and keeps load and speed substantially uniform. Table at right shows how spiral increases allowable length of run.

MAXIMUM LENGTHS OF RUNS IN FEET

Height of window	Hand operation		Motor operation	
	Vertical	60° Slope	Vertical	60° Slope
With Idler				
3 ft.	300	194	792	512
4 ft.	190	132	500	346
5 ft.	176	116	463	304
6 ft.	166	100	438	263
With Spiral and Counterweight				
3 ft.	500	323	1320	854
4 ft.	317	220	833	577
5 ft.	294	193	772	506
6 ft.	276	167	730	438

CONTINUOUS WINDOW OPERATORS—SPECIFICATIONS

Continued from preceding page.

Transmission Line

4. Transmission line shall consist of 2 lines of solid round steel rods. (Note: Specify ½-in. or ¾-in. diameter as required by conditions.) Where joints occur rods shall have the ends hot headed and securely clamped in malleable iron couplings so as to develop the maximum tensile strength of the rods. The rods shall not be run through guides, rollers or other bearings. Forged steel turnbuckles shall be furnished for adjusting.

5. At the end of the run the two rods shall be connected by a sprocket chain passing over the sprocket wheel in the power unit.

6.

Note:—There are two ways of terminating the end of the run opposite the power.
(A) With an idler. (B) With a spiral and counterweight. Specify the one desired.

(A) At the end of the run opposite the power unit the two rods shall be connected by a ⅜-in. steel wire cable passing over an idler wheel. Bearing in idler shall be phosphor bronze.

(B) At the end of the run opposite the power unit the two rods shall be connected by a sprocket chain passing over a sprocket wheel of steel cast integrally with a spiral. A weight shall be attached to the spiral by means of a steel wire cable in such a way that as the windows open the weight shall exert increasing force on the transmission line and balance a part of the load.

Operating Arms

7. Operating arms shall be mounted in pairs on 4-in. channel brackets. Brackets shall be rigidly bolted to structural steel supports furnished by others. Arms shall be of flat steel specially constructed to form a rigid T shape and so arranged that all back thrust from the windows shall be transformed into tension in the transmission line. Operating arms shall be attached to transmission rods with malleable iron clamps and connected to bottom rail of window by 1¼x1¼x⅛-in. steel angle. Pivots shall have phosphor bronze bushings.

Manual Operation

8. Manual operation power unit shall be operated by a No. 9 Register hand chain passing over a chain wheel mounted on the worm shaft and secured to it by a setscrew. Chain shall be guided by a suitable guard.

Note:—Where building construction makes it impractical to hang the chain directly vertical from the power (as in monitor window installations) chain idlers are furnished if clearly indicated in original drawings, and specifications, and mentioned in contract.

Electrical Operation

9. Electrically operated power shall be operated by an electrical power unit operating a sprocket and silent chain. Sprocket shall be mounted on the worm shaft secured to it by a steel key. Electrical unit shall be located beneath the power unit and securely bolted to it.

Note:—Immediately following this specification include specification for Electrical Equipment.

Erection

10. (See page 3.) All operating devices shall be erected and adjusted to proper working order by the window contractor.

Painting

11. All operating devices shall have one coat of manufacturer's standard, dark gray paint, oven dried and applied before shipment.

Note:—The following should be provided for in the paint specifications. One coat of red lead and oil should be applied after erection, followed by one or more coats of finishing paint as required.

SPECIFICATIONS FOR ELECTRICAL EQUIPMENT

Work Included

1. The Operating Device manufacturer shall furnish wiring diagram and complete electrical equipment for Lupton Tension Type Operating Device as hereinafter specified.

Electrical Equipment

2. Motors shall be of type best adapted to the power equipment, of high torque and ample horsepower.

Note:—The motors for Lupton Tension Type Operating Device operate on A. C., 220 or 440 volts, 60 cycle, 3 phase, and are especially wound for high starting torque. They are furnished from stock, which avoids delay. Motors with other current characteristics require from four to six months to deliver.

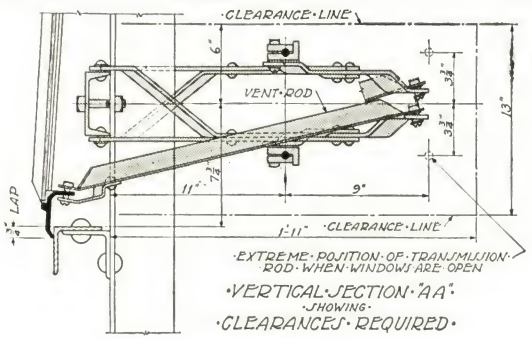
3. Motors shall be connected to power by means of sprockets and silent chains.

4. Standard magnetic reversing switches shall be enclosed in steel boxes and so designed, that the movement of the ventilator either in opening or closing may be stopped or started at any point by manipulation of push buttons.

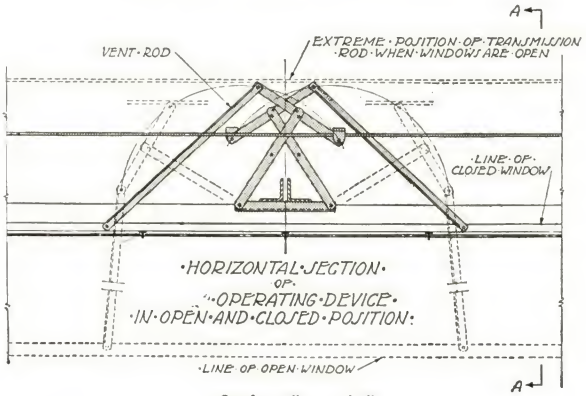
5. Limit switches shall be positive in action and rigidly attached to the power to form an integral part of the power unit. All limit switches shall be enclosed yet accessible for adjustment so as to positively limit the motion of the ventilator in either direction.

6. Push button stations "open," "close," and "stop" shall be of rugged construction to withstand hard usage. Buttons shall be recessed in cover so that they cannot be accidentally operated.

Electrical Construction



Note:—The following provisions should be made in the Electrical Specifications.



7. The Electrical Contractor shall install magnetic reversing switches and push button stations and shall furnish and install safety type, line switches. He shall also furnish all conduit, fittings and wire and do all wiring between the electrical equipment furnished by the Window Operator Manufacturer and that furnished by himself in accordance with the wiring diagram furnished by the Window Operator Manufacturer. All materials and workmanship shall meet the requirements of the National Electric Code and all Local and State Inspection Bureaus.

8. Conduit shall be galvanized or black enameled, approved by Underwriters' Laboratories, Inc. Wire shall be rubber covered N.E.C. Exposed conduit shall be run in a systematic, sightly manner, paralleled with structural features of the building and rigidly and neatly attached. Where walls are plastered conduit shall be concealed.

9. The Electrical Contractor shall carry fire, workmen's compensation, and public liability insurance. He shall guarantee his work for a period of one year after completion. Defects in the work and material furnished by him developing during the above named period shall be promptly and satisfactorily made good at his expense.

INDUSTRIAL DOORS

Lupton doors are built to withstand successfully the constant and ofttimes rough usage given them in buildings used for industrial purposes.

They are made in a wide range of sizes suitable for exterior and interior doors in all types of industrial buildings, power houses, warehouses, etc.

SPECIFICATIONS

Work Included

1. Furnish and install where shown on drawings, Steel Industrial Doors, manufactured by DAVID LUPTON'S SONS CO., Phila., Pa.

Material and Construction

Note:—Frames are not furnished for slide doors. Where frames are desired for swing doors, specify as follows:

2. Frames shall be furnished for swing doors where noted on plans (or as listed).

3. Frames shall be made of 4" structural channel. Top corners shall be bolted together by means of clips. Jambs shall be braced at bottom with structural angles to preserve square lines of frame during shipment.

4. All doors shall have 1½"x½" structural channel stops at head and jambs. Stops shall be attached to frames with round head self-tapping screws not over 9" on centers.

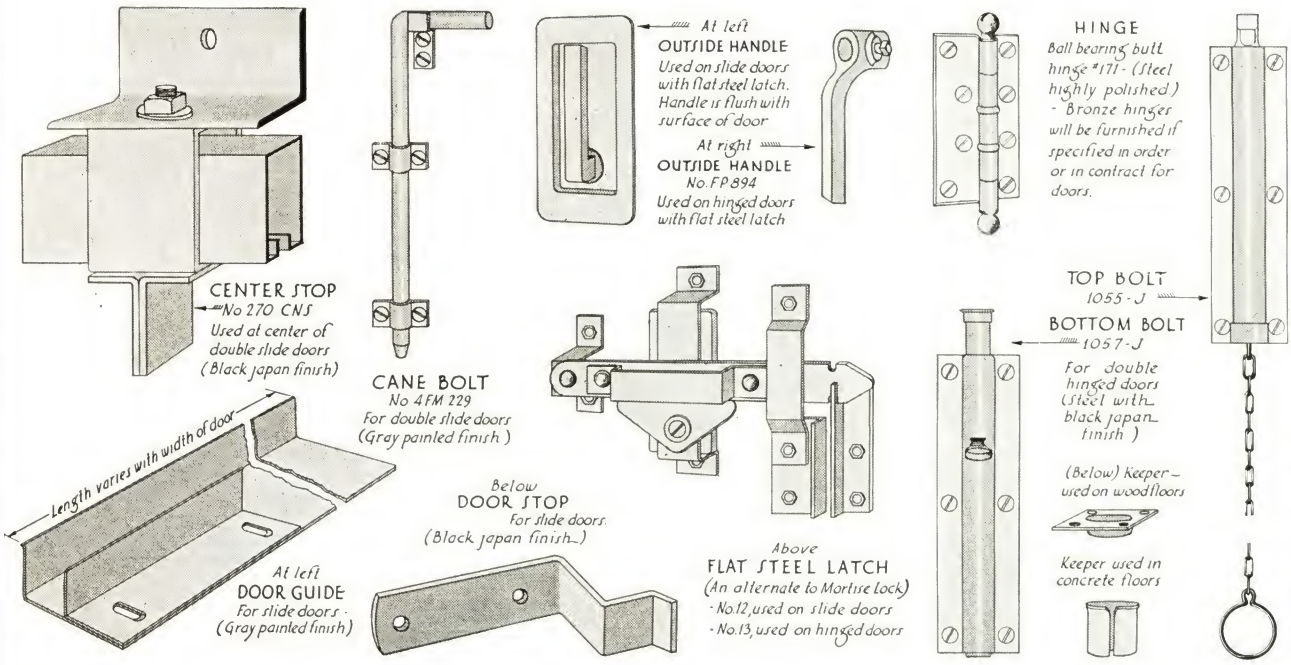
5. Anchors of $\frac{3}{16}$" steel plate bent in Z shape shall be attached to jambs of frame not over 3' on centers.

6. Doors up to and including those 10'0" in height shall have rails and stiles of 1½" x 2⅝" x 14 ga. welded steel tubing.

7. Doors over 10'0" in height shall have rails and stiles of 3" x 2" x 14 ga. welded steel tubing.

8. Rails and stiles shall be mitered at corners—welded and ground flush.

9. All doors shall have a 14 ga. steel panel insert in the lower part of the door and standard rolled steel window glazing panel in the upper portion, both panels to be attached to the rails and stiles by sheet metal screws.



10. Astragals of 14 ga. steel plate shall be furnished for double doors.

Hardware

11. Swing doors made of 1½" x 2⅝" tube shall have ball bearing butt hinges. Three hinges for doors up to and including those 8'0" high, four hinges for doors over 8'0" high. Swing doors made of 3" x 2" tube shall have strap hinges. Three per leaf.

Continued on next page→

HARDWARE

Illustrated above are standard hardware fittings (with the exception of tracks, hangers, etc., for hanging slide doors which are shown on page 93).

The following hardware is optional and is furnished if clearly specified and mentioned in order or in contract for doors:

(a) Mortise locks for swing or slide doors.

(b) Iron or bronze handles for mortise locks.

(c) Cylinder—one or both sides for mortise locks.

(d) Master Key systems for cylinders.

(e) Door checks, (f) Panic hardware, and (g) Bronze butt hinges.

In ordering locks always indicate hand and swing of door. See diagrams on pages 92 and 93.

All hardware wherever possible is fitted in factory and shipped unattached except in the case of single hinged doors with frames where frame, door and hinges are shipped assembled together.

SPECIFICATIONS for INDUSTRIAL DOORS

Continued from preceding page.

12. Tracks, track brackets and roller bearing trolleys together with adjustable door guides and door stops shall be furnished for slide doors.

13. Double slide doors shall have cane bolt on dead leaf. Double hinged doors shall have top and bottom bolts on dead leaf with suitable keepers, for installation in (state whether floor is wood or concrete).

14. Hinged doors shall be equipped with—specify (a) or (b),

(a) Flat steel latch and keeper with malleable iron handle on outside.

(b) Mortise lock furnished with malleable iron (or bronze) handles, cylinder and thumb latch.

15. Slide doors shall be equipped with—specify (a) or (b),

(a) Flat steel latch and keeper with flush handle on outside.

(b) Mortise lock with flush grip, cylinder and thumb latch.

Note:—The following hardware is furnished if clearly indicated on original drawings and in specifications and mentioned in contract for windows.

(1) Cylinder substituted for thumb latch.
(2) Master key systems.
(3) Polished bronze handles for swing door mortise lock.
(4) Panic hardware.
(5) Door checks.
(6) Bronze butt hinges.

Note:—All hardware wherever possible is fitted in the factory and shipped unattached, except in the case of single hinged doors with frames where frame, door and hinges are shipped assembled together.

Erection

(See page 3)

16. Lupton Steel Industrial Doors shall be erected by (state by whom) in accordance with details furnished by door manufacturer. Frames for swing doors shall be set plumb and square and securely anchored to the building construction. Slide doors shall be hung from tracks securely fastened to building construction. They shall be adjusted to give satisfactory operation. Hardware shall be applied according to door manufacturer's directions.

Note:—Where slide doors are hung outside on exterior wall flashing is required. This flashing is not supplied by Lupton.

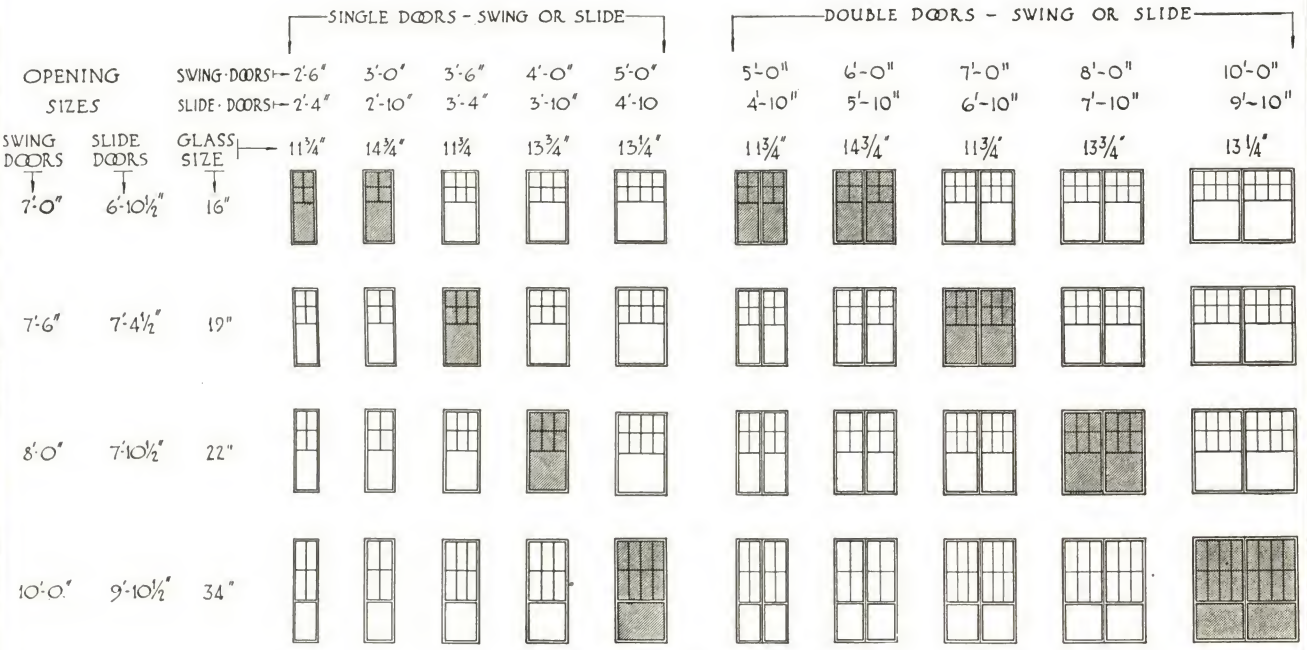
Painting

17. All doors shall receive one shop coat of door manufacturer's dark gray paint, oven dried.

Note:—See page 3.

Glass and Glazing

18. Glazing stops of ½" x $\frac{5}{16}$" rolled steel angle section shall be furnished, shipped attached.



Note:—(See also page 3.) Specify glass and glazing under proper heading elsewhere in specifications.

(a) Do not specify single thickness glass.

(b) Specify high-grade steel window putty (ordinary wood sash putty must not be used).

(c) Specify that Lupton Steel Industrial Doors shall be glazed from the inside; that the glass shall be set in a bed of putty and held by Lupton glazing and angle stops.

STANDARD TYPES AND SIZES

10'-0"	9'-10½"	34"										

The above diagram shows the standard sizes and types of door units. Shaded units are carried in stock. Units are used interchangeably as swing or slide doors. The dimensions given in diagram are opening dimensions as indicated on pages 92 and 93.

Glass is not included with the doors, but glazing angles are furnished, shipped attached.

Where doors larger than 10' x 10' are required it is economical to use if possible, doors of the following opening dimensions.

Swing Doors

Heights	11	12	13	14 and 15 ft.
Widths (single doors)	3	3½	4	5 and 6 ft.
Widths (double doors)	6	7	8	10 and 12 ft.

AIRPLANE HANGAR DOORS

These doors are built by skilled workmen to satisfy the exacting requirements of the airplane industry. Made in two types, Straight Slide Type and Around-the-Corner Type.

Sizes of Openings

Standard opening heights range from 12 to 30 ft. Larger doors of the same design can be furnished when required.

Width of a door unit approximately 10 ft. Hinged end units for use with around-the-corner doors, are approximately 4 or 5 ft. as required. It is desirable to make the total width of opening some multiple of 10 ft. (40, 50, etc.)

Construction

Doors are made of steel tubing (shown in detail) or structural steel channel as specified. All joints between frame members are solidly welded and the exposed part of the weld ground flush.

Pilot doors are provided where required. They are made of 1½ x 2⅝-in. steel tubing and are equipped with cylinder locks.

Glazing panels are glazed inside with putty. Glass is held by steel wire glazing clips.

Hardware

Weight of door is carried on two bottom rollers running on 16-lb. A.S.C.E. rails. Doors are guided at top by two double rollers bearing on a structural steel angle. Bottom rollers have Timken bearings and Alemite fittings for lubrication. A ball thrust bearing is used to pivot rollers for around-the-corner doors.

Slide doors are equipped with a wheel lock for locking door at any desired position. Cremone bolts are furnished for locking hinged end doors. Bumpers are furnished at end of tracks. Travel of doors is limited by stops at top of door.

CONSTRUCTION	CLEAR OPENING HEIGHT	CENTER TO CENTER OF TRACK
2½" x 2½" TUBE	12'-0" TO 18'-0"	5¼"
3" CHANNEL	12'-0" TO 18'-0"	6"
3" x 2½" TUBE	18'-6" TO 22'-0"	6"
4" CHANNEL	18'-6" TO 22'-0"	7"
4" x 2½" TUBE	22'-6" TO 30'-0"	7"
5" CHANNEL	22'-6" TO 30'-0"	8"

COMMERCIAL DOORS

Lupton Commercial Doors are designed for use as exterior or interior doors for garages, manufacturing plants, etc., where inexpensive steel doors are desirable. Lighter in construction than Industrial Doors, they are, within their size limits, a practical and economical product.

Sizes and Construction

Doors are made only in stock sizes shown below. Stiles and rails are made of 18 gauge steel, mitered and welded at corners of door and the welds ground flush. The lower part of door has a 16 gauge steel panel and the upper part is made to receive glass. Frames are furnished for swing doors only and only when specified. They are made of steel plate. Flat steel anchors are provided at jambs and an expansion bolt at head.

Hardware

All necessary hardware (shown below and on next page) is included with doors except Hook Back No. 101 which must be specified if required. In ordering swing doors specify whether Mortise Lock or Lever Latch is desired.

Erection

Door frames must be set plumb and square, securely anchored to building. Tracks for slide doors must be level and anchored securely. *(See page 3.)*

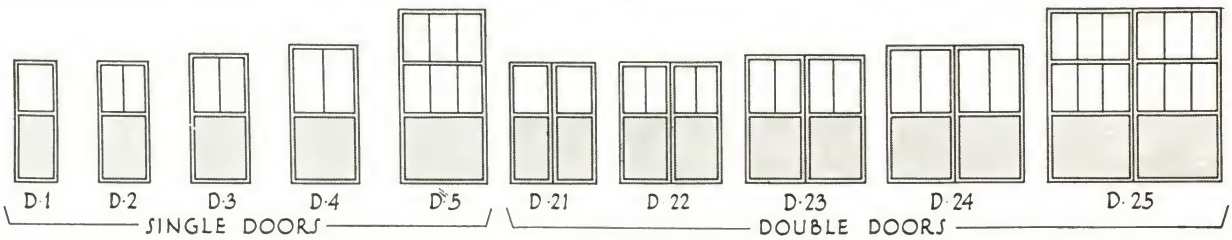
Swing doors are drilled in shop for hinges and when Lock No. 97 is ordered doors are mortised and drilled to receive it. All other drilling must be done in field.

Single doors with frames are shipped assembled in frames. Double doors are shipped separately from frames.

Glazing and Painting

See table below for glass sizes. Orders for doors do not include glass, but steel glazing stops are furnished, shipped attached. Always use steel window putty and glaze after doors are erected. *(See page 3.)*

Doors are given one shop coat of gray paint, oven dried.



Ordering

When ordering give the following information:

1. Symbol numbers of doors required (D-1, D-2, etc.).
2. Quantity of each type required.
3. Whether doors are to swing or slide and whether right or left hand. (See "Key for Hand of Doors" on next page.) If Swing Doors are ordered state also,
   a. Type of lock desired (No. 97 or No. 98).
   b. If frames are required, give Door Frame Marks (see table below).
   c. Whether or not Hook Backs are required.

CORRUGATED WIRE GLASS *by Lupton*

Lupton service in connection with Corrugated Wire Glass is based on a wide experience with installation of this type of skylight-roof covering. Wherever roof lighting is being considered, Lupton will be glad to co-operate by submitting tentative designs indicating practical and economical methods of applying skylights of Corrugated Wire Glass.

Corrugated Wire Glass is a translucent material which, if used as a covering for skylights, roofs and sidewalls, has definite advantages.

It transmits a finely diffused light with minimum glare and shadow.

It is easily erected and completely weatherproof.

Because of its corrugations it develops greater strength under uniform loading and greater resistance to vibration and temperature changes than any other type of sheet glass of equal thickness.

No skylight bars are used. The glass carries the load directly to purlins and curbs.

Maintenance cost is low because there are no bars to rust or corrode, breakage is practically eliminated and the corrugations permit rain to clean the glass.

It meets every requirement of the National Board of Fire Underwriters for fire retardment.

Corrugated Wire Glass is often used as a covering for the entire roof area of a building. It is readily applied to single or double pitch roofs, connected directly to any type roof covering. It can be used for sawtooth roofs, back slopes of Lupton V-type roof, sidewalls, marquises and canopies.

Specifications and Installation Details

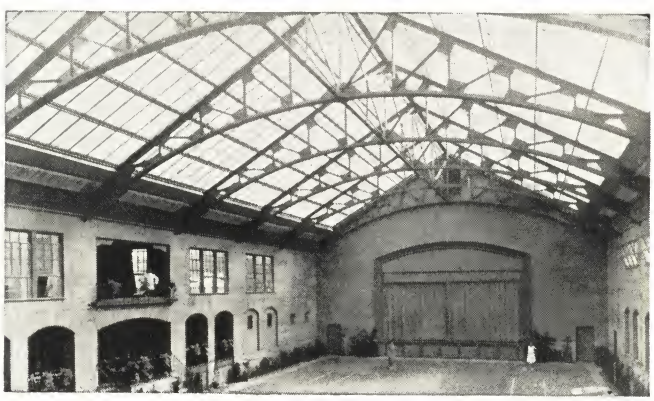
Specifications for Corrugated Wire Glass and details covering the more usual types of installations appear in another section of SWEET'S CATALOGUES under "Skylights." A folder containing additional roof details, details for Canopy and Marquise, Sidewall Construction and application of Roof Ventilators will be sent on request.

Draining Condensation

Condensation is readily disposed by means of drainage tubes, that conduct the moisture directly to the outside of the roof, or by using condensation gutters.

Actinic Glass

Actinic glass excludes much of the sun's radiant heat, thus reducing the summer temperature under the glass. Its use is advisable where reduction in sun's heat or glare is desired without sacrificing visibility.



(Upper left). Corrugated Wire Glass used over a swimming pool at the Fordson High School, Dearborn, Michigan, Van Leyen, Schilling and Keough, Architects. Notice that the usual wire guards have been omitted due to the resistance of Corrugated Wire Glass to breakage.

(Lower left). Corrugated Wire Glass was selected to withstand temperature stresses and vibration from cranes and to give better light diffusion at the plant of the General Steel Castings Company, Eddystone, Pa. Approximately 241,000 sq. ft. of Corrugated Wire Glass is used here. Cost of Corrugated Wire Glass permits its installation over extremely large areas.

The excellent light diffusing properties of Corrugated Wire Glass, its simplicity of construction, weathertightness and freedom from usual breakage recommends its use wherever abundant but perfectly diffused daylighting is a desired element in design.

(Below). Corrugated Wire Glass in the indoor tennis court for Mrs. H. E. Talbot, Dayton, Ohio, Peabody, Wilson and Brown, Architects.

LUPTON
STEEL PRODUCTS

OTHER LUPTON PRODUCTS not described in detail in this catalogue—Steel Partitions, Detention Windows, Steel Shelving, Textile Mill Equipment, Sheet Metal Products, Steel Factory Equipment, Retail Store Equipment, Steel Printing Equipment. The articles listed here and those described in detail in the foregoing pages are in no sense a limit to Lupton's ability to serve in the making of quality metal products. Our facilities are always available for making products to meet your particular requirements.

FOREWORD

LEMCO
STEEL
CASEMENTS

We specialize in high grade steel casements of any design or size. Our casements and doors may be divided into two general groups.

Strictly Custom Built Casements and Doors—These are made of No. 200 heavy three-point section and No. 600 heavy two-point section. They may be of any shape or size.

Standardized Steel Casements and Doors—Casements and doors are made of our No. 600 heavy two-point section in standard sizes and are kept in stock at all times for immediate shipment.

LEMCO QUALITY

Our casements are produced to conform to a high standard of both workmanship and material. The sections, which are unusually heavy, are made from hot rolled steel bars and are carefully straightened. The corners are accurately mitered and electrically welded together, making strong and neatly finished casements.

They are made by expert mechanics and all work is subjected to rigid inspection for precision of contact parts and assembly. The hardware, including hinges and fasteners, is made of bronze and not of malleable iron.

LEMCO HARDWARE

All hardware is solid bronze, even for the most inexpensive sash, and is made in our own foundry. Plates 1H-1, 1H-2 and 1H-3 show the designs of the various parts. Our patented safety cleaning friction hinge allows the outside of the glass to be cleaned from the room side and the friction feature does away with the use of a sill adjuster. The friction hinge is easily operated, yet it will hold the sash in any desired position.

LEMCO FINISH

All steel is thoroughly cleaned and brushed before painting. All custom built jobs receive one coat of rust resisting paint and one coat of gray enamel, each coat baked on separately; standardized casements receive only one coat of gray enamel. However, painting specifications may vary to meet conditions or architect's specifications.

Ariston Steel Windows

Ariston Steel Windows have been developed for every purpose, and have been designed with care to meet the demands of the most exacting Architects and Owners.

Ariston Residential Casements are obtainable in Standardized, Architectural Medium Section, and Standard Heavy Section constructions, giving wide selection in standard and special designs and construction.

Ariston Office Type Windows are also procurable in four grades to care for every condition of economy and design, manufactured in steel. Ariston also offers bronze and aluminum windows.

Ariston Commercial Windows of flat section construction offer the maximum of rigidity, weathertightness and rust resistance. This flat section is especially designed to eliminate rust pockets and simplify painting procedure.

Ariston Service

Ariston's policy is service. Our facilities permit delivery of either stock or special items with a minimum of delay.

Ariston service extends to all and is ready to answer questions and lend assistance wherever specialized expert advice is required.

Service, more than any other commodity, is demanded by the Builder and Architect. And justly so, for in scheduling work on a building it is highly essential to avoid costly delays.

Ariston Hardware

Ariston hardware is *solid bronze* (U. S. Government mixture). This insures lasting quality in the window installation.

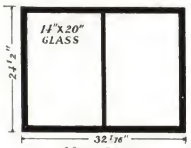
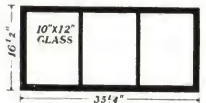
Milcor One-piece Steel Basement Windows

Frame—Stamped from a solid sheet and formed without a joint. A solid integral flange projects from jambs, sill and head into masonry for anchorage and weathering. An integral fin on inside of jambs guides mason when setting the window and insures against fouling the sash.



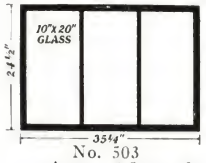
Sill—Special design provides protection against driving rain. Sill section slopes sharply downward and outward. Sloping and rounded corners prevent driven rain entering. At jambs, inside edge of frame is slightly turned in over sash providing further protection.

Sash—Formed in one piece, including hinge sections. Only glazing bars spot-welded in place. Glazing done from inside. Putty bed rests on channel formed when stamping sash. All Milcor steel sash are interchangeable in like frame sizes.



Lock—Type regularly used for double hung sash. Lever end is drilled for chain to hold window open.

Hinges—Cotter pins used for hinge coupling. Insures against unhinging as with open type hinges and makes sash easy to remove.



Bulletin—Write for bulletin giving complete description.

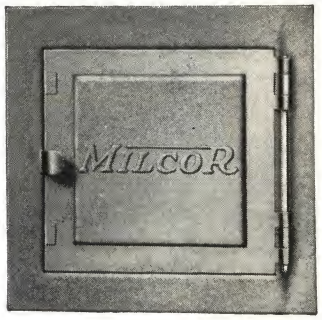
Screen frame screws tightly to window frame on outside, and is quickly secured in place or removed



Milk and Package Receiver

Milcor Milk and Package Receiver

Milcor Milk or Package Receivers are made from the highest grade of copper alloy steel sheets stamped and drawn. The hinges are integral with door and frame, no riveting or welding being employed. They are unbreakable and will last forever. These containers will hold 6 or more quart bottles of milk, depending on the thickness of the wall in which they are installed. They consist of two frames and doors connected by an adjustable body sliding upon itself, permitting the necessary adjustment when installing. Locks or catches are of wrought steel and unbreakable.

Flue or Clean-out Door

Like the milk or package receivers these clean-out doors are stamped from heavy copper alloy steel sheets. Hinges are integral with frames and doors and no riveting or welding is employed. Catches are of wrought steel. The whole is unbreakable and everlasting.

Flue or Clean-out Door

ESTABLISHED 1884

THE PHILADELPHIA SUPPLIES CO., INC.

SUCCESSORS TO P. DEISSLER & BRO.

All-metal Window Frames and Pivoted Window Ventilators

1741 North Sixth Street, PHILADELPHIA, PA.

Products

Sole manufacturers of the P. Deissler & Bro. patented PIVOTED VENTILATORS; METAL FRAMES for church windows and the leaded glass trade.

BASEMENT WINDOW VENTILATORS for masonry or wood construction.

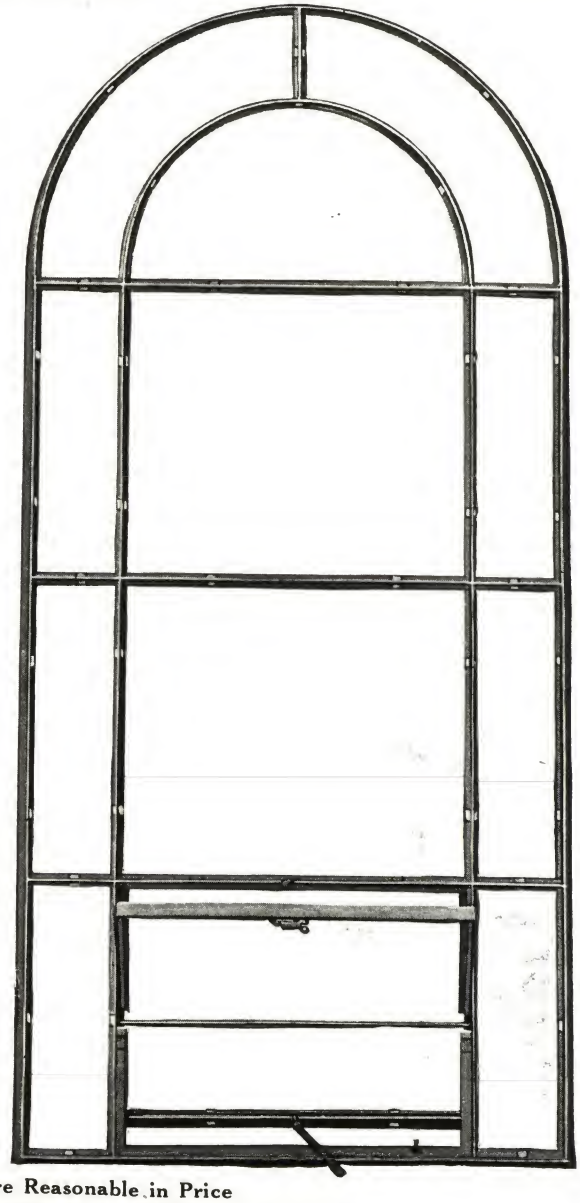
Also Skylights, Domes, and all other kinds of wrought iron work used in the leaded glass trade.

Improved Type All-metal Built-in Window Frames

Frames are made of steel or wrought iron as desired; finish is either painted or galvanized. They are built in as the building is in course of construction and make a rigid and everlasting weatherproof job. They are made in all styles—square, round or gothic top, and in any size or weight material desired. Used for leaded, plate, wire, ribbed or prism glass. They can also be furnished in brass, bronze and aluminum.

Frames are made for storm glass outside and leaded glass inside or for single glazing.

Ventilators can be put in the top, center or bottom of frames, and the inside swinging frames can be removed for glazing.



"Deissler" Improved Pivoted Ventilators

These ventilators have been specified for over 40 years as the standard church window ventilator. They are made of steel or wrought iron angles for single or double glazing and can be used for leaded, plate, wire, ribbed or prism glass. The inside frame of ventilators can be taken out and bars put in to suit the design. Finish is either painted or galvanized.

Where ventilators are in reach they are provided with spring lock at the top and lug at the bottom with strap for adjusting extent of opening. Ventilators out of reach should be specified with bottom heavy, self-closing; these are for the intermediate and bottom sections of windows. They are equipped with lock, pulley, bracket and chain fastener attached to the ventilator and are operated from the side with a chain. This eliminates the objection of cords or chains obstructing the design or view of the window.

Ventilators can also be furnished in brass, bronze and aluminum.

Two Designs of Frames That Are Reasonable in Price

We also make special designed metal frames—any style, size or weight material desired

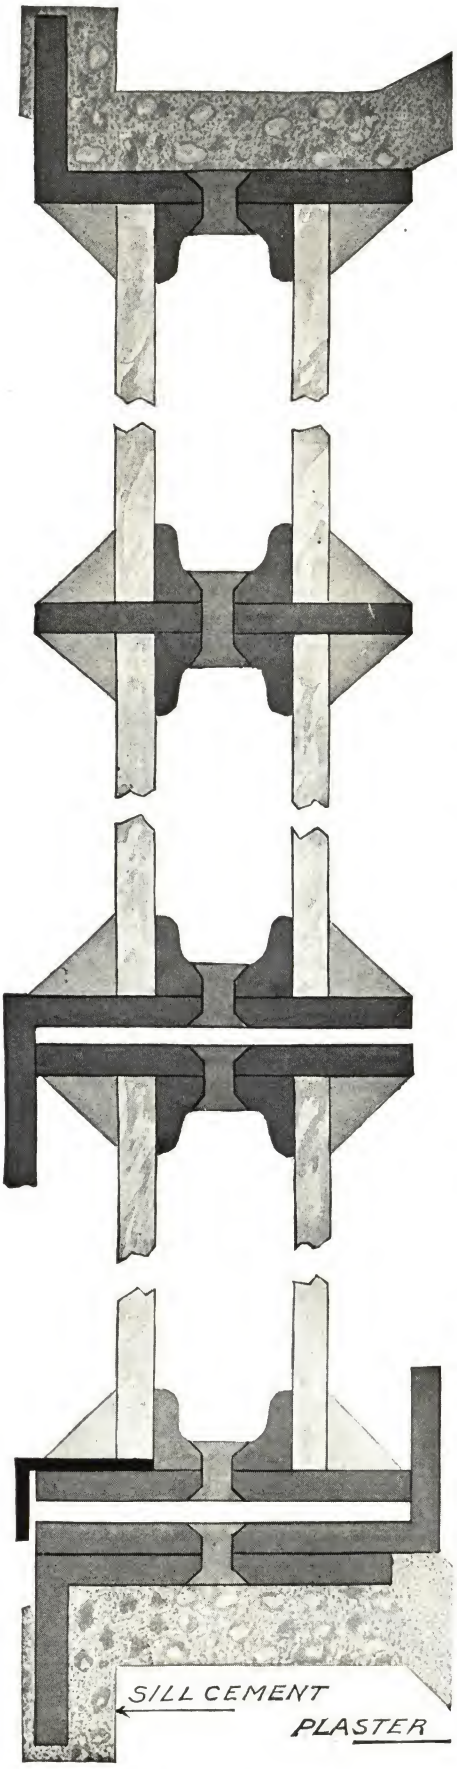


Fig. 1—Sectional View
(Full size)

Fig. 1. Sectional View (Full Size)

Illustrates a section of a metal frame for outside storm sash and inside leaded glass glazing. The double bottom ventilator shown is pivoted in the center to swing in at the top. Specify Catalogue No. 10 for double bottom ventilators where operation of sash is by spring lock at top and adjusting lug at the bottom; for the bottom heavy self-closing type adjusted by chain at the side, specify Catalogue No. 38.

Fig. 2. Sectional View (Full Size)

Illustrates a section of a Te-iron metal frame for single glazing. Type illustrated is for building into masonry openings but it can be made with angle iron all around and screwed into rough wood openings. Can also be used where wooden frames have a rabbet in which case the angle iron on the outside is not required as the frames have turned ends on the mullion bars which can be screwed direct to the wood.

The ventilator is also for single glazing and pivoted in the center to swing in at the top.

Specify Catalogue No. 1 ventilator for the bottom; No. 2 for the middle, and No. 3 for the top. Hardware can be furnished the same as described for the Nos. 10 and 38 Double, Double Bottom Ventilators described above.

Information Required for Estimates

All-metal Window Frames — Send blue prints and specifications with list of bidders. Any charge for these will be gladly remitted.

Pivoted Window Ventilators—The quality of ventilators and style wanted; and if for leaded glass, give bar sizes.

The sizes should be taken from the outside of angle iron, giving the width first, then the height. For rabbeted work, sizes should be taken full size.

In grooved mullions or jambs, the sizes should be taken daylight size.

State if ventilators are to be placed in top, middle or bottom of window, and if they fit in wood all around; and, also, if they are to be painted or galvanized.

For domes, skylights or iron work, send sketches.

Sizes, shapes and quantities vary so considerably, that it is impossible for us to issue a reliable price list. We will be glad to prepare a special estimate on receipt of specifications and quantities.

Patented Jan. 25, 1927

No. 38 Bottom Heavy Self-closing Ventilator

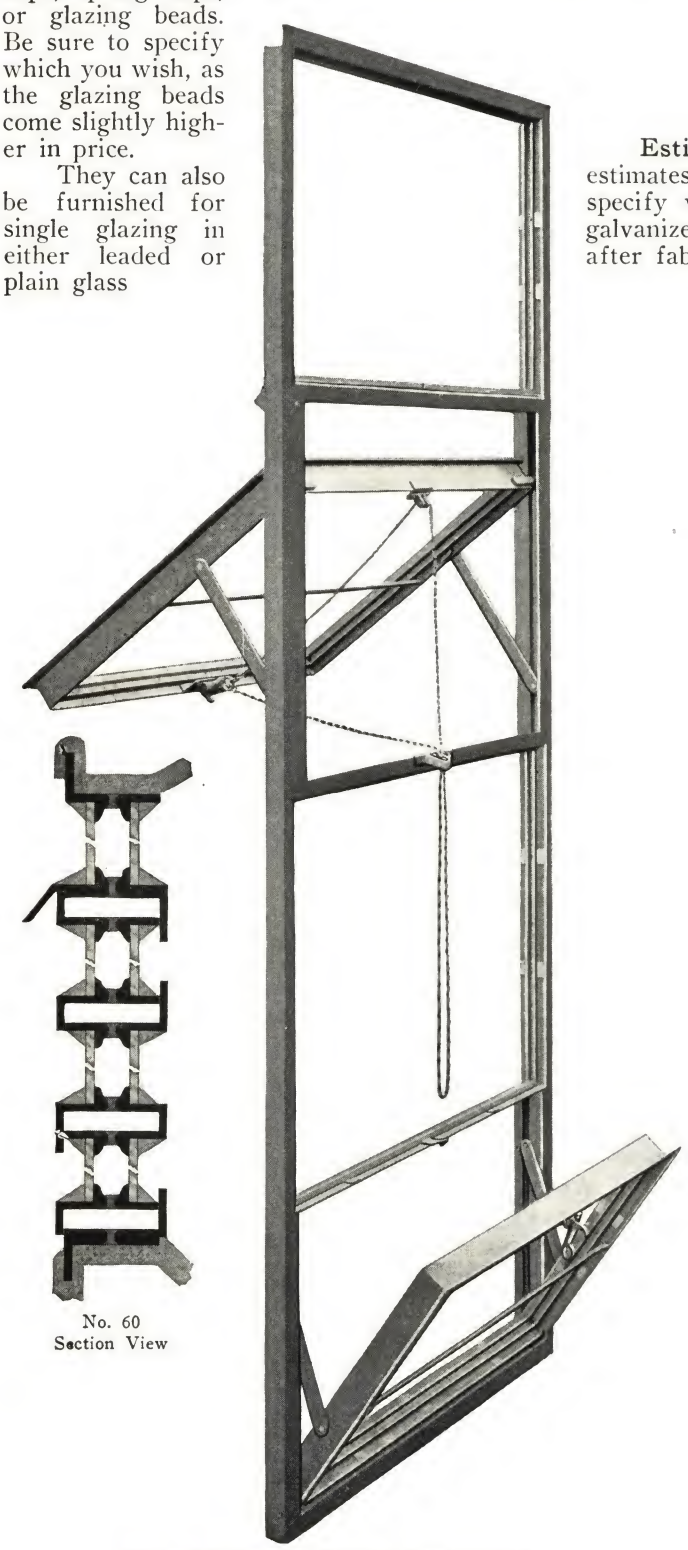
Details of P. Deissler & Bro. Pivoted Ventilators and Metal Frames

The Improved Projection Type, Built-in Window Frames and Ventilators for Public Buildings and Churches

No. 60 Frame for Double Glazing—The No. 60 frame is our improved built-in steel frame with the projection type ventilators. Most adaptable for double glazing—for leaded glass inside with storm glass on the outside. Projection ventilators can be made to project outward or open inside.

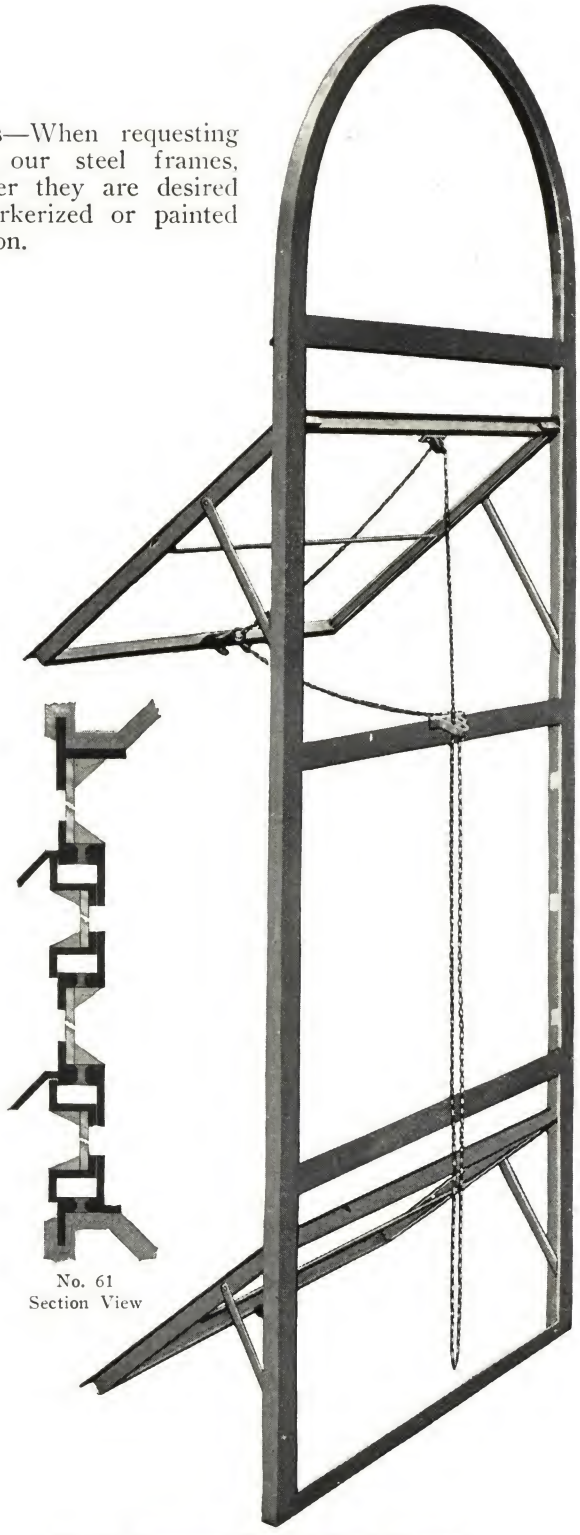
The frame and ventilators are absolutely weatherproof. They can be arranged to hold glass with glazing clips, spring clips, or glazing beads. Be sure to specify which you wish, as the glazing beads come slightly higher in price.



They can also be furnished for single glazing in either leaded or plain glass

No. 61 Frame for Single Glazing—The No. 61 frame is our improved built-in steel frame with projection type ventilators. Most adaptable for single glazing.

The frame and ventilators are absolutely weatherproof.



Frame can be furnished in either round top gothic head or square.

Estimates—When requesting estimates on our steel frames, specify whether they are desired galvanized, parkerized or painted after fabrication.

STANDARD TYPE DOUBLE HUNG WINDOWS

University of Montreal, Montreal, Canada

ERNEST CORMIER, Architect — DAMIEN & BOILEAU, Contractors

Nearly 5700 Integral weatherstripped "Standard Type" double hung steel windows installed in this building. This we believe to be the largest double hung metal window contract awarded in the British Empire

A Pioneer Manufacturer of Metal Windows

The S. H. POMEROY CO. INC., is a pioneer manufacturer of metal windows. It has been engaged in perfecting window design and adaptability for over 30 years, during which time many prominent installations have been made. It now offers its—

"Standard Type" Double Hung Window

Rust-resisting Metal—This window is made throughout of hot dipped galvanized copper-bearing steel. It is painted with a special galvanized iron primer made to our order.

Note: Committee A-5 American Society for Testing Materials:

"We have now reached a point where we may definitely conclude that copper-bearing metal shows marked superiority in rust-resisting properties as compared to non-copper-bearing metal of substantially the same general composition . . . under atmospheric exposure."

Distribution of Metal—Structural and wearing portions of frame and sash of 14 and 18-gauge metal, viz.: sill, 14-gauge; pulley stiles, head and sash stiles, 18-gauge; jamb boxes and rails of sash, 20-gauge.

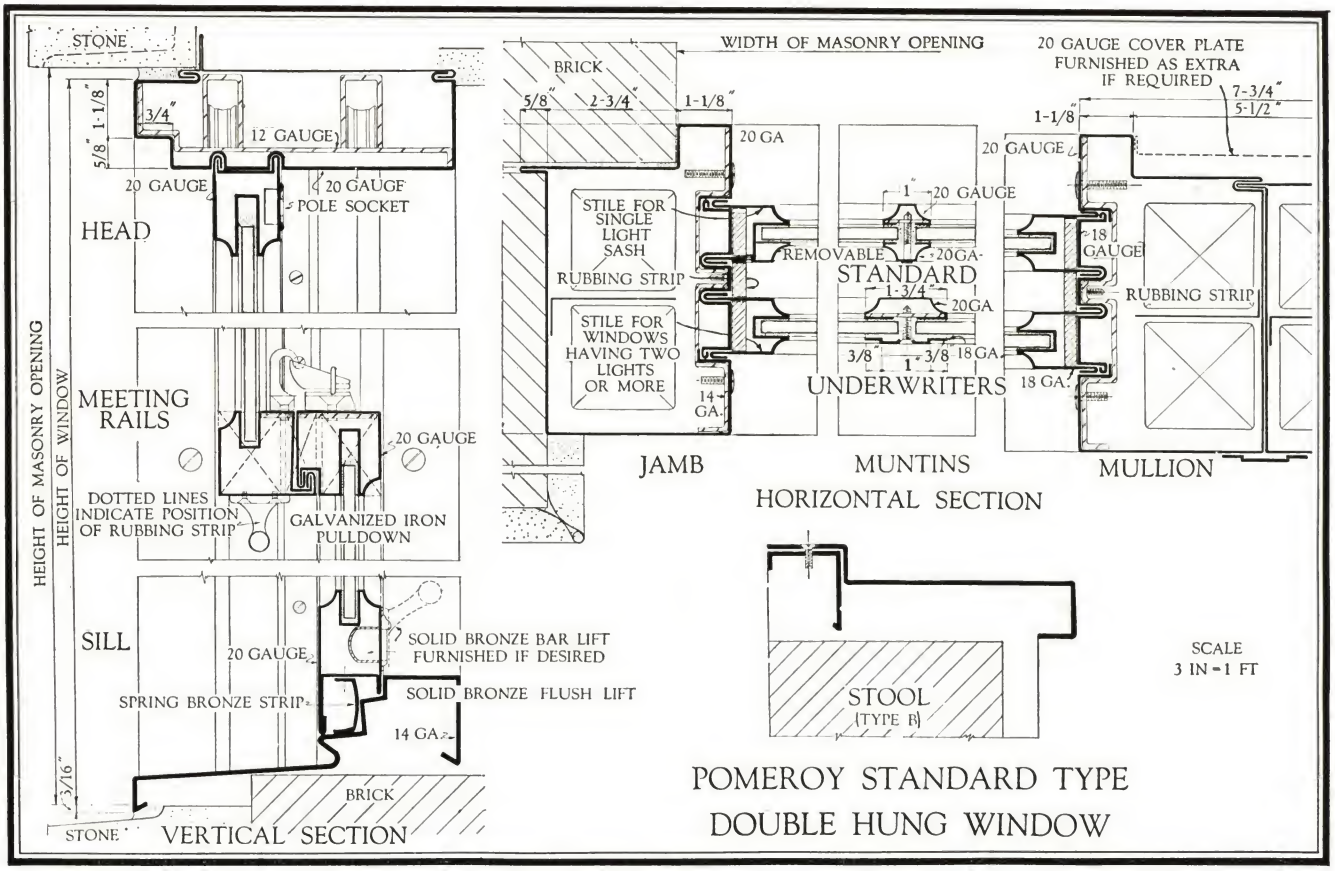
Weathering—Two-point contact inside and out entire perimeter of both sash, making double weathering.

Light—Due to small sash and frame members, maximum sight glass area is obtained. Width of standard muntin 1 in., Underwriters' muntin 1¾ in.

Appearance—Compare the slender lines, the simplicity, dignity of design and workmanlike finish with other metal windows. Note the absence of rivet and screw heads, bolts, etc. All exposed screw heads on interior are countersunk.

Economy—In the "Standard" window we offer to the building public, wherever located, a double hung metal window of unsurpassed merit and at a price so surprisingly close to wood windows that their use must now become universal.

Sample Window on display at Architects Sample Corp., 101 Park Avenue, New York, N. Y.



Air Infiltration

This window has been designed and constructed with the idea of insuring against excessive infiltration of air.

Subjected to test made at the University of Wisconsin by Professors Edward Anderson and G. C. Wilson, under the supervision of Professor G. L. Larson, in a manner similar to that described in the Journal of the American Society of Heating and Ventilating Engineers, June, 1924, the amount of infiltration of air through a standard double hung window proved to be less than two-thirds of a cubic foot of air per foot of sash perimeter per minute when subjected to static air pressure equivalent to air pressure exerted by a wind of twenty-five miles per hour.

This minimum amount of infiltration of air is accomplished without any added weatherstripping, device or appliance, with their additional cost.

This amount of air leakage is not discernible to a person standing on the room side of a window without the aid of a mechanical recording instrument.

Specification for Standard Type Double Hung Metal Window

Scope—Furnish and install, where shown on drawings, double hung Standard Type windows as manufactured by S. H. Pomeroy Co. Inc., of New York City.

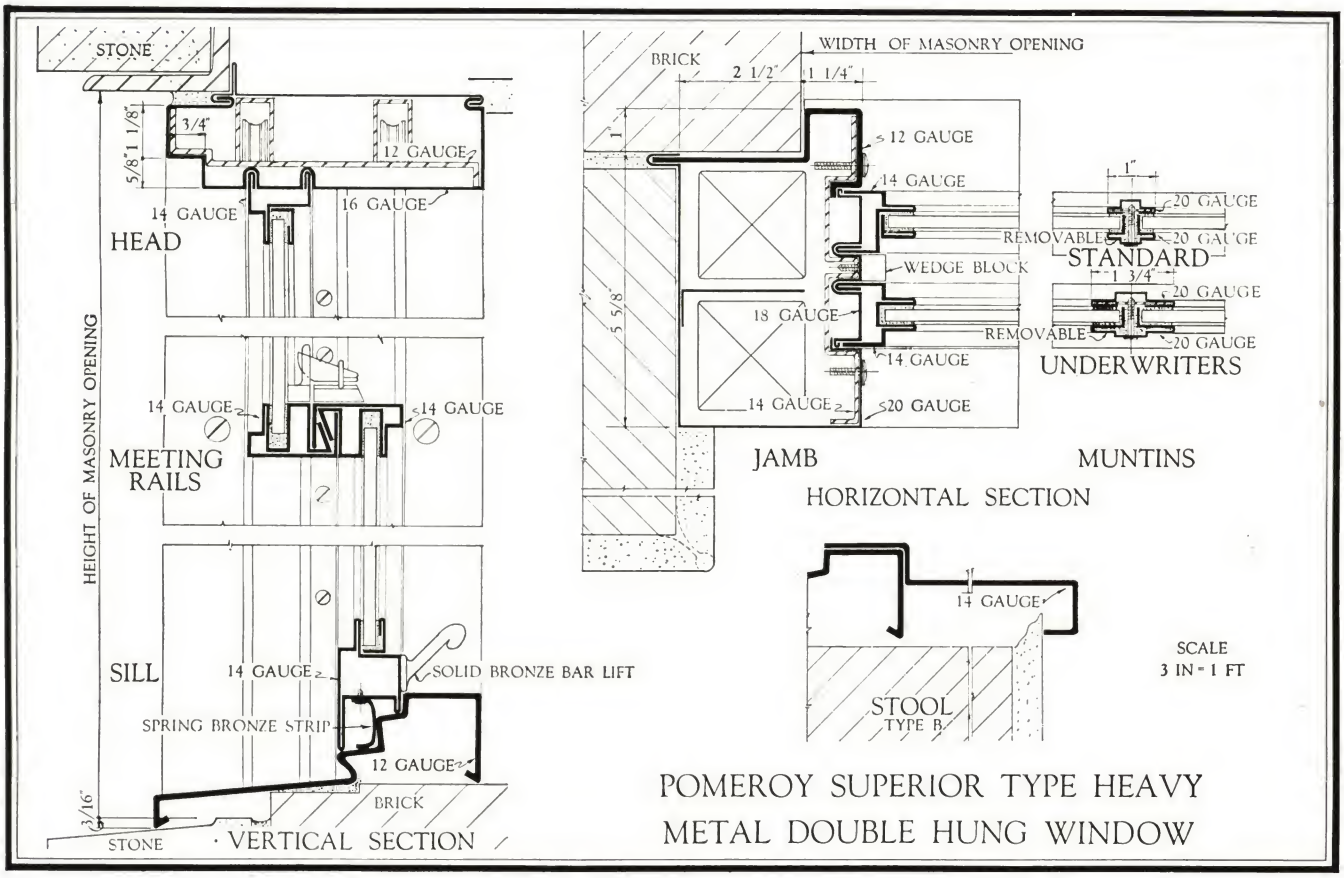
Material—All windows to be constructed throughout of copper-bearing hot dipped galvanized steel. Sills shall be of 14-gauge, jambs of 20-gauge, pulley stiles 18-gauge, heads 18-gauge, side rails of sash and inside muntin caps 18-gauge, cross rails of sash 20-gauge.

Frame Construction—Head, sill and jambs shall be rolled and formed as shown of one piece of metal, exclusive of pulley stiles and closure strips at head. All members shall be formed straight and true, neatly mitered, lapped and properly interlocked to their respective intersecting parts. The hanging stile shall be flat and 1⅛ in. in width. The interior jamb face shall be flat and 3⅜ in. wide. Depth of frame from inside to outside of hanging stile shall be 6⅝ in. Pulley stiles shall be formed with deep weathering grooves and shall be removable to permit of access to weight boxes and pulleys, and held in position by flat head countersunk screws. These screws, and two others on each jamb face, shall pass through heavy reinforcing plates spanning the inside of jamb box. With the exception of these screws no other screw heads, nuts, bolts or rivets shall appear on frame.

Sash Construction—Sash shall be moulded and of tubular design 1¼ in. thick. Stiles shall project not more than 1¼ in. beyond the inner face of the jamb, making the total distance from masonry jamb to sight line of glass 2½ in. Stiles and rails shall be constructed of one piece of metal moulded and neatly mitered, lapped and properly welded and interlocked. Side rails shall be of open construction with each flange being formed with a returned edge projecting into and operating in the weathering grooves of pulley stiles. Top sash rail shall be formed with flanges which shall engage in weathering grooves in soffit of the head. The bottom rail shall be equipped with a spring bronze weatherstripped member as shown making positive contact between same and sill. Meeting rails shall not be more than 1¾ in. deep and constructed with flanges forming interlocking contact. Glass rabbets in side and bottom rails shall be ¾ in. deep. Those occurring in top rails of upper and lower sash shall be 1⅜ in. deep. Where sash are to be glazed with one light of glass, side rails shall be constructed with removable inside glazing beads which shall be held in place with flat head countersunk machine screws.

Muntins—Exterior muntin bar shall be moulded and reinforced with 14-gauge steel lugs. Interior caps shall be flat or moulded and held in place by flat head countersunk machine screws passing through the reinforcing lugs of exterior member.

Hardware Equipment—Frames shall be equipped with solid steel bronze bushed pulleys, contained in 12 and 14-gauge steel housings. Sash shall be hung on substantial sherardized steel sash chain and properly counterbalanced by cast iron weights. Sash shall be equipped with one pair of projecting or flush bronze lifts, one malleable iron bronze plated sash lock. One bronze pull down on lower rail of upper sash or pole socket in top rail of upper sash.



Painting—Frames and sash throughout shall be given one shop coat of manufacturer's specially prepared metallic primer baked on before delivery.

Note: If Underwriters' label is desired the following should be incorporated: "Windows shall be constructed in accordance with requirements of the National Board of Fire Underwriters and shall bear their label of approval, as well as label of the manufacturer."

Note: If it is desired to construct this window of bronze, please write for specification, giving gauges of metal, etc.

POMEROY SUPERIOR TYPE DOUBLE HUNG WINDOW

New Heavy Metal Window—Pomeroy announces its new houble hung *heavy metal* integral weatherstripped "Superior Window." A window architecturally correct in design and appearance, affording maximum light and ease of operation. "The Aristocrat of the Window World"—which hesists *time, wind, water, dust* and *fire.*

Specification for Superior Type Heavy Metal Double Hung Window

Scope—Where shown on drawings, windows are to be Double Hung Heavy Metal Integral Weatherstripped "Superior" Type, as manufactured by S. H. Pomeroy Co., Inc., New York, N. Y.

Material—All windows to be constructed throughout of copper-bearing hot dipped galvanized steel. The sill, hanging stile and exterior wall face of jamb box shall be of 12-gauge, head 16-gauge, pulley stiles 18-gauge, interior jamb box 20-gauge, stiles and rails of sash 14-gauge, muntin bars and caps 20-gauge.

Frame Construction—Head, sill and jambs shall be rolled and formed as shown of one piece of metal, exclusive of pulley stiles and closure strip at head. Sill to be of the easy cleaning type, formed as shown with two vertical risers making three-point contact with sash rail, and in addition to have undercut wash to quickly dissipate water. All members shall be formed straight and true, neatly mitred, lapped and properly interlocked to their respective intersecting parts. Hanging stile shall be flat and 1¼ in. width. Interior jamb face shall be flat and 3⅞ in. wide. Depth of frame from inside to outside of hanging stile shall be 6⅞ in. Pulley stiles shall be formed with deep weathering grooves and shall be removable to permit of access to weight boxes and pulleys and held in position by flat head countersunk screws. These screws and two others on each jamb face shall pass through heavy reinforcing plates spanning inside of jamb box. With exception of these screws no other screw heads, nuts, bolts or rivets shall appear on the frame.

Sash Construction—Sash shall be rolled straight and true, forming moulded design 1¼ in. thick. Stiles to project not more than 1¼ in. beyond inner face of jamb to sight glass line. All sash members shall be made of one piece of metal neatly mitred, lapped and properly welded and interlocked, making a workmanlike finish. Sash stiles shall be of open construction as shown with the metal of the weathering flange returned upon itself affording a rounded traveling surface engaging and operating in deep weathering grooves of pulley stiles. Top sash rail shall be formed with flanges which shall engage in weathering grooves in soffit of the head, and bottom rail shall be equipped with a spring bronze weatherstrip member as shown, making positive contact between same and sill. Meeting rails shall not be more than 1⅛-in. depth forming an interlocking 3-point contact type. Glass rabbets in stiles and rails of sash shall be not less than ¾ in. deep. Where sash are to be glazed with one light of glass, the glass shall be held in place by, and sash members so constructed to receive, inside glazing beads, which are to be held in place by clips, eliminating use of screws.

Muntins—Exterior muntin bar and interior cap shall be rolled straight and true and moulded as shown. Exterior bar being reinforced with 14-gauge steel lugs and the interior cap held in place by 19/24 oval head machine screws passing through the reinforcing lugs of the muntin bar.

Hardware Equipment—Frames shall be equipped with solid steel self-oiling bronze bushed pulleys contained in 12 and 14-gauge steel housings. Sash shall be hung on substantial sherardized steel sash chain of standard manufacture and properly counterbalanced by cast iron weights. Sash shall be equipped with one pair of solid bronze projecting type lifts, one solid bronze sash lock and one bronze pulldown on lower rail of upper sash, or pole socket at top rail of upper sash—with exception of where windows are to bear the Underwriters' label of approval, then the sash locks are to be malleable iron bronze plated.

Painting—Frames and sash throughout shall be given one shop coat of manufacturer's specially prepared metallic primer baked on before delivery.

Note: If Underwriters' label is desired the following paragraph should be incorporated:

"Windows shall be constructed in accordance with requirements of the National Board of Fire Underwriters and shall bear their albel of approval, as well as label of the manufacturer."

Note: If it is desired to construct this window of bronze, please write for specification.

BROWNE WINDOWS OF COPPER BEARING STEEL, EXTRUDED ARCHITECTURAL BRONZE AND EXTRUDED ALUMINUM ALLOY

Fireproof, Weatherproof and Dustproof

Operation of Browne Windows—Built on principles that produce positive results in operation and in overcoming air leakage. The windows may be in groups of one or more pair of sash as desired.

Browne Fire Windows—Same in general appearance, and bearing labels of Underwriters' Laboratories, Inc.

Browne Psychiatric Type Windows—With tee-bar muntins and stops to limit opening. These eliminate need of restraint bars or guards.

Other Types of Browne Windows—These windows are made in a wide range of types and sizes appropriate for office buildings, hospitals, school and university buildings, public buildings, department stores, industrial buildings, apartments, hotels, homes, etc.

Samples—Browne Windows are on display at the following places:

Architects' Samples Corp., New York, N. Y.
Architects' Exhibit Corp., Boston, Mass.
Architects' & Builders' Exhibit, Buffalo, N. Y.
Architects' Exhibit, Inc., Cleveland, Ohio.
Architects' Exhibit, Inc., Detroit, Mich.
Metropolitan Builders' Exhibit, Seattle, Wash.

GENERAL DESCRIPTION OF BROWNE WINDOWS

Sash are firmly hinged together to open (outwardly) and shut under symmetrical control of hinged arms attached to a stationary vertical bar. The arms afford absolutely rigid support. A simple catch fastens sash when window is closed.

Heavy felt weatherstripping is an integral part of the construction.

Every window is assembled at factory, tested for accuracy and shipped a complete unit including weatherstrips.

Browne windows require no special skill for setting and are readily glazed after installation.

Hardware—Furnished by us. Bronze handle shipped loose to be applied at the job by contractor.

Glass—Should be furnished and set by glazing contractor.

Painting—All steel parts receive one shop coat of paint before shipment.

All finishing coats should be applied by the painting contractor.

BROWNE WINDOW ADVANTAGES

Maximum Light and Vision—Sash are continuous from sill to head with no obstruction from horizontal meeting rails.

Ventilation—Ideal changing of air without drafts. The sash control forms flue that draws out all impure air, which is automatically replaced with fresh air. A pleasant quality of ventilation is obtained by bowing sash open to maximum of seven or eight inches. This gives fresh air intake at bottom, exhaust at top, with no opening at sides.

Weather Protection—The airtight and dustproof qualities of the windows have been established under laboratory test.

Noiseproof—Thick felt contact cushions practically shut out street noises when window is closed.

Safety—All parts of the sash are accessible from the inside. The expense and danger of outside window cleaning and painting are eliminated.

Simplicity—No track mechanism for the accumulation of dirt and water. No weight boxes to invite drafts and annoyance from noise; no chains, weights or pulleys to get out of order; no rattling of parts when open or closed.

Contact—No metal to metal weathering contact. The contact in all cases is metal to felt.

Service—Continuous and lasting, with no danger of sagging, warping, racking or wearing off paint.

Operation—Smooth, easy, noiseless; with slight physical effort the sash may be opened to any desired angle. Releasing catch handle, pushing sash partly open and a slight pull at the edges of sash towards center opens window full extent. Pushing edges of sash away from center brings handle within easy reach for closing and locking. The handle is a most convenient latch attachment and is intended for this use only. Where windows can not be reached from the floor, our standard

operator may be applied, locking window in any position.

Strength—All parts are sturdy and substantial; the greatest care is taken in the construction and assembling to insure rigidity and permanence.

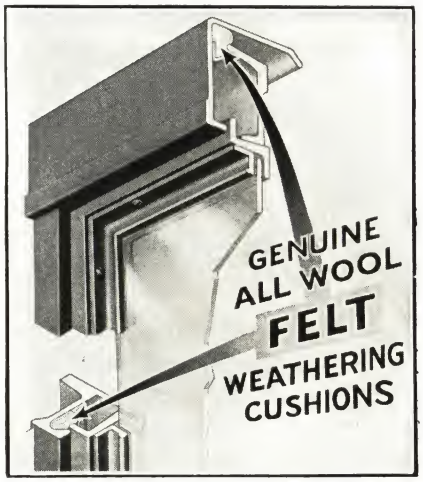
Curtains, etc.—Curtains, shades, Venetian blinds, and inside screens may be applied as for ordinary sash.

Economy—Minimum cleaning and maintenance costs; assurance of maximum results from heating arrangements; and fuel saving due to dependably tight openings are prominent features.

SPECIAL FEATURES OF BROWNE WINDOWS

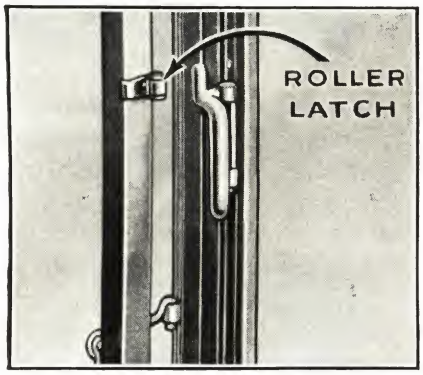
Felt Weathering Cushions—Permanent, resilient, waterproof, pure wool felt weathering cushions securely held and cemented in deep recesses. A metal to metal weathering contact can never develop. All weathering contacts are, and will remain, metal to felt. Rubbing contacts cannot develop. All are butt contacts with sash members deeply seated into felt cushions.

Roller Latch and Handle—Made of bronze for steel and bronze windows; of aluminum for aluminum windows. The handle is located on the sash at convenient height and engages with a free operating roller latch secured to center bar. These insure easy locking of the window with nothing to get out of order.



Holdfast Hooks—Three staunch holdfast hooks are located within easy reach and are designed to hold sashes open in bowed position at varying degrees as required by weather conditions. With these hooks engaged, there is air intake at bottom, exhaust at top, and no openings at sides.

Guide Members and Rails—Guide rails are located at head and sill members of frame and rustproof guides are secured at each outward corner of sashes, making contact with guide rails. These are permanently adjusted at factory to secure ease of operation without rattling.



Center Bar, Hinge Arms and Butt Hinges, the Essence and Individuality of the Browne Window—The frame is of specially designed sections with a substantial center bar to which the drop forged hinge arms are attached. The ends of these hinge arms are pivotally attached to the center of the sash rails top and bottom. The two sashes are hinged together with heavy butt hinges.

This assembly gives perfect and permanent alignment and symmetrical control of the sashes. These features are the *essence* and *individuality* of the Browne Window principle.

Standardized Industrial Windows and Doors

As members of the Solid Section Steel Window Industry (listed in Manufacturers' Index), we manufacture our commercial products in conformity with the standardization and simplification program of the United States Department of Commerce. This standardization expedites service and greatly reduces the cost of producing steel windows of the highest quality.

Specialized Windows and Doors

In the following pages we have attempted to give sufficient data about some of our specialized windows to enable the architect and the builder to select the types most suitable to their purposes. In addition to the information given here we have prepared a number of special catalogues, illustrated with photographs and drawings of typical installations, that give complete detailed information about all our products in each classification. These catalogues will be furnished on request.

In construction of distinctive character our engineering staff, through years of practical experience in meeting varied problems of the building industry, can often provide information that greatly facilitates the preparation of plans. This cooperation is always at your command.

Protection of Products

Before shipment all Soulé Windows and Doors are given a shop coat of high grade paint to protect the products until they are installed. After installation, we recommend that at least two coats of high quality mineral paint be applied by the painting contractor. Hardware is boxed securely and shipped with the units to which it is to be applied in the field.

Erection

We strongly recommend that we erect all important installations of our products, particularly specialized items. Our erection service is available throughout the country.

Standardized products may be installed without difficulty by any builder. We will furnish installation details free of charge with any of our products.

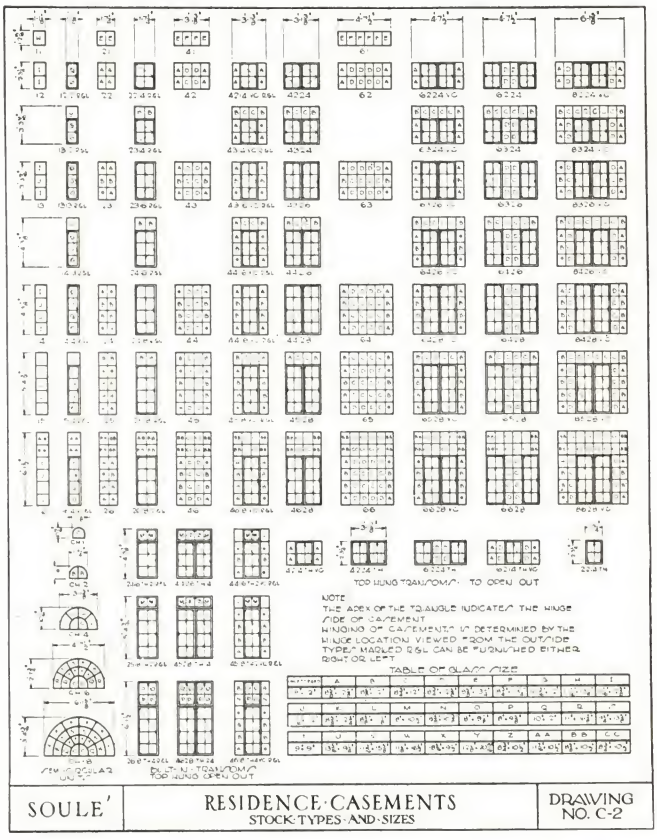
Glazing

Proper glazing of steel windows is a very important part of any satisfactory installation. Special steel window putty must be used to insure correct setting and strength. We recommend tinting the putty with dry colors instead of painting its surface. Spring wire glazing clips are furnished with all Soulé Windows unless screwed on glazing angles or beads are specified.

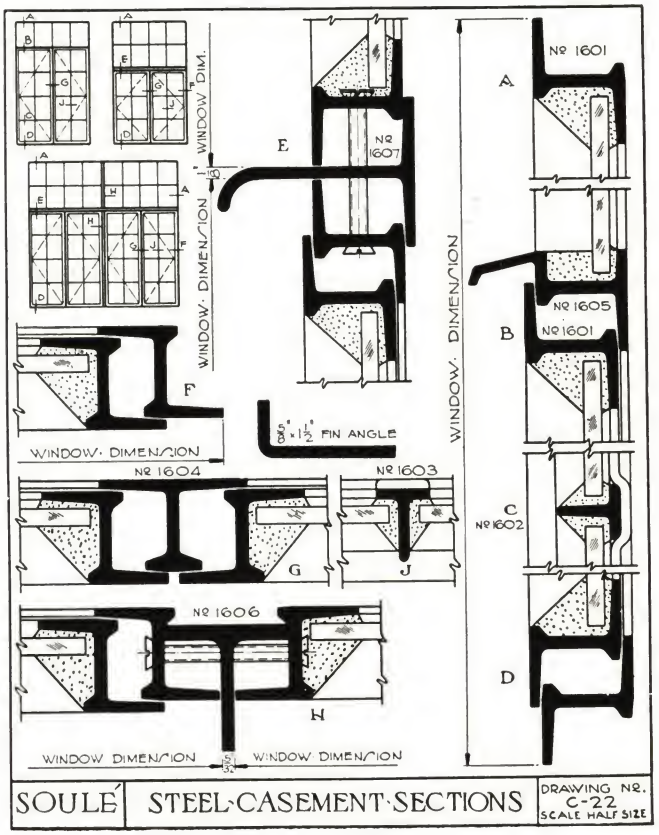
Screening

Efficient screens for commercial projected windows are manufactured by Soulé Steel Company to the following specification:

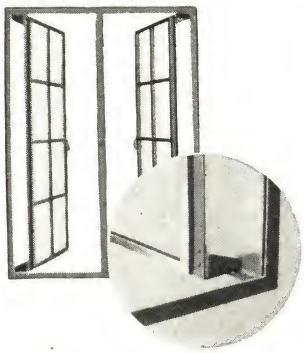
Specification—Windows where indicated on plans or hereinafter specified shall be provided with Soulé metal frame screens with 16-mesh copper-bronze wire cloth. Screen frame for projected out ventilators shall be built out to enclose the operating hardware and shall have recess and slot in sill to permit the operation of the ventilator through the bottom of the screen frame. Projected in ventilators shall have the screens attached outside with special clips and machine screws.



All screens shall be so attached to windows that they may be easily removed.



SOULÉ RESIDENCE CASEMENTS



Soulé Standardized Residence Casements are especially desirable for buildings in the class of modern homes and apartment houses. Holes are provided near the top for attaching bracket for shades and draperies. Provision can be made for receiving, inside, either stationary flat screens or roller screens. Standard residence casements can be furnished either with muntins, as shown below, or, for leaded glass, without muntins.

A solid bronze casement fastener, in any finish preferred, will be furnished, if specifically ordered, instead of the die-cast casement fastener. Heavy steel tee mullions are supplied when windows consist of more than one unit.

Friction Cleaning Hinge

This extension hinge, rigidly riveted to casement and electrically welded to window frame, holds casement firmly in whatever position it is set. Cleaning of window and adjustment of friction are easily done from inside building

Casement Fastener No. 130 Furnished as Standard

Die-cast in statuary bronze finish; shipped separate with screws for attaching after casements are installed. (Supplies in solid bronze, in any finish preferred, when specially ordered)

SOULÉ WEATHERSTRIPPED WINDOWS

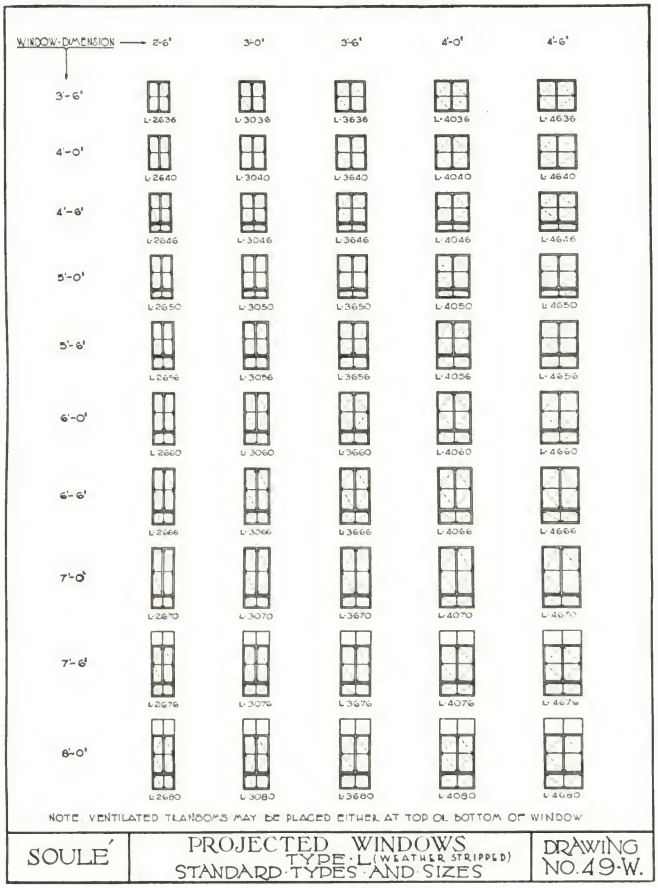
In this steel window with a weatherstrip built into the section and placed in the inside face of the window to preclude any danger of saturation, the SOULÉ STEEL COMPANY has patented one of the most successful devices for minimizing infiltration of air and dust that has been perfected in the development of steel windows for homes, commercial buildings, and monumental buildings.

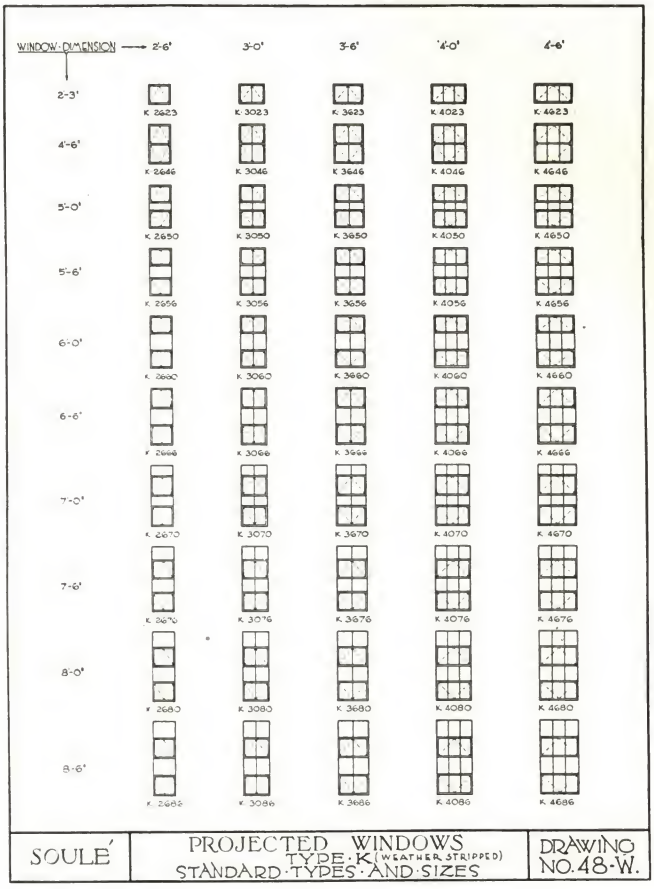
Type "L" Window Weatherstripped

The practical advantages of this recent improvement, which have been thoroughly demonstrated in the field as well as in university laboratory tests, have been widely appreciated by the architectural profession, for whose clientele they satisfy requirements that have long been urgent. These advantages are virtually self-evident in the nature of the construction, and we therefore believe that the Soulé Weatherstripped Window will have an immediate interest for architects who are planning buildings in which the expense of heating installation is an important factor, or fine homes in which it is judicious to use every practical means of overcoming the nuisance of dust and soot drifting in upon fine fabrics and furniture.

Practical Economy

While the convenience and greater efficiency of having the weatherstrip built into the section itself is instantly recognized, it is surprising to many builders to learn that the cost of Soulé Built-in Weatherstripping is less than one-fourth of the cost of applying weatherstripping after a window is installed. Yet any experienced builder can quickly verify this fact without resorting to pad and pencil. The Soulé Weatherstripped Window is therefore economical in first cost as well as a continuous economy in protection against the vagaries of the weather. Moreover, it is a beautiful window that is in harmony with the best modern design. As a collateral advantage of this construction, the weatherstrip forms a cushion upon which the window closes with velvety softness.





Type "K" Window Weatherstripped

Tested Efficiency

Recent tests made in university laboratories and subsequently checked with installations in the field show that the air infiltration through the Soulé Weatherstripped Window is one-fourth of that which normally occurs through other types of window. Reports from installations in monumental buildings indicate a material fuel saving and greatly enhanced protection from dust and moisture seepage.

We believe that the specification given on the following page covers all salient points of this notable improvement in steel window construction, but we should be pleased to have you call on our Engineering Department for any further data in which you may be interested. The advantageous position of the weatherstrip will undoubtedly enlist your attention.

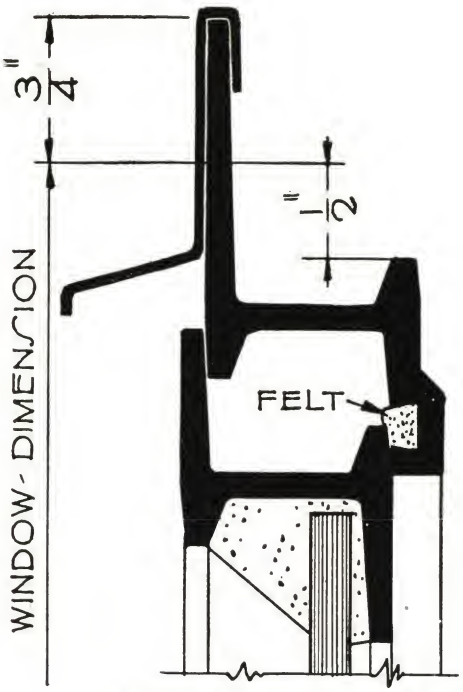
SPECIFICATION OF SOULÉ WEATHERSTRIPPED WINDOW

Where shown on plans, furnish and install Soulé Weatherstripped Windows. The frames shall be of specially rolled steel, so formed as to have a dovetail-shaped slot on the inside contact for holding the special weatherstrip. Wool felt shall be inserted into the slot with special tools for the purpose, and shall be held with a special moistureproof cement.

Corners of all frames and vents shall be electrically welded and all the exposed surfaces cleaned of excess metal. Vents shall operate on Soulé Sliding Shoe Fixtures with pivoting arms made of spring steel and attached to both the ventilators and frames with brass rivets. The bronze sliding shoe shall fit in a brass track of special patented construction which diverts the shoe toward the inside and causes vents to be in tight contact when closed. Project-out-at-side ventilators shall be equipped with bronze casement fastener No. 116 or No. 130.

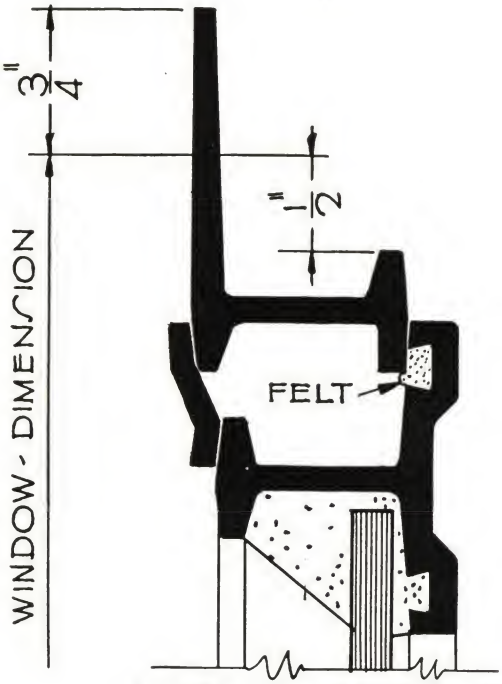
Project-out-at-bottom ventilators shall be equipped with casement fasteners No. 116 or No. 130 when within reach of floor, otherwise furnish No. 127 spring catch and transom eye No. 102.

Project-in top vents shall be equipped with No. 116 or No. 130 casement fasteners when within reach of floor, otherwise furnish No. 128 spring catch. All furnished hardware shall be solid bronze in light statuary finish.



When two or more units are used for one opening, supply mullions and bolts for connecting units.

Paint windows and mullions one priming coat of gray paint at the factory.



Windows shall be erected by manufacturer in openings prepared to the manufacturer's detail and shall be set plumb and true without distortion so that a weathertight installation is obtained.

Glass and glazing shall be supplied by another contractor, but the window manufacturer shall supply spring wire clips for holding glass in place. All windows shall be glazed from the outside.

HEAVY TYPE WINDOWS

In addition to the detail on the following page, we have prepared for architects and designers a catalogue providing information of valuable assistance in the design of heavy section window openings of virtually every kind for use in monumental, office, school, hospital, and residential buildings; and we should be pleased to send this comprehensive catalogue to you on request.

Although, to effect important economies, we have standardized in the construction of windows and their preparation for hardware, we realize that in the type of building for which heavy section windows are used individuality must be given freedom of expression; and accordingly our service does not limit the architect or designer to standard sizes and designs.

Our salesmen are trained to give you the information you require for preliminary study, and our designing department will collaborate with you by preparing sketches without committing you to any obligation.

The quality of our workmanship in heavy type windows is exemplified in several recent buildings of national interest.

All our finish hardware is made of solid bronze and may be furnished to match any other finishes ordinarily used.

Mechanical operators are furnished as standard, but only when specified. Other means of operating windows are also employed, depending on the type of ventilating unit.

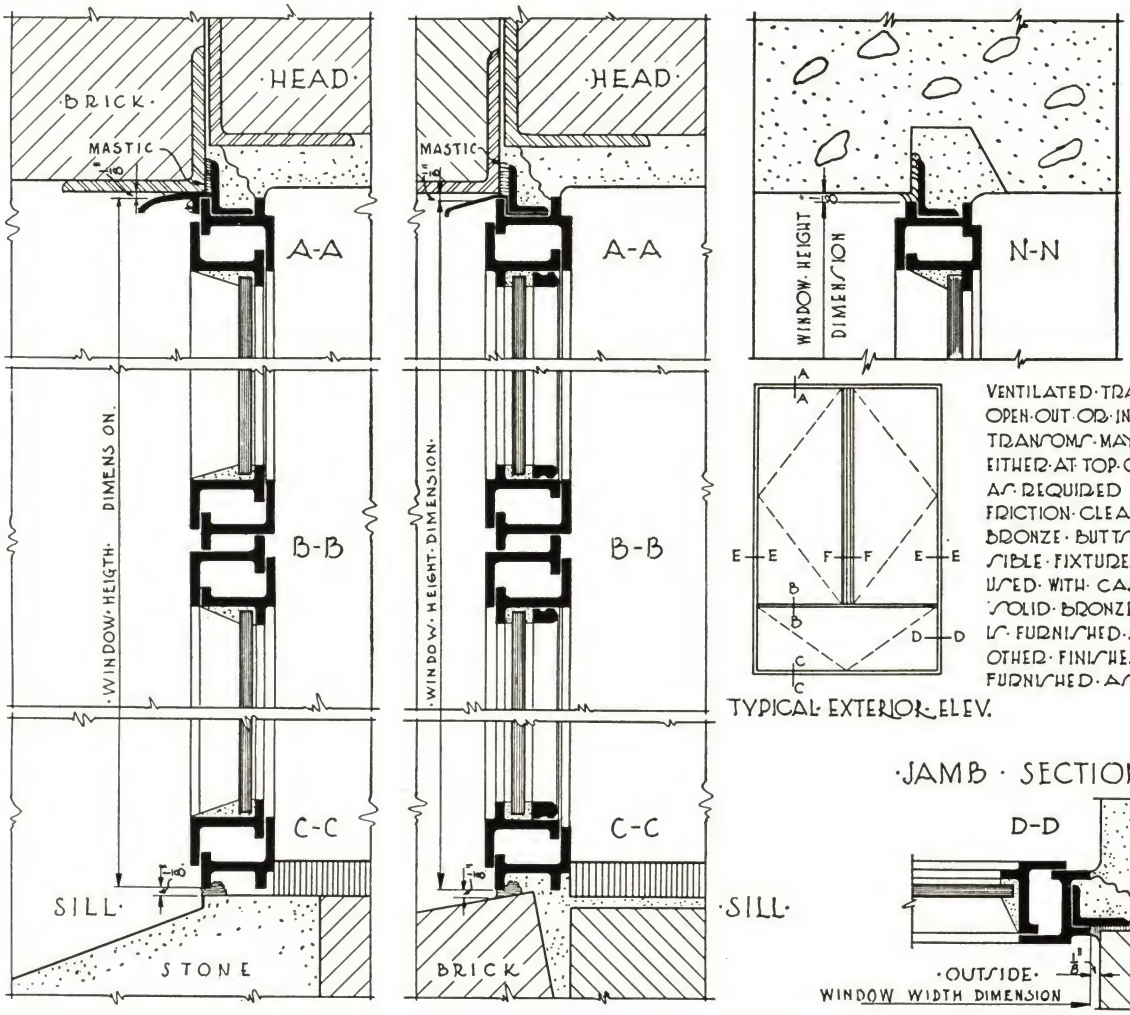
Maximum Sizes of Ventilators—

Projected casements, each leaf: width, 2 ft. 6 ins.; height, 6 ft.

Side hinged casements, each leaf: width, 2 ft. 9 ins.; height, 8 ft.

Project out or in ventilators: width, 5 ft.; height, 3 ft. 6 ins.

Specification

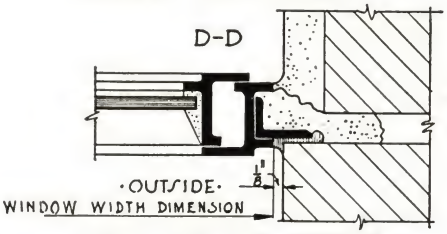


All windows shown on plans shall be Soulé Heavy Section Windows with ventilators to swing as indicated. All corners of frames and ventilators shall be electrically welded and ground smooth. Ventilators shall be carefully fitted into the frames to insure perfect weather tightness and easy operation.

Projected Casements and Ventilators—Where called for, projected casements and ventilators shall operate on SOULÉ sliding cleaning hinge, so that they may be cleaned from the inside. When vent is in a closed position no part of the hinge shall project either inside or outside of the plane of the window.

Hinged Casements and Ventilators—Where called for, casements and ventilators shall be mounted on extruded bronze hinge No. 124, with stainless steel pin. Supply solid bronze adjuster No. 161, one for each hinged casement leaf.

Glazing Beads—Moulded steel glazing beads shall be supplied for holding glass in place. Miters at corners shall be neatly and accurately fitted. (Miters of solid rolled beads may be butt welded at additional cost.)



Hardware—All casements not over 5 ft. high shall be furnished with single casement fasteners. Casements over 5 ft. high shall be furnished with two-point casement fasteners. All open in or out transoms out of reach of floor shall be supplied with transom catches.

J. S. THORN COMPANY

Manufacturers of Steel Windows, Steel Casements, Operating Devices, and Vertical Lift Doors

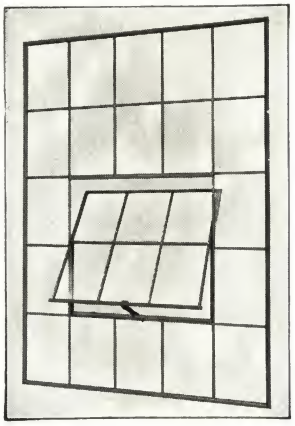
Allegheny Avenue and Twentieth Street, PHILADELPHIA, PA.

SALES REPRESENTATIVES IN PRINCIPAL CITIES

Member Solid Section Steel Window Industry

Products

PIVOTED WINDOWS, PROJECTED WINDOWS, CONTINUOUS WINDOWS; OPERATING DEVICES; BURVETT VERTICAL LIFT DOORS.



THORN CASEMENTS.

Also Skylights, Double Hung Windows, Steel Doors.

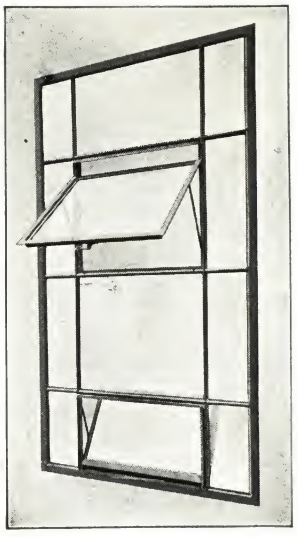
Pivoted Windows

Designed for use in all types of industrial buildings and constructed of solid steel sections 1⅜ in. deep. They are of substantial construction having all muntin joints welded. The Underwriters' label can be furnished when specified and as an extra. When labels are required no unit shall exceed 7x12 ft. and ventilators shall not exceed 4x5 ft.

Standard windows are furnished only in 12x18 and 14x20-in. glass sizes, except in the lights of vents where it is 1 in. less on each outside edge.

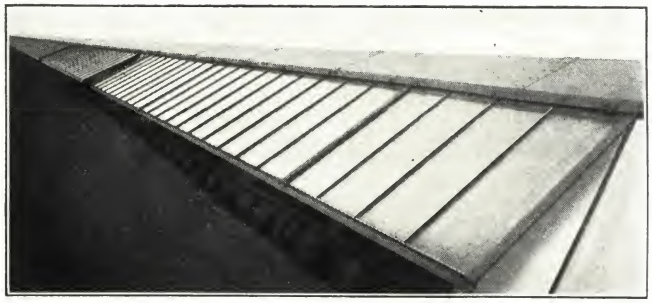
Thorn Pivoted Window

WINDOW OPENING DIMENSIONS



Lights	Width		Height	
	12″	14″	18″	20″
2	2′1⅝″	2′5⅝″	3′1⅝″	3′5⅝″
3	3′2″	3′8″	4′8″	5′2″
4	4′2⅜″	4′10⅜″	6′2⅜″	6′10⅜″
5	5′2¾″	6′0¾″	7′3¾″	8′6¾″
6	6′3⅛″	7′3⅛″	9′3⅛″	10′3⅛″
7	....	....	10′9½″	11′11½″

For multiple openings add window opening dimensions plus 2 ins. for each mullion to determine opening size.



Projected Windows

Economical office windows for industrial buildings, offices, schools, hospitals, etc., where screens and shades are necessary. Made of the same steel members and the same welded construction as Thorn pivoted windows.

They are made in commercial and architectural designs. The commercial type contains equal lights of 12x18 or 14x20-in. glass and is similar to pivoted window standards. The architectural type is made with combinations of large and small lights similar to typical window shown.

Thorn Projected Window

Thorn Continuous Windows

Continuous Windows

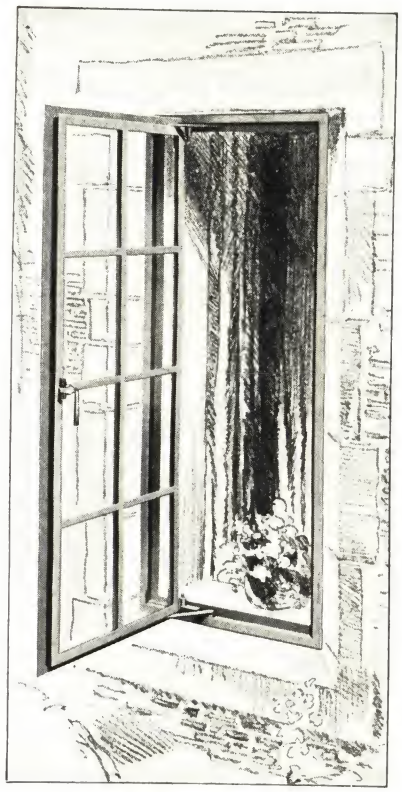
For use in roof construction. When properly incorporated in roof design they will perfectly daylight and ventilate buildings of great widths and lengths, increasing the efficiency of the workers and the quality of the product.

Controlled by long lines of the powerful Thorn tension operator they are particularly effective in quickly carrying off smoke, gases, etc. They form a great glass awning when open, the unbroken line of steel and glass permitting ventilation regardless of weather conditions. Stationary storm panels will be provided at the ends when ordered.

Tension Operator

Designed for long and heavy lines of windows and is a smooth working mechanism free from friction. Practically the entire load is carried by compound lever arms, eliminating strain on the tension line. Manual or motor operation.

Burvett Vertical Lift Doors



The improved Burvett Vertical Lift Door, manufactured by J. S. THORN COMPANY, is, we claim, the most modern development in steel door construction. It is built of a series of 16-gauge galvanized steel plate interlocking panels, which lift vertically, telescoping into a compact group to the height of a single panel and requiring a head clearance of about only 24 ins. when completely raised.

The great utility of door and ease with which plates can be removed and repaired make it desirable for warehouses, piers, freight stations, loading platforms, garages, factories, aeroplane hangars, etc., for it is built to stand hard usage.

Burvett Vertical Lift Doors

THORN CASEMENTS

Thorn Residence Casement

Residence Casements

Made of specially rolled solid steel casement sections and designed to produce a most rigid construction.

At all corners the sections are mitered, electrically butt-welded and ground to a smooth finish. Casements are equipped with iron handles and iron extension friction hinges unless otherwise specified.

They are economical, costing no more than a good quality wood casement and are more reasonable in price than double hung windows. They need not be weatherstripped because of their weathertight construction. They cannot warp, shrink, or swell.

Standard sizes are as follows:

Lights	Width	Height	Lights	Width	Height
1	11 7/16"	....	4	3' 3"	4' 1 5/8"
2	1' 8 9/16"	2' 11 1/2"	5	....	4' 11 5/16"
3	....	3' 13/16"	6	4' 10"	5' 10 3/4"

Add ¼ in. to above for clear opening.

Manor Casements

A standardized casement of the finest quality combining the very best of materials and workmanship.

Good, substantial, carefully designed $1\frac{5}{16}$-in. sections are employed, and although much heavier than Residence type the lines are neat and pleasing. As in all Thorn casement construction the corners are electrically butt welded, resulting in a strong solid unit.

The sections are especially designed for neat putty glazing with short bevels. Vertical and horizontal sight lines are maintained in ventilated and fixed sections. The famous patented Thorn friction hinge of forged steel and bronze is standard equipment, except if otherwise specified.

Standard sizes are as follows:

Number of lights, 2	Number of lights	2	3	4	5
Width, 1'7 7/8"	Height	2'1 5/16"	3'5/8"	3'11 15/16"	4'11 1/4"

The above are window dimensions—add ¼ in. to determine opening sizes.

Heavy Casements

Constructed of heavy 2-point specially rolled steel casement section with great care and accuracy. Glazing may be provided for by the use of putty only, or glass may be held in place with drawn steel glazing beads. Solid bronze hardware is used throughout.

Where desired, Thorn heavy type metal casements may be provided with a pressed metal subframe which is built in and the casements placed after openings are prepared.

They are custom built, can be made side hinged, projected or pivoted and permit great flexibility of architectural design.

TYPICAL INSTALLATION OF THORN CASEMENT IN STEEL SUB FRAME

Office Type Windows

Made of heavy casement sections and standardized in projected vent types for school and hospital construction, also in types having a combination of side hinged and projected vents for office and administration buildings.

They are fitted with friction hinges and solid bronze hardware.

The sizes are in multiples of 6 ins. the minimum width being 2 ft. and the maximum 5 ft. The minimum height is 3 ft. and the maximum 9 ft.

French Casement Doors

Made of heavy casement sections solidly welded at the corners, the lower section of the door arranged with a small kick panel. The threshold is of heavy extruded bronze riveted and brazed into the jamb members. They are fitted with beautiful bronze hardware including cremone bolts and friction adjusters at the head.

The standard type is made to fit an opening 3 ft. 7¾ in. x 6 ft. $10\frac{3}{16}$ in. and can be arranged to open in or out.

Screening

All standard casements can be fitted with special hardware to permit the operation of the leaves or vents without opening or removing the screens. Roll type screens may also be applied to all casements.

Literature

Catalogues and other literature fully describing any of the various types of Thorn Casements or other products will be mailed on request.

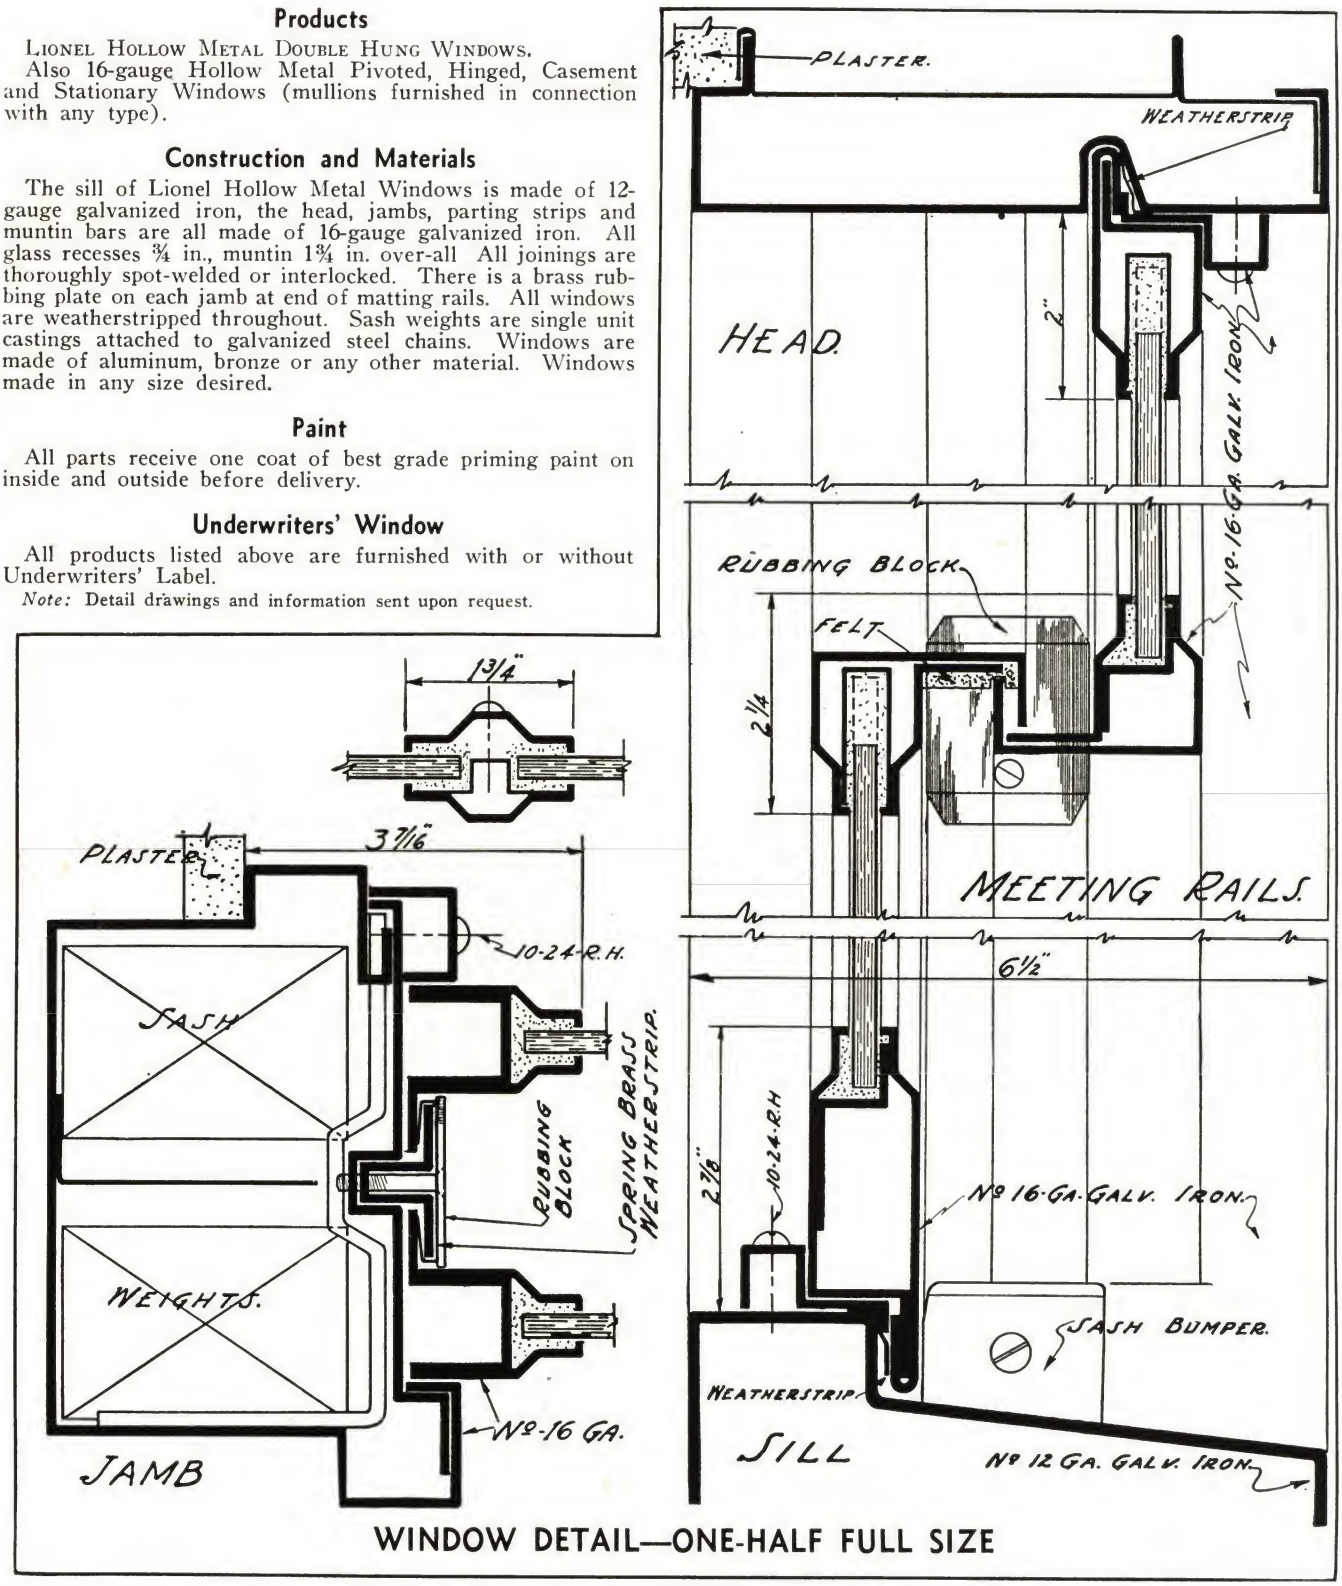
LIONEL HOLLOW METAL WINDOWS

Products

LIONEL HOLLOW METAL DOUBLE HUNG WINDOWS.
Also 16-gauge Hollow Metal Pivoted, Hinged, Casement and Stationary Windows (mullions furnished in connection with any type).

Construction and Materials

The sill of Lionel Hollow Metal Windows is made of 12-gauge galvanized iron, the head, jambs, parting strips and muntin bars are all made of 16-gauge galvanized iron. All glass recesses ¾ in., muntin 1¾ in. over-all All joinings are thoroughly spot-welded or interlocked. There is a brass rubbing plate on each jamb at end of matting rails. All windows are weatherstripped throughout. Sash weights are single unit castings attached to galvanized steel chains. Windows are made of aluminum, bronze or any other material. Windows made in any size desired.



Paint

All parts receive one coat of best grade priming paint on inside and outside before delivery.

Underwriters' Window

All products listed above are furnished with or without Underwriters' Label.

Note: Detail drawings and information sent upon request.

STEEL WINDOWS.

For other Truscon products see pages in this edition on Concrete Reinforcing Steel; Steeldeck Roofs; Standardized Buildings and Structural Steel; Steel Doors; Steel Joists; Metal Lath and Accessories; Channelplate and Teegrid floors; Safety-Tread Steel, as listed in Manufacturers' Index.

General

The complete line of Truscon Steel Windows includes types for every kind of building and purpose. Design, materials, construction, workmanship and equipment are the finest, assuring the ideal combination of highest quality products and types selected because of their especial fitness for particular installations. A further benefit accrues from the fact that all Truscon Windows are available in standard types and sizes, thus simplifying the architect's task of designing and permitting decided economies in manufacture. As a result, the purchaser obtains maximum values on the investment.

Window Service

Although the windows shown on the following pages are standardized in design, the wide range of types and sizes offers a broad latitude in architectural application. The objective of Truscon Window Service is to co-operate with architects to secure the most satisfactory window installation. Individual requirements, investment value, easy operation, simple installation, maintenance and permanence are important considerations.

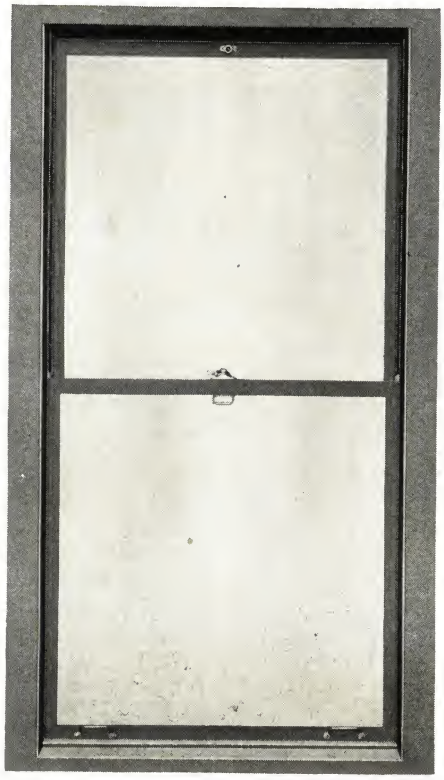
Because Truscon manufactures all types of windows, recommendations can be made without bias, based solely upon intimate knowledge and vast practical experience in window applications. Should conditions arise where special windows are required, Truscon engineers co-operate fully in the design and production of a type to fit the exact need.

Erection

To assist architects, contractors and owners in obtaining dependable results, Truscon mainains an organizaion of experts to undertake completely the erection and adjustment of steel windows. With this erection service, the TRUSCON STEEL COMPANY assumes entire responsibility for the window installation, including fabrication, delivery, erection and adjustment.

Literature

Steel window Handbook, A. I. A. filing size, 200 pages, contains details and drafting room standards for the complete line of windows. Separate catalogues on each type, A. I. A. filing size, sent free to architects.



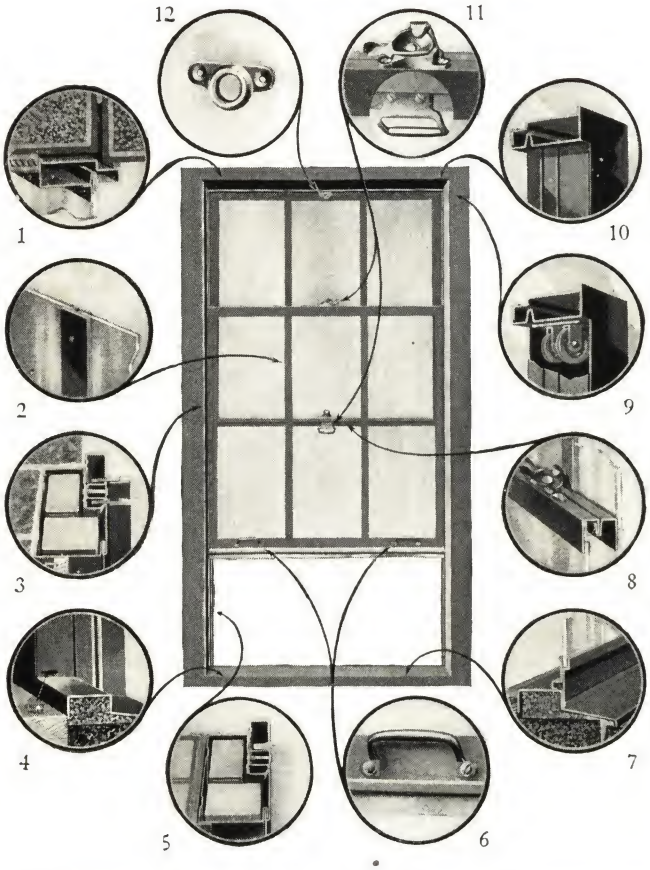
TRUSCON DOUBLE-HUNG STEEL WINDOWS

Counterweighted Model No. 28

Model No. 28 Truscon Double-Hung Steel Windows meet the modern demand for artistic design and quality workmanship. They are equally satisfactory in the practical advantages of easy operation and enduring, care-free service.

Their narrow, clean-cut members add to the attractiveness of any building and increase the daylighting of interiors. Their solid steel construction provides fire protection at the most vulnerable part of the building. The galvanizing of all parts prevents corrosion. The spring bronze weather stripping shuts out draughts and insures constant easy operation. Frames are made in one unit and are solidly welded at corners.

The details of construction, finish and hardware have been so perfected that Truscon Double-Hung Steel Windows are in harmony with the finest buildings, even though their cost under efficient Truscon manufacturing methods is so moderate that they are practical for general use.



Catalogue containing complete installation details furnished on request.

Counterbalanced Steel Windows

Similar in design to the Model 28 Double-Hung, combining beauty and high quality with ease of operation, unusual fire-resisting qualities and weathertightness. Made in a variety of models, Truscon Counterbalanced Steel Windows can be furnished simply with two counterbalanced sash, with two sash and projected type transom, with two sash and projected type bottom ventilator and with more than two sash. They may be arranged in bays or in a number of ways to meet building requirements.

TRUSCON DOUBLE-HUNG STEEL WINDOWS (Continued)
Counterweighted Model No. 28

Construction Details and Hardware

(1) Section Through Head of Frame—Showing one-piece channel construction with recess to receive upper sash rail; staff mould formed from two thicknesses of metal and head cover welded to frame section.

(2) Muntin Bars—When desired, can be furnished horizontally and vertically to secure small glass-light effects.

(3) Section Through Jamb—Illustrating the dual function of the jamb frame, as weight box and sash guide. Proper weathering is secured through spring bronze weatherstripping attached to the sash stiles.

(4) Concealed Grout Holes—Assure a firm and weather-tight bed for the window.

(5) T-Shaped Mullions—For joining two or more windows in a single opening. Held in place by means of concealed steel straps.

(6) Pair of Lifting Handles—Tap-screwed to the bottom rail of the lower sash.

(7) Section Through Bottom of Window—Showing double contact weathering between sash and sill.

(8) Section Through Meeting Rail—Showing interlocking contact between the upper and lower sash, and the spring bronze weatherstripping on upper rail of lower sash.

(9) Cutaway View of Jamb Frame—Showing the bronze-bushed, pressed steel chain pulleys that turn on hardened steel pins in heavy, pressed steel housings.

(10) Section Through Head of Window—Showing adaptability of head section to any type of construction and positive contact between sash and frame.

(11) Combination Sweep Lock and Pull-down Handle—The sweep lock is adjustable to secure proper contact and locking.

(12) Pole Socket—Attached to the top rail of the upper sash facilitates opening and closing this sash.

Note: Standard Hardware is sherardized malleable iron. Solid bronze can be supplied when bronze hardware is specified.

Condensed Specifications

(1) General—All window openings shown on drawings, unless otherwise specified, shall be equipped with solid steel, plate type (galvanized and weatherstripped) Model "28" Double-Hung Windows, as manufactured by the TRUSCON STEEL COMPANY, of Youngstown, Ohio.

(2) Material—All windows throughout shall be constructed of TRUSCON special hot-rolled new billet steel, galvanized. Sills shall be of 12-gauge; weight boxes, jambs, pulley stiles, heads and head covers 16-gauge; rails and stiles of sash 12-gauge; inside glazing strips at jambs 14-gauge, and at top and bottom rails 12-gauge.

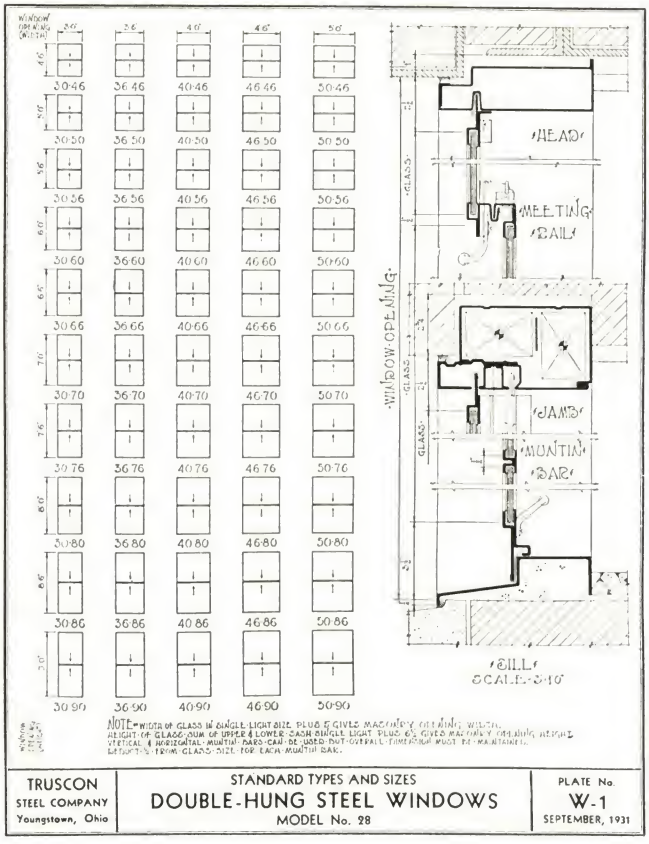
(3) Construction—Frame members: head, sill and jamb construction, each one piece of metal exclusive of parting stop, weight box cover and head cover; all members formed straight and true with welded joints ground smooth; staff bead formed on exterior of frame of double thickness of metal.

(4) Pulley Stiles shall be formed with deep weathering and the pulley stile and weight box cover held in place with one line of oval head screws passing through a heavy reinforcing piece on inside of jamb. Adjustment of sash and frame shall be secured by these screws which hold the pulley stile and weight box cover. The weight box cover shall run the full height of the jamb from sill to head, and shall be removable.

(5) A brass check plate shall be attached at meeting rails to insure proper weathering.

(6) A window stop shall be provided to prevent air entering room from slot under upper sash.

(7) Sash members shall be so designed that the distance from masonry opening to glass line at jambs and head will be $2\frac{1}{2}$ in.



(8) Corners of sash shall be welded and ground smooth.

(9) Where muntin bars are required they shall fit into the sash members and be so welded that a flush surface is secured at joints and intersections.

(10) The meeting rails shall be formed so as to interlock.

(11) Glazing strips secured with oval head screws permit inside glazing.

(12) Weatherstripping—Weatherstripping shall be provided of spring bronze and applied to sash members at sill, jambs, meeting rails and head. A spring bronze closure shall be applied to lower half of outer sashway.

TRUSCON DOUBLE-HUNG STEEL WINDOWS (Continued)
Including Aluminum and Bronze Windows

Segmental or Curved Head Units

Segmental or curved head units for double-hung windows can be provided in almost any radii or design. The inside of the window is finished either square or round at the head. The square head facilitates the use of shades and drapes and provides for the practical approach of the sash without interference with the exterior masonry treatment.

Double-Hung Window Units with Transoms

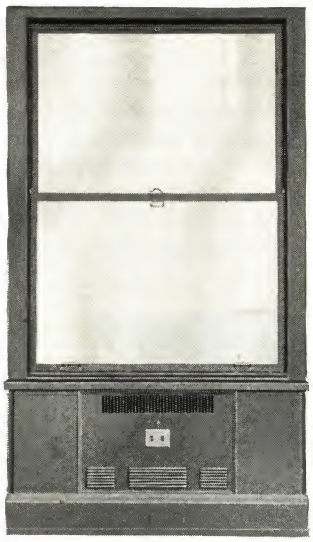
Transoms, when required, are incorporated in the main frame of the standard double-hung window. They are not a separate unit. This develops a window of great strength, compactness and neat appearance. All hardware is of standard design and finish. Muntin bars can be supplied in accord with individual specifications. Transom heights may be variable, depending upon requirements.

Aluminum and Bronze Double-Hung Windows

The increasing demand for ultra-fine windows for monumental buildings has been answered by Truscon with a line of beautiful windows in extruded aluminum and bronze, embracing every known refinement and being flawless in workmanship. These windows require no adjustment, for the extruded metal has a variation of only plus or minus .002 in., making it as accurate as a steel section machined by milling. Frame and sash sections are complete units, the jambs, heads and bottom rails being one-piece sections. A feature is the weathering at the sills where there is a double contact weathering between the sash and sill sections, plus an additional contact with the use of a weathering strip, which is entirely concealed in the bottom member of the lower sash.

For sheer architectural beauty, these windows have no equal. The sections are perfectly proportioned, having the weight of metal to assure architectural harmony. Air infiltration is reduced to the lowest possible minimum. Architects interested in these quality windows are invited to write for complete data.

Units with Weightless Mullions



Weightless mullions may be used in combinations of not more than two units. In this construction, by an ingenious arrangement of the sash chain and pulleys only one weight is used for each sash located in a box built in the masonry. This eliminates the weights in the mullion, reduces their width and effects a pleasing appearance.

The dimension of the mullion is reduced by 5 in.

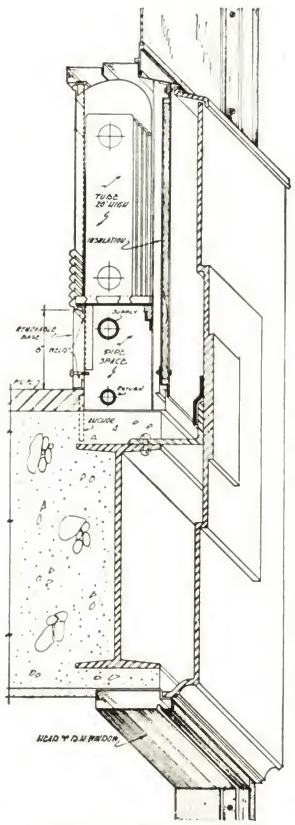
Unit with Weightless Mullions

Double-Hung Window and Heating Recess, Model No. 31-HR

Heating Unit with Motor Fan

In keeping with the modern conceptions of efficient building design, Truscon has developed a complete unit consisting of a high grade double-hung window and a heating recess, encased in a rigid steel frame.

Aside from economies due to efficient design and manufacture, these units simplify erection and permit the utilization of much expensive floor space which otherwise would be occupied by unsightly radiators which block off the most valuable part of the room, i. e., that part in front of the window.



The width and height are variable to suit the architectural treatment and story height. Spandrels of metal, stone Terra Cotta or other material are readily attached, extending from the sill of one unit to the head of the one below. The complete unit of window and heating recess may be placed and anchored in position immediately after the structural concrete is poured.

Recess for Any Standard Radiator

Widths and depths of the heating recess are variable to accommodate the standard makes of concealed radiators. The space under the window is insulated so that light, thin spandrels may be used.

Outlets from the heating recess may be through the window stool, through the front panel or through both. The front of the recess may be any of a number of materials and designs—plaster in its many forms, art metal, etc.

Left:
Typical Detail, Showing Metal Spandrel Applied

TRUSCON DOUBLE-HUNG STEEL WINDOWS (Continued)

Model No. 32

Foreword

The Model No. 32 Double-Hung Window has been developed to meet the demand of architects for steel windows having an architectural treatment along the lines of the conventional wood window, where weight is not as important as detailed appearance. However, the design of the sections of the Model 32 Windows is such that maximum strength is obtained, making the product exceptionally solid and substantial.

All parts are electro-galvanized and bronze weatherstripping at head, jambs, rail and sill assures weather-tightness, eliminates rattle and reduces air infiltration to a minimum. Frames are made in one unit and are solidly welded (not bolted) at all corners.

Salient Features

Galvanized Steel—All parts are electro-galvanized to give added protection against corrosion. Before shipment, the window is given a dip coat of special protective paint.

Welded Frames—Frames are made in one unit and solidly welded (not bolted) at all corners, insuring weather-tightness, solidity, rigidity and perfect alignment. They will not get out of square.

Specially Designed Sash Rails and Stiles—Built of specially designed, cold-rolled sections. All surfaces, inside and out, offer no objectionable features in appearance; cleaning and painting are accomplished easily.

Muntin Bars—Specially designed sections, constructed to give proper bearing for the glass. They are interlocked and welded at all intersections.

Deep, Rigid Sills—One-piece sill of depth and stiffness to prevent bowing, bending or leakage. All flat surfaces, with no pockets or grooves.

Weatherstripping—Spring bronze weatherstrips are attached to sash at head, meeting rails, jambs and sill. This insures positive weather-tightness, eliminates rattle and reduces air infiltration to a minimum.

High Quality Hardware—All hardware is bolted, tapscrewed or welded, insuring rigidity and strength. Chain pulleys are pressed steel with bronze bushings and turn on hardened steel pins in heavy pressed steel housings. Sash chains are easily accessible.

Deep Weight Wells—Wells are deep, straight and true. The jamb will not warp or get out of line; its perfect alignment reduces friction to a minimum in opening and closing the window.

Condensed Specifications

(1) General—All window openings shown on the drawings, unless otherwise specified, shall be equipped with solid steel, plate type (galvanized and weatherstripped), Model No. 32 Double-Hung Windows, as manufactured by the TRUSCON STEEL COMPANY of Youngstown, Ohio.

(2) Material—All windows throughout shall be constructed of Truscon Special hot-rolled, new billet steel, galvanized. Sills shall be of No. 14 gauge; weight boxes, combination jamb, cover plate and parting strip 18 gauge; rails and stiles of sash 18 gauge; inside glazing strips at jambs 14 gauge; head cover plate 24 gauge; head 16 gauge.

(3) Construction—Frame Members: head, sill and combination jamb, cover plate and parting strip constructed each of one piece of metal, exclusive of weight box cover and head cover; all members formed straight and true with welded joints ground smooth; staff mould formed as separate piece.

(4) Combination jamb, cover plate and parting strip (removable) formed with deep weathering. Weight box cover held to jamb member. Weight box cover shall run the full height of the jamb from sill to head.

(5) A brass check plate shall be attached at meeting rails to insure proper weathering.

(6) Sash Members: Sash members shall be so designed that the distance from masonry opening to glass lines at head will be 2½ in.; at jambs 1⅞ in.

(7) Corners of sash shall be welded and ground smooth.

(8) Where muntin bars are required, they shall fit into sash members and be so welded that a flush surface is secured at intersections.

(9) The meeting rails shall be formed so as to interlock.

(10) Glazing strips shall be secured with oval-head screws to permit inside glazing.

(11) Weatherstripping—Weatherstripping shall be provided of spring bronze and applied to sash members at sill, jambs, meeting rails and head.

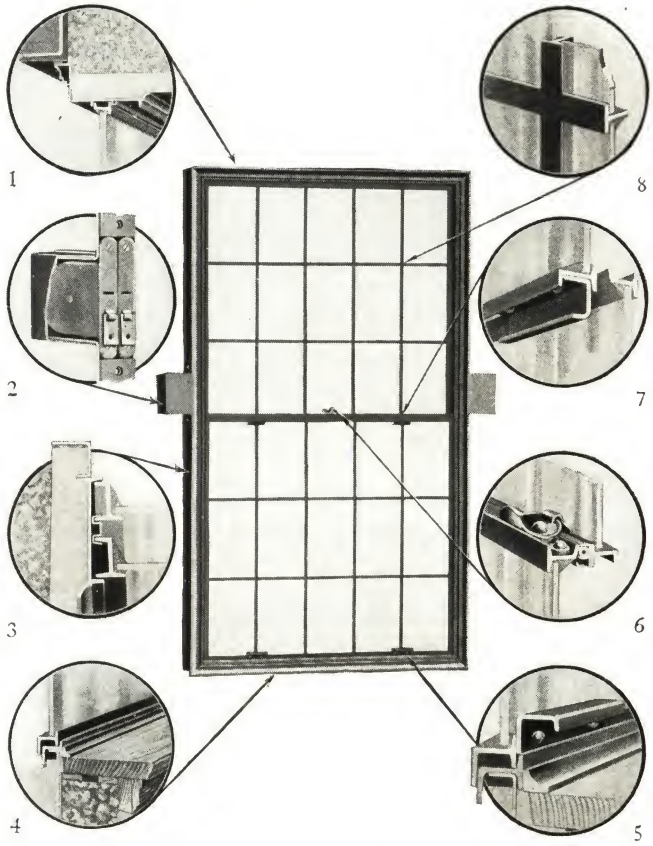
(12) Hardware Equipment—Frames shall be equipped with pressed steel pulleys and pressed steel housings, with hard steel pins in a brass bushing. Sash shall be hung on No. 130 Galvanized Steel Sash Chains, exposed and properly balanced with cast iron weights.

(13) Sash shall be equipped with one pair of lift handles, one sweep lock, and one pole socket; all of galvanized malleable iron.

Note: Special steel or lead weights shall be supplied where cast iron weights are not sufficient to balance sash properly.

Note: Hardware is furnished in bronze, where so specified, at an additional cost.

(14) Painting—All windows shall be given a dip coat of Truscon Special Protective paint after assembly (in addition to galvanizing) and before shipment, covering all surfaces, inside and outside, weight boxes and other concealed spaces.



TRUSCON DOUBLE-HUNG STEEL WINDOWS (Continued)

Light Weight Spring Balanced

Foreword

This window has achieved great popularity for governmental work, especially in the many new Veterans' Hospitals. The narrow, trim lines and very economical price of the Light Weight Spring Balanced Window make it a practical installation for residential and similar light-duty construction.

Although termed a "light-weight" window, the many features of the Truscon design impart a sturdiness and rigidness usually associated with much higher priced types. Frames are made in one unit and solidly welded at corners. Specially designed sash sections are mortised and tenoned and air-hammer riveted. A special feature is the frame section, 3¾ in.

over all, which includes an integral moulding that imparts an exceptionally well finished appearance to the window on the inside, adds rigidity to the frame and simplifies erection.

Weathering is provided by means of a specially designed combination weathering and parting strip of bronze at the jambs; a special rubber tubing encased in a metal housing at the meeting rail intersection; and double contact weathering at head and sill.

The window may be used either with single pane glass or divided into smaller glass sections by means of muntin bars which have mitered and mechanically interlocked joints that develop maximum strength and offer a neat, flush surface on the inside.

Construction Details

(1) Head Section—Cross section of outside frame showing inner moulded edge and sub-frame of 14-gauge metal, together with exterior moulding of 18-gauge metal.

(2) Spring Balances—Enclosed in metal housing securely attached to frame. Metal tapes attached to sash.

(3) Jamb Weathering—Specially designed of bronze, forming a parting strip and weatherstrip in the same piece.

(4) Sill Section—Showing double contact weathering.

(5) Lift Handles.

(6) Meeting Rail—Showing special sections, weathering block and special rubber tubing.

(7) Pull Down Handles—Attached to upper sash.

(8) Muntin Bar Intersection—Made with a mechanically interlocked joint having great strength and offering a neat, flush surface on the inside. Vertical and horizontal muntins are of the same size, affording a uniform putty face and permitting a satisfactory glazed installation.

Condensed Specifications

(1) General—All windows shown on drawings, or called for in Specifications, shall be Light Type Spring Balanced Double-Hung Windows, as manufactured by the Truscon Steel Company of Youngstown, Ohio. No substitution shall be permitted without the written approval of the architect or engineer.

(2) Material—Frames and Sash: Shall be constructed of hot-rolled new billet steel; sub-frames shall be of 14-gauge material; exterior moulding of 18 gauge.

(3) Construction—*(a) Frame Members*—Head and jamb members shall be of a special rolled section, depth of section to be not less than 3¾ in. including cove moulding, which is an integral part of the frame section.

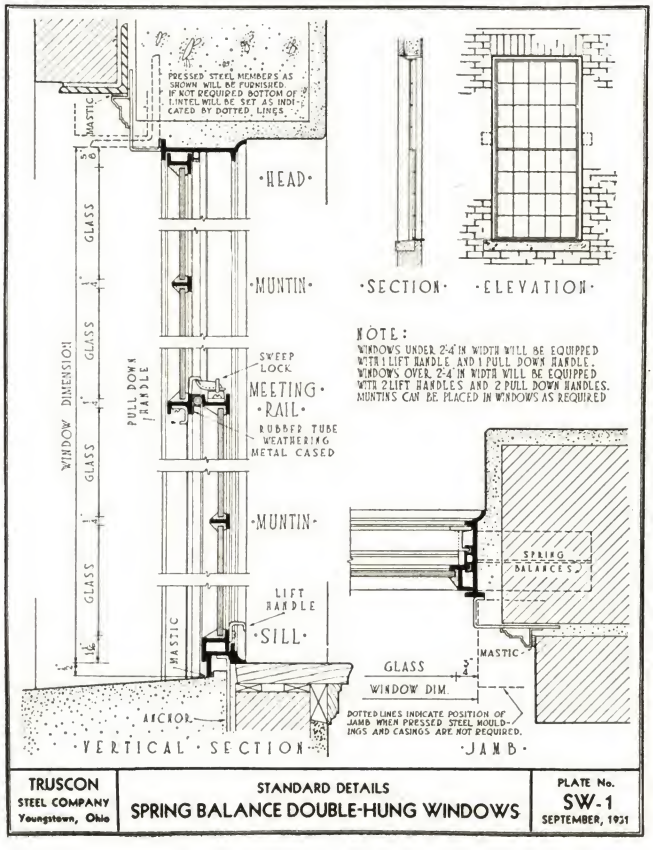
Intersection of sections to be welded and ground smooth where necessary. When required, an exterior sub-frame and moulding may be applied to frame section (see detail).

(b) Sash—Shall be constructed of channel sections not less than 1 7/16 in. deep, the corners to be mortised and tenoned and air-hammer riveted.

(c) Muntins—Where required, shall be hot-rolled "Tee" sections. At intersections, there shall be a mechanical joint rigidly interlocking the muntins flush with each other. Joints of muntins and frames, stiles and rails shall be tenoned, mortised and air-hammer riveted.

(4) Weathering—A specially designed combination weathering and parting strip of bronze shall be provided at the jambs. (See detail.) There shall be a weathering block provided at the meeting rail. Meeting rail intersection shall have a special rubber tubing encased in a metal housing to provide weathering.

(5) Hardware—*(a)* All units shall be equipped with one pair of steel lift handles, one pair of pull down steel handles and one malleable iron sweep lock with steel strike.



Note: All windows under 2 ft. 4 in. in width will be equipped with one lift handle and one pull-down handle.

(b) Each sash shall be suspended on two enclosed spring balances as furnished by Truscon Steel Company.

Spring balances shall be enclosed in a metal housing and securely attached to frame. Metal tapes shall be properly attached to sash and shall hang vertically and run freely at all times.

(6) Anchors—Units shall be equipped with strap anchors at jamb for attaching to building construction.

(7) Painting—All windows shall be given one coat of protective paint, before shipment.

TRUSCON DONOVAN AWNING TYPE STEEL WINDOWS

Model No. 29

Description

Daylight illumination without sun glare, and natural ventilation without draughts are provided for schools, hospitals, offices, hotels, apartments and public buildings by Truscon Donovan Awning Type Steel Windows. They are made of high quality steel and are superior in design, construction, workmanship and operation. Their moderate cost makes them practical for any building.

Simple, substantial and pleasing in appearance, the Donovan Window details have been carefully worked out to make possible the practical application of the latest and best principles of perfect ventilation and correct lighting.

Two or three superposed sash, supported in each sturdy frame, open outward in unison to provide all the benefits and weather protection of an awning, and accomplish the proper deflection of air currents upward and toward the far side of the room. Movement of the lower sash operates the upper, but by merely moving a lever, the lower sash may be opened or closed independently of those above.

An essential feature is the method of attaching shades, one to the lower rail of each sash, which makes it an easy matter, when the sashes are open, to shut out the direct rays of the sun without interfering with the daylight illumination or in any way obstructing ventilation.

The Donovan Window is easily cleaned from the inside with safety and economy, and costs no more than old-fashioned types. Its perfected form is the outcome of long experience, often making possible a saving of from ten to fifteen percent in building costs by removing the necessity of expensive plenum systems.

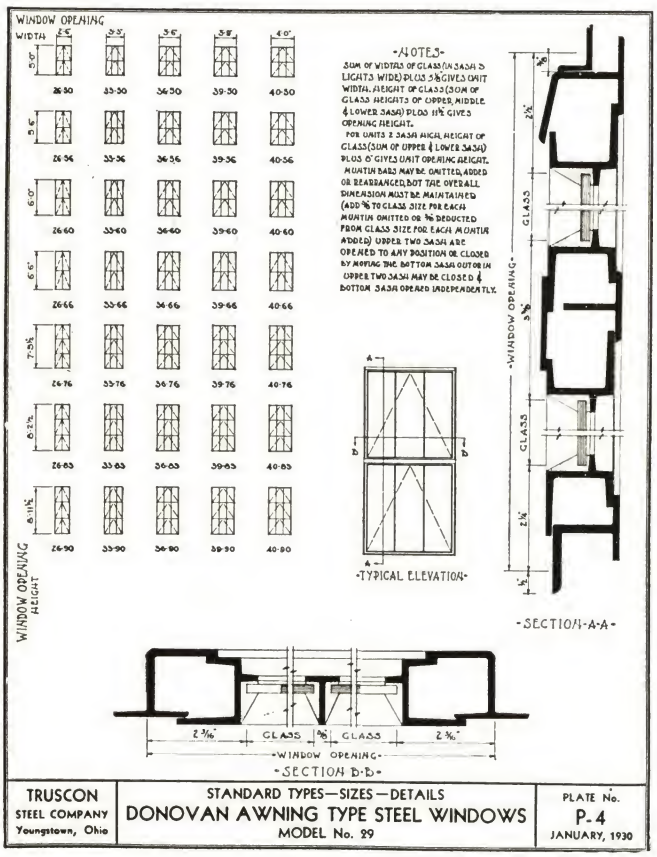
The Donovan Window Catalog is available on request.

Construction Details

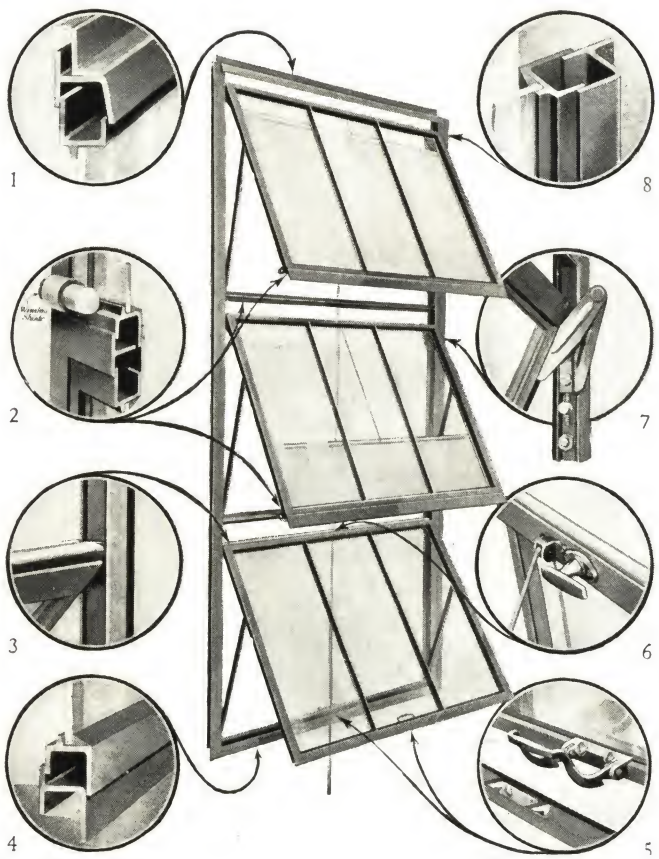
(1) The Head Construction—Utilizes a heavy Tee section as a bearing against which the top ventilator makes a two-point contact that is positive and weathertight. An angle welded to the Tee bar provides an anchorage fin that insures a tight installation in the wall.

(2) The Meeting Rails—Are Tee sections which provide a two-point flat contact bearing for the bottom rails of the ventilators to which drip strips are welded for further weatherproofness. Note that the shade bracket is placed close to the ventilator to prevent infiltration of light.

(3) The Bottom Ventilator Pivots—Are ruggedly constructed. When the bottom ventilator is released from the others, the pivot pins are pulled and the bottom ventilator guided by shoes, as shown. Spring pressure snaps the pins back into position for regular operation.

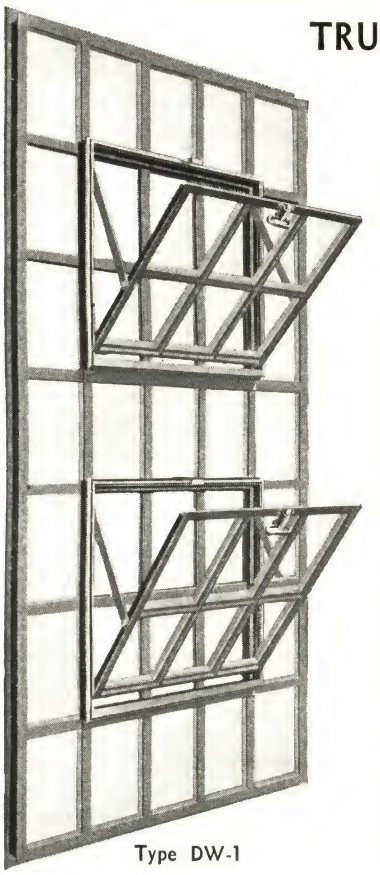


(4) The Sill—Also utilizes two-point flat contact construction to assure weather-tightness, and in addition, the longest leg of the sill member is placed on the outside to make weathertight contact with the masonry.



(5) The Locking Handle and Strike—Permit the window to be locked by a simple down and inward pull, practically automatic. The handle is shaped and placed so that the knuckles of the operator cannot be scraped on the sill. This handle provides complete operation of all superposed sash.

(6) The Releasing Handle—Disconnects the bottom ventilator from the others so that each ventilator may be moved separately and left in any desired position without reference to the positions of the others.

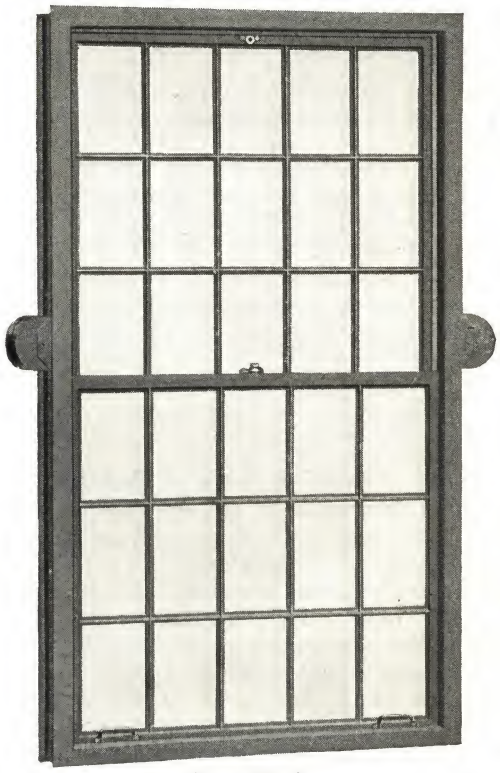


(7) The Upper Ventilator Hinges—Are fastened to the connecting bars by screws and to the ventilators by welds. The tightness of the ventilators can be increased or relieved by moving these hinges up or down on the bars. The adjustment is easily made with a screwdriver.

(8) The Jambs—Also utilize the two-point flat contact weathering system, the same Tee section being used here as at the head and sill, providing exceptionally fine contact with the walls or mullions.

TRUSCON DETENTION STEEL WINDOWS

Type DW-1



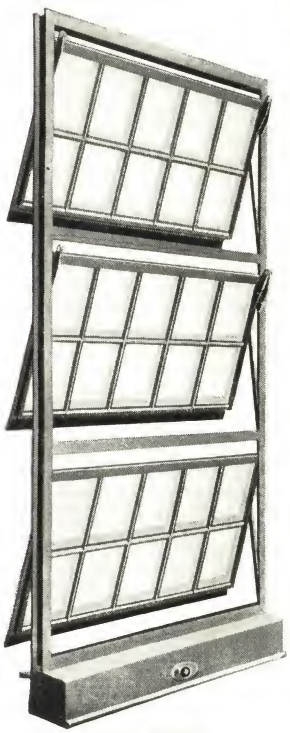
Description

In selecting windows for detention institutions such as prisons, reformatories and psychopathic hospitals, the designer requires a variety of types to conform to the different conditions found within the institution.

A window that provides adequate security for one class of inmates may be totally inadequate for a more desperate class. It was with the object of providing maximum efficiencies consistent with the degree of detention-security desired that the various types of Truscon Detention Windows were developed.

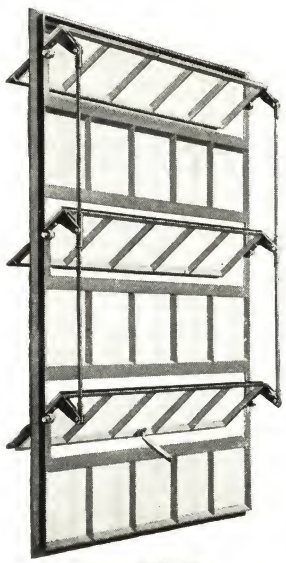
Included in the full line of Truscon Detention Windows are types which will meet all requirements for such institutions. Each type offers particular advantages—in some cases, maximum security; in others, such as those suitable for hospitals and minor psychopathic wards, maximum lighting and ventilation.

These windows are quality products throughout, constructed with great care, of high grade materials and smoothly finished. All screws are riveted so as to be non-detachable and all bars, adjusters and other parts are irremovable.



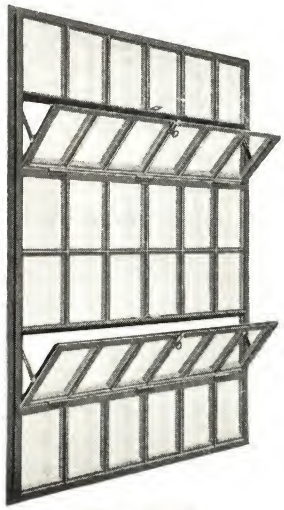
Type DW-2

Lockbar Type DW-1

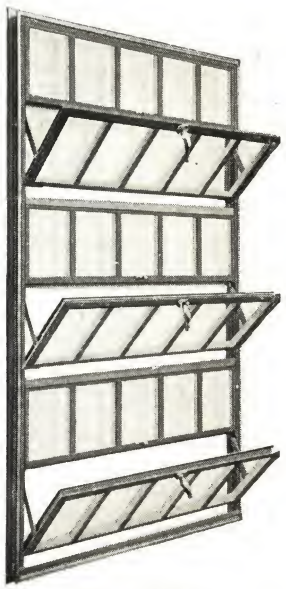


This type provides the maximum detention qualities available in modern steel window construction. Vertical muntin bars weigh 2.10 lb. per linear ft. and horizontal bars weigh 1.98 lb. per linear ft. The design offers maximum resistance to sawing. Ventilators are of the projected type, opening up and in. Bronze friction shoes and bushings insure against corrosion and wear. Screens may be installed between the vents and the continuous outside bars.

Spring Balanced Type DW-2



Where the exterior and interior simplicity of ordinary institutional construction is the desirable feature, these windows are excellent. A pressed steel frame provides an architectural effect both inside and out. Each sash is balanced on two spring balances, designed so that the tension can be adjusted easily, with neither the balance nor the tape exposed. Extent of opening is governed by a stop, removable only by a special key; jamb locks also may be provided. Two point weathering at head and sill and spring bronze weatherstripping at jambs afford effective weathering. Hardware may be either malleable iron or bronze. Ventilation may be obtained at both top and bottom.



Type DW-6

Type DW-10

Type DW-9

Type DW-7

TRUSCON DETENTION WINDOWS (Continued)

Spring Balanced Type DW-3 and DW-3A

These windows provide the same ventilation, light and detention advantages as Type DW-2, but are different in construction. The frame of the DW-3 window is constructed of hot-rolled steel. Stiles, rails and muntins also are hot-rolled new billet steel. The DW-3A window is generally similar in design except that heavy rolled steel sections, welded at all intersections, are used where strength and rigidity demand. Mouldings and casings are formed steel, and the sill is designed for use with auxiliary stone and concrete.

Weathering is provided by two-point contact and bronze weatherstripping. Each sash is balanced on two spring balances, adjustable without removing from jamb. Extent of opening governed by stop removable only by a special key. Jamb locks may be supplied. There are no detachable parts, for all hardware is screwed to the sash and riveted. Hardware is of good design and may be either malleable iron or water-rolled bronze.

Spring Balanced Type DW-4

This type of window provides excellent detention qualities and may be used in corridors of cell blocks and other buildings where supervision is possible. It has a fixed frame section on the outside with bars continuous from jamb to jamb and head to sill. The fixed frame and bars are backed up with a sliding sash at the lower half of the window. The sliding sash and the portion of the fixed frame above the sash are glazed, whereas that part directly in front of the sash remains unglazed. This gives the desired ventilation and retains detention qualities.

The sliding ventilator is equipped with two spring balances that are enclosed in a pressed steel box, concealed in the masonry when installed, and adjustable for tension without removing from jamb. Weathering is provided by two-point contact at sill, interlocking meeting rail and spring bronze weatherstripping at jambs. Jamb locks may be provided and all hardware is riveted in place to be irremovable.

Donovan Awning Type DW-5

This type provides maximum light and 100% ventilation and is particularly advantageous because all ventilators may be operated by hand as a unit from the floor. The stop at the jambs, removable by authorities with a special key, prevents the opening of the window greater than a predetermined maximum at any point. The stop may be removed to permit the easy washing from the inside of the building. The window is constructed of heavy sections, has no removable parts to be used as possible weapons and no pole is needed for operating. This window is desirable for psychopathic wards and curative institutions, but when maximum detention qualities are wanted, this security can be obtained by means of permanent bars in the masonry. It is a standard type of window adaptable to institutions where minimum labor for correct ventilation is desirable. Screens are easily applied to the inside and proper weathering is obtained through two-point contact throughout.

Donovan Awning Type DW-6

The Donovan Awning Type Window DW-6, has all the features and details of the hand-operated Donovan Window DW-5, but is mechanically operated by a removable crank which is in the possession of the authorities. This permits the desired ventilation but prevents inmates from adjusting the ventilation contrary to the desires of those in charge.

This window is particularly advantageous for use in tuberculosis and similar institutions.

The crank operation may be extended to provide mechanical operation from remote control and thus be used for forced ventilation in cells for solitary confinement. In such cases there should be a wire screen, of $\frac{3}{16}$-in. wire and not more than $\frac{3}{8}$-in. opening, between the prisoner and window.

Projected Prison Type DW-7

For detention purposes the glass area is limited to 6x9 in., with muntin bars sufficiently heavy to prevent rapid escape by the use of contraband tools. Due to the limited height of the glass, the ventilator cannot open to a sufficient degree to permit escape and ventilators cannot be removed from frame.

The DW-7 Window is built from heavy casement sections, but of a design that is economical to fabricate, with the vents projecting up and in. Individual screens may be applied to each ventilator or one large screen may be used for the entire window. It is possible to wash the outside of the window from the inside if the ventilators are properly placed.

Effective weathering, due to $\frac{3}{8}$-in. flat double contacts throughout, is provided. The vents are held in any desired position by two supporting arms and bronze friction shoes. Hardware may be either malleable iron or solid cast bronze.

Hinged Type DW-8

This type provides excellent detention qualities and is suitable for use in outside cells even where supervision is not possible except from a corridor. The amount of ventilation depends upon the size of the openings and the number of lights in units.

The bars in the fixed portion are continuous from jamb to jamb and head to sill. Vertical bars are spaced 6 in. on centers, and horizontal bars 9 in. on centers. These bars are backed up with bottom-hinged ventilators which are glazed, the portion of the fixed frame directly in front of the ventilators remaining unglazed. Ventilators may have small lights or one pane of glass.

All sections are constructed of Truscon specification, hot-rolled steel, giving maximum resistance to shock and great resistance to bending. There are no detachable parts, as the hardware and supporting arms are riveted to the window. This window may also be supplied with ventilators to project up and in. Screening is accomplished by fastening the screens directly to the outside fixed portion which remains unglazed.

Bottom-Hinged Type DW-9

The detention characteristics of this window are the same as the interior projected window, and it is preferred by many architects and engineers over the latter. For detention purposes the glass area is limited to 6x9-in. lights, preventing sudden escape by the mere breaking of the glass; although the muntin bars are not of the heaviest type, they prevent sudden escape by the use of contraband tools.

Ventilators, which are limited in number to every alternate glass height, are hinged at the bottom with heavy steel butt hinges; one leaf being welded to the vent and the other riveted to the frame. Steel pins of the hinges are welded to one leaf of the hinge. The vents can be opened six in. at the head and are held in position with supporting arms that are concealed within the sections when closed.

Weathering is very effective, having two-point contact at all points. Screens are applied to the outside.

Horizontally Pivoted Type DW-10

This is another of the various types of Truscon Windows available for use in detention institutions. The horizontally pivoted window is limited to 6x9-in. lights for detention use, preventing sudden escape by mere breaking of the glass. The vents are operated simultaneously in one unit by connecting bars operated by the bottom vent. The window allows 50 per cent ventilation, for it is possible to have ventilation at each alternate glass height.

These windows, as variously designed by architects, are suitable for workshops or exterior wall windows in interior cell block construction, preferably in institutions with surrounding walls, and may be varied to suit requirements.

TRUSCON RESIDENCE CASEMENTS

Series 5

Foreword

The increasing preference for Truscon Residence Casements is due largely to the inherent beauty, architectural harmony, simplicity, fine quality and superior craftsmanship which go to make these modern windows. Constant effort toward their improvement has resulted in many changes; the sections are of better design, the hardware is artistic and beautifully finished, weathering is positive and screening has been developed so that the complete casement presents an ultimate degree of refinement.

Single and combination casements in a large range of sizes, with or without sill ventilators or transoms, and with several fine screen solutions available, permit the selection of the exact type to meet individual requirements.

Casement Doors

Truscon Steel Casement Doors make a practical installation in conjunction with the Residence Casement. Handsome in appearance, mechanically and architecturally correct, they are adaptable to many styles of buildings, including homes, city and country clubs and apartments with private porches.

These doors are made in one standard size, each leaf 2-lights wide and 6-lights high, with a steel panel at the bottom. They conform perfectly to the Residence Casement, having the same sections. etc.

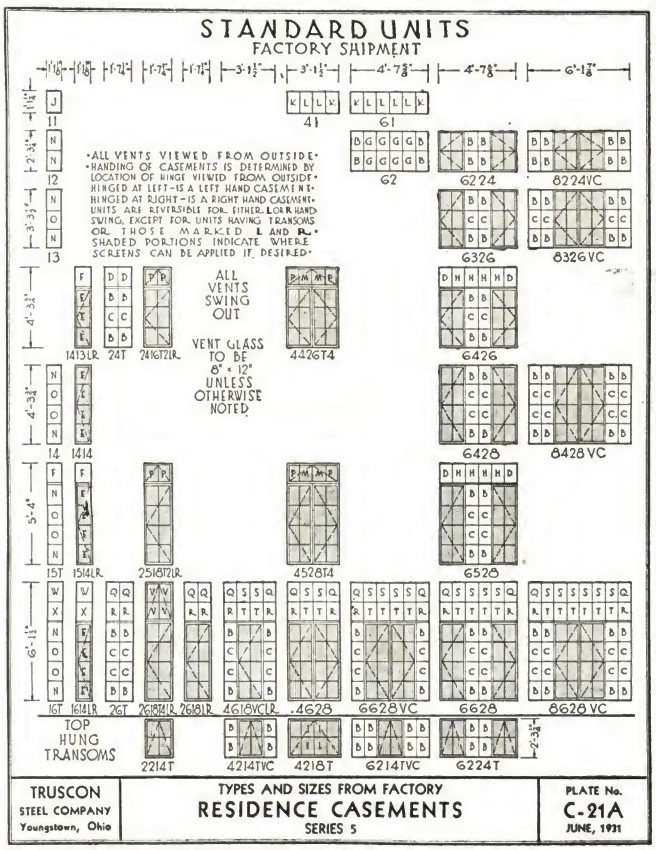
Condensed Specifications, Truscon Residence Casements, Series 5

(1) General—All Window openings shown on drawings unless otherwise specified shall be fitted with a standard type of casement as manufactured by the TRUSCON STEEL COMPANY of Youngstown, Ohio.

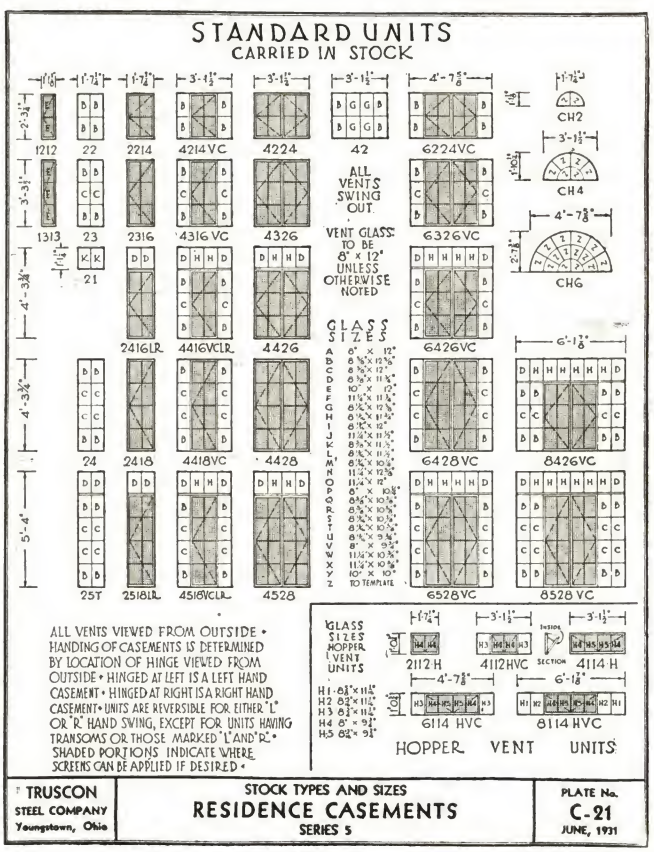
(2) Construction—*(A)*—All casements and standard combinations shall be manufactured in complete units at factory. The nominal glass size shall be 8x12 in.

(B)—All frames and stiles and rail members of swing leaves shall be Zee bars. All corners to be mitered and electrically butt welded. Exposed faces at welds to be ground smooth.

(C)—All muntins shall be Tee bars with a ⅝-in. face and a depth of ⅞ in., and shall be continuous between rails and stiles. At intersections there shall be a mechanical joint rigidly interlocking the muntins flush with face on the inside. Joints of muntins with frames, stiles and rails shall be tenoned, mortised and air-hammer riveted. Horizontal muntins shall be punched for glazing clips.



(D)—All side hung swing leaves shall open outwardly and be equipped with heavy extension (cleaning) hinges that are securely riveted to rails of sash and electrically welded or riveted to frames.

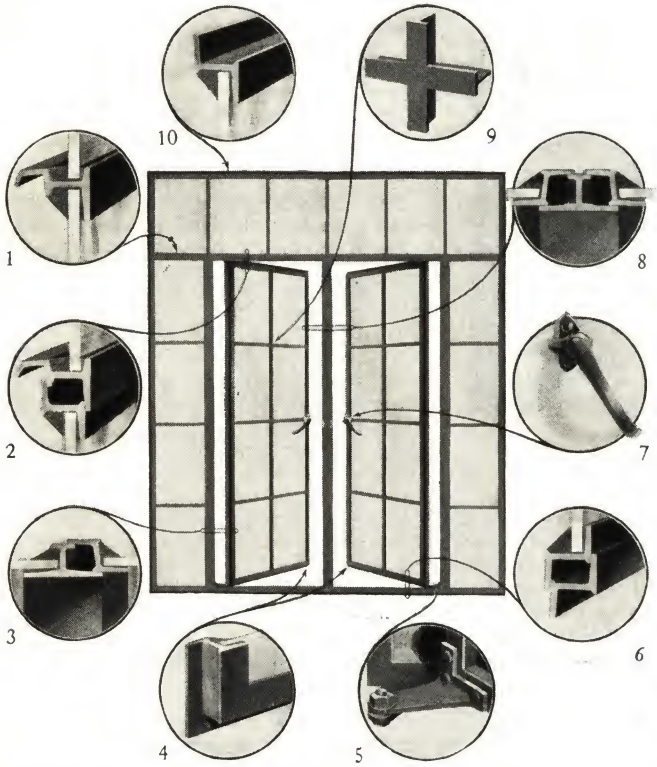


(E)—Hinges shall be of the special Truscon friction type, designed to hold window open in any desired position.

(F)—Windows shall be hinged to swing right or left as indicated. Continuous double contact weathering between swing leaves and frame shall be provided.

(G)—Where combinations of standard units are required for any single opening, vertical and horizontal mullions shall be used to join them.

(H)—A continuous drip strip shall be provided on transom bars of all standard swing leaf combinations.



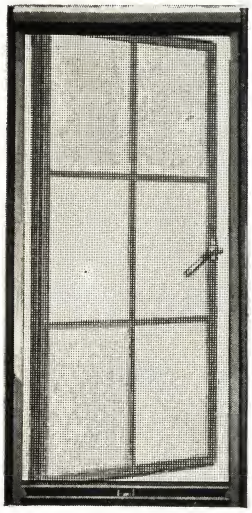
TRUSCON RESIDENCE CASEMENTS (Continued)

Construction Details of Residence Casements

(1) Transom Bar Section—Showing shape and position when used in unit.

(2) Ventilator Head Section and Transom Bar—Drip is an integral part, affording protection to ventilator below. Continuous from jamb to jamb.

(3) Interior Supporting Member for Ventilator—Heavy Tee section forming jamb for ventilator, with double contact weathering and insulating air space.



(4) Corners of Frame and Ventilators—Mitered, electrically butt welded and ground smooth.

(5) Friction Type Extension Hinge—Has the proper amount of friction to hold ventilator in any desired position. Allows easy cleaning.

(6) Sill Section of Zee Bars—Showing the wide double contact weathering.

(7) Artistic Handle—Standard black lacquer finish; also chromium, Butler nickel or solid bronze.

(8) Vertical Meeting Rail—Providing maximum weathering, insulating air space and rigidity.

(9) Muntin Intersections—Made with a mitered and mechanically interlocked joint with a neat, flush surface on the inside. Vertical and horizontal muntins are of the same size.

(10) Zee Bar Sections—Used for outside frame members of all combinations and around swing portion of casement.

Casement Rol-up Screens

The Truscon Rol-up Screen is a handsome, efficiently operating, durable accessory that rolls up out of sight when not in use, thus protecting the screen against wear, the elements and possible damage and does not obstruct the light. It is economical in cost and with proper care will give a lifetime of service.

The screen fits flush against the casement frame and requires no cutting, special moulding or fitting. Installation requires merely the drawing up of 6 screws in the casement frame and the screen can be removed just as easily. Rol-up Screens are thoroughly in keeping with the architectural beauty of the casement. Inconspicuous slender guides and a small housing blend in perfectly.

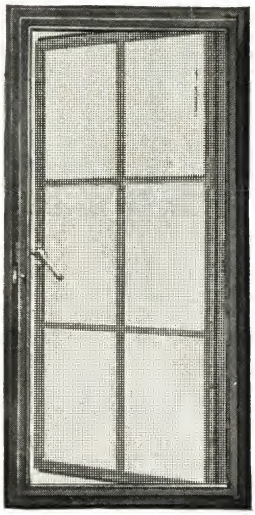
Condensed Specifications—

(1) Screen Material—(A) All sheet metal parts shall be hot galvanized steel.

(B) Bearings, where required, shall be solid bronze.

(C) Wire cloth shall be 16-mesh antique finish bronze.

(2) Screen Construction—(A) Housing shall have chamfered corners formed from 22-gauge galvanized steel with neatly fitting end caps. End caps shall carry telescoping projections snugly fitting into upper ends of guides to provide adjustability of length.



(B) Guides shall be $\frac{11}{16}$ in. wide by $\frac{33}{64}$ in. deep, made of 20-gauge steel and designed to interlock with the bottom rail of screen.

(C) Bottom rail shall be equipped with a positive locking device and have a Flexo Rubber Cushion for stool contact.

(D) Roller mechanism shall be all metal, with a $\frac{3}{8}$-in. solid steel mandrel running entire length of roller, special bronze bearings and "music wire" tension spring capable of maintaining a sufficient and constant pull.

(3) Screen Painting—Screens shall be finished in blue-black Duco.

Side-Hinged Screens

For hospitals, offices, apartment hallways and general screening purposes, where low cost, performance and simplicity of operation are all required, the Truscon Side-Hinged Screen makes an excellent installation. Screens fit flush against the casement frame so that no special window construction is necessary, and no special fitting, carpenter work or mouldings are required.

Truscon Side-Hinged Screens are made in standard sizes, with the result that screens for similar sized openings are completely interchangeable. They are removed and replaced without the slightest effort and are extra sturdy to resist possible damage.

Condensed Specifications—

(1) Screen Material—(A) Frame shall be made of cold-rolled galvanized steel.

(B) Wire cloth shall be 16-mesh, antique finish, solid bronze.

Frames of aluminum or bronze and wire cloth of aluminum, Monel or bronze other than 16-mesh can be furnished.

(2) Screen Construction—(A) Screen shall be of standard flat type.

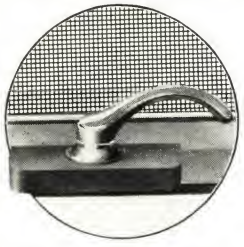
(B) Screen frames shall be of tubular construction; all corners shall be reinforced or welded.

(C) Removable spline shall be provided so as to permit re-screening.

(D) Pivot rods shall be provided at each end. The lower pivot shall be of plunger adjustable type so that the screen can be removed easily.

(3) Screen Hardware—Bronze spring catch and extended keeper, together with pivot brackets, shall be supplied and shipped with all screens.

(4) Screen Painting—All casement side-hinged screens shall receive one standard shop coat of paint.

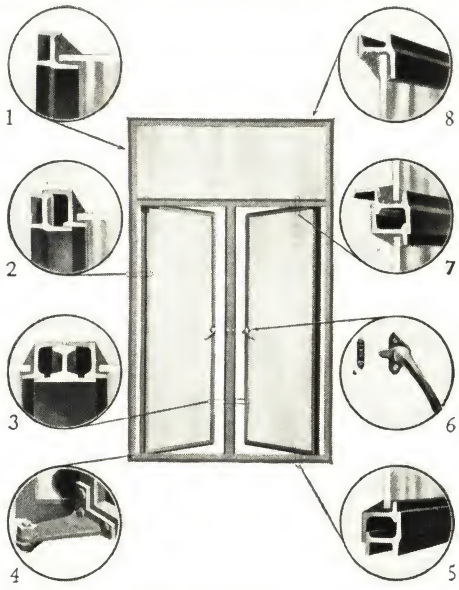


Artex Under-screen Operator Installed

Note how inconspicuous it is, and how convenient its size and location

Artex Under-screen Operator

An exclusive automatic device for the positive operation of the casement through the screen. It is compactly built so that no part of it protrudes beyond the sill to become an obstruction when restricted ventilation is required. Operation is so simple and efficient that merely a turn of the handle gives the desired degree of ventilation; at the same time, the casement is automatically locked in any open position and can be moved only by means of this handle. The bronze screen used with the Artex Operator is standard in construction and is held in place by special clips. A cam locking handle is applied directly to the casement frame, engaging between the frame and the vent.



TRUSCON ARCHITECTURAL CASEMENTS

Series 15

Foreword

The Architectural Casement, Series 15, has been designed to fill the need of a heavier type of casement for better class residential and apartment work. These windows lend themselves to the latest architectural developments and can be adapted to meet any desired specification.

Units, when shipped to the job, are completely assembled and painted, ready to be set into the opening. Casements may be either single or double; the double units may be modified to include hopper vents or transoms or both. In any case, the casement is constructed within one complete frame, having continuous frame sections that are mitred and butt welded at the corners. All sections are copper-bearing steel and perfect double flat contact weathering is maintained throughout of not less than ⅞ in. between sash and frames.

Construction Details

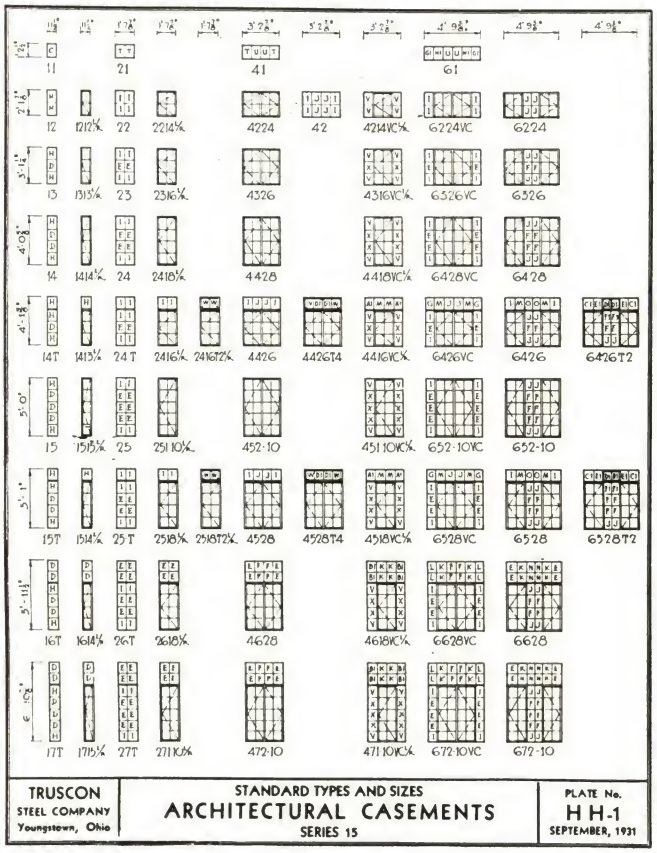
(1) Jamb Section—Cross section of continuous frame member at jambs. All corners of frame are mitred, butt welded and ground smooth before assembly.

(2) Jamb Section Through Frame Member and Ventilator Section—Showing positive ⅞-in. double contact weathering.

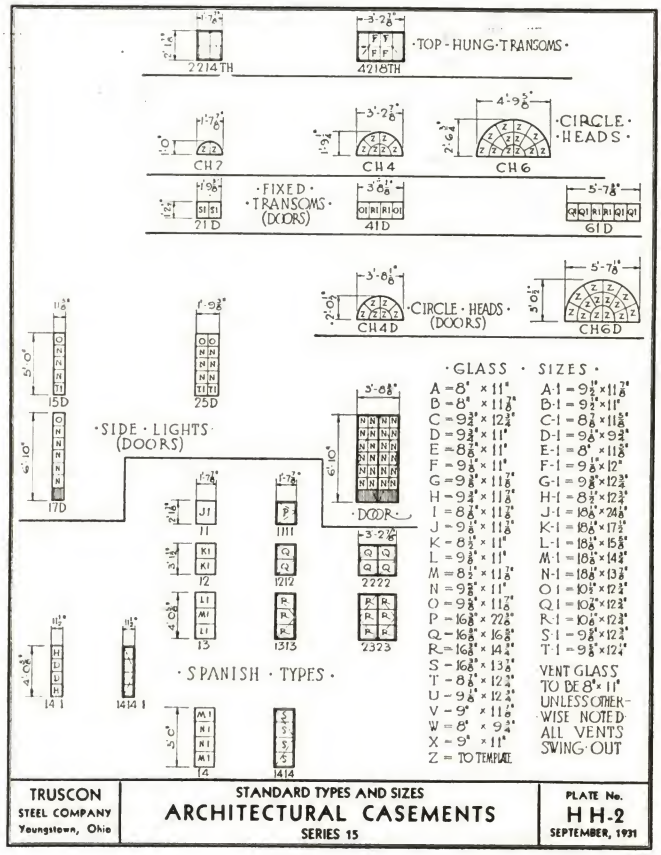
(3) Vertical Meeting Stile Between Swing Casements—Note Heavy Tee section, flush on inside with frame, compact assembly and ⅞-in. positive double-contact weathering.

(4) Extension Type Friction Hinge—Permits easy cleaning of windows, inside and out, and holds ventilator in any desired position without the use of an adjuster. Bronze bushings assure long wear.

(5) Sill Section—Cross section through bottom rail of ventilator and frame section, showing ⅞-in. positive double-contact weathering.



(6) Cam Latch Handle and Strike—For swing-out casements, in malleable iron, black finish; or U. S. Standard No. 11 cast bronze antique finish, at slight additional cost.



(7) Detail of Transom Bar—With fixed transom light above and ventilators below, showing ⅞-in. double-contact weathering.

(8) Head Section—Cross-section of frame at head when fixed transom light is required. Frame section continuous from jamb to jamb.

Aluminum Architectural Casements, Series 15

Where the character of the installation is such that only the very finest materials are desired, Truscon Aluminum Architectural Casements will be found most fitting. The sections are solid, one-piece extruded aluminum and the construction of the casements is of unsurpassed craftsmanship. Hardware is beautifully designed and finished in cadmium plate, or made of cast aluminum. The types, sizes and details are comparable to the steel Architectural Casements, although the sections are necessarily greater because of the difference in the tensile strength of the two metals. Thus, the architect has the same wide selection in aluminum as he has in steel.

TRUSCON MONUMENTAL CASEMENTS

Series 15-C

Foreword

The Monumental Casement, Series 15-C, is, as its name implies, a window suitable for installation in buildings of a monumental character. The sections are especially heavy and the entire window imparts a feeling of massiveness and strength thoroughly in keeping with the types of buildings for which it was developed. A wide application will also be found in fine residences, apartments, office buildings and public and educational buildings. Pressed steel frames, designed to harmonize with the architectural treatment of monumental buildings, are available when desired. Numerous arrangements are possible and they can be adapted to meet any desired specifications. Superior quality, fine workmanship and modern design are among the features.

Construction Details

(1) Head of Ventilation Transom—Cross section showing heavy thickness of metal with built-up baffle for weathering.

(2) Transom Bar Between Swing Casement and Transom—Cross section showing heavy Tee cross bar, compact assembly and correctly designed drip section.

(3) Jamb of Ventilated Casement—Cross section showing features similar to head section.

(4) Meeting Rail Between Hopper Vent and Swing Casement—Cross section showing special Tee cross bar, against which vent rails contact at two points each—four points in all. It is a compact assembly needing no drip section.

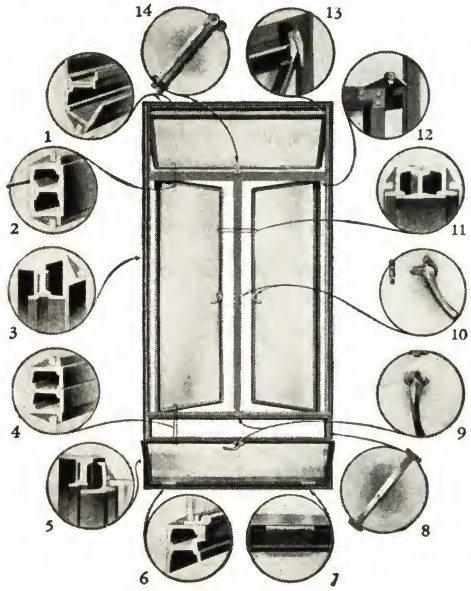
(5) Jamb of Hopper Vent—Cross section showing features similar to jamb just above, but with baffle and vent reversed.

(6) Sill of Hopper Vent—Cross section showing frame section similar to head. Hinge applied in the most direct and simple manner, half-concealed.

(7) Hinge—Direct view showing five-knuckle 3½-in extruded bronze hinge with $\frac{5}{16}$-in. cold-rolled steel pin. Hinge screwed to frame and ventilator so that no screw heads are visible.

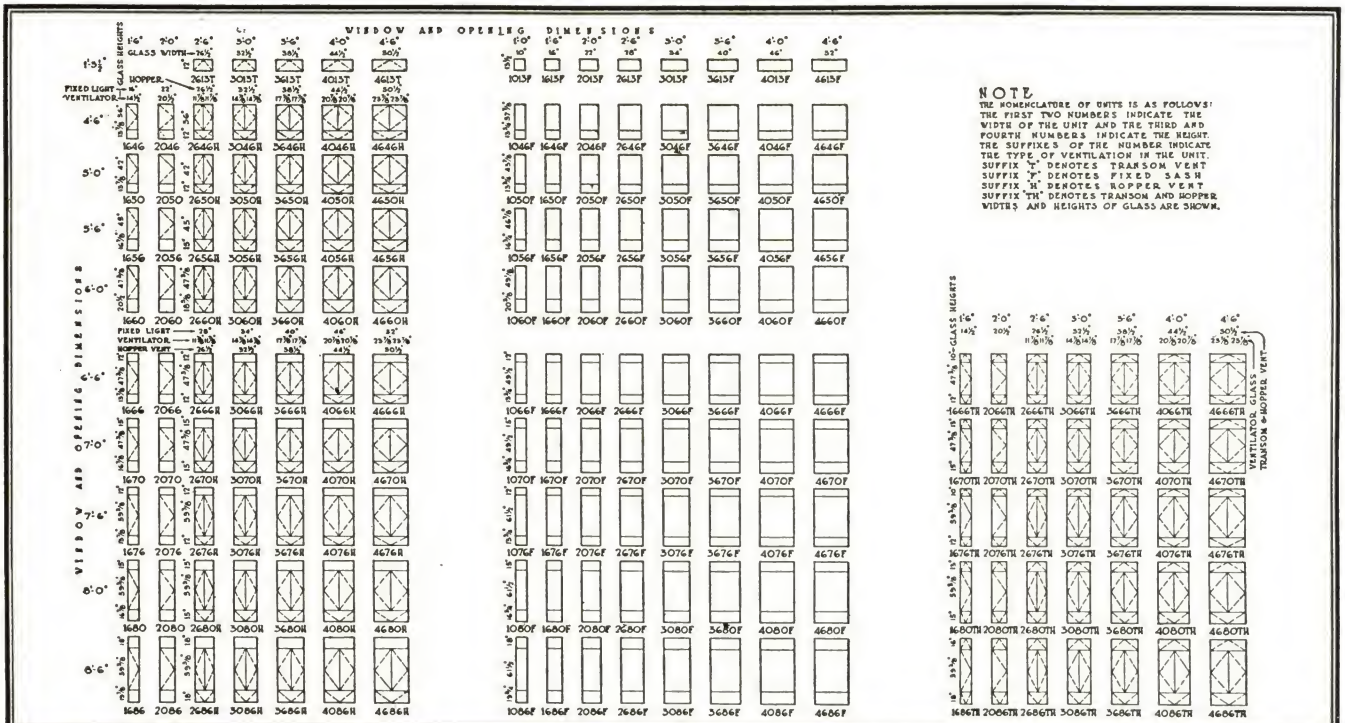
(8) Vent Stop—Direct view of bronze vent stop, concealed in stile. Controls swing of hopper vent.

(9) Latch and Strike—Direct view of forged bronze latch and strike for inswinging hopper vent. Bronze flathead countersunk machine screws are used.



(10) Latch and Strike—Direct view of forged bronze latch and strike for out-swinging casements.

(11) Meeting Stile Between Swing Casements—Cross section showing heavy Tee section flush on inside with frame. Similar to transom bar.



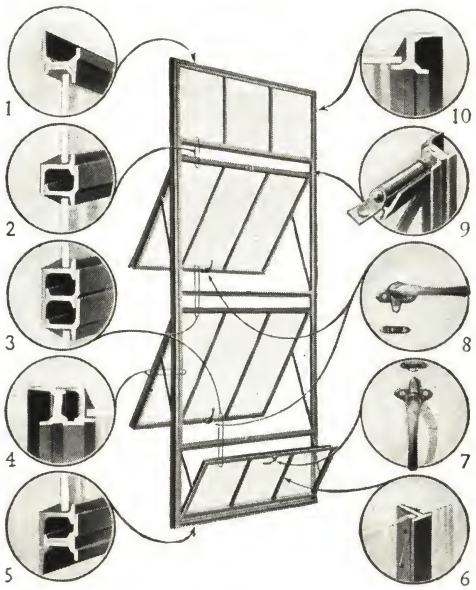
(12) Extension Type Friction Hinge—Bronze bushing holds the out-swinging casement in any desired position. Cleaning of outside of glass made easy.

(13) Short Friction Hinge—For transoms—welded to frame and riveted to vent. Steel friction bolt combined with bronze washers and cadmium plated spring steel washer. Holds transom in any desired position.

(14) Push Bar—For use with transom vents. Holds transom open in any desired position and may be operated with window pole. Bar support and bar are bronze.

Note: There is a $\frac{3}{8}$-in. double contact weathering between vent and frame. (1) At head. (2) At both top side and under side of transom bar. (3) At jambs of casement, at both sides of meeting stiles between swing casements. (4) At jambs of hopper vent. (5) At sill of hopper vent. (6) At both top and under side of cross bar of meeting rail between hopper vent and swing casement.

MONUMENTAL CASEMENTS



TRUSCON MONUMENTAL PROJECTED STEEL WINDOWS

Series 15-P

Foreword

These windows are especially adapted for use in buildings of a monumental type, and throughout the entire design there is an architectural harmony and mechanical perfection seldom found even in the most exclusive custom-built job.

Continuous frame sections in standard designs exclude the necessity of built-up assembled units, making a very rigid installation and preventing the possibility of bowing or misalignment. Hopper vents at bottom of window eliminate the need of window guards.

These windows give complete control of ventilation, for the ventilators may be set at any angle. Narrow steel members give the maximum amount of daylight possible from the masonry opening. The friction device that holds the vents open is of bronze, insuring against wear and corrosion, and is adjustable. Cleaning of the outside glass is easily accomplished from the interior.

All sections are made of hot-rolled copper-bearing steel. Units are square and true, with a perfect ⅜-in. flat double contact weathering maintained throughout between the sash and frame. All corners are electrically welded and ground smooth. Hardware is of artistic modern design, either made of U. S. Government specification No. 11, cast bronze or malleable iron, black finish.

Construction Details

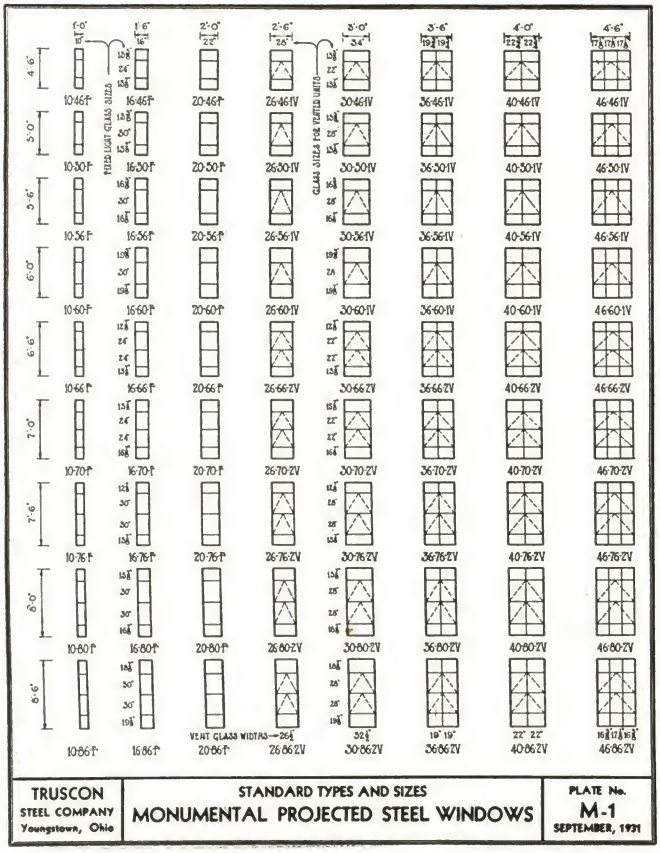
(1) Head Section—Showing built-up section, similar for both head and jamb at fixed sash.

(2) Section Through Head of Vent—With fixed sash above and ventilator below showing ⅜-in. double contact weathering.

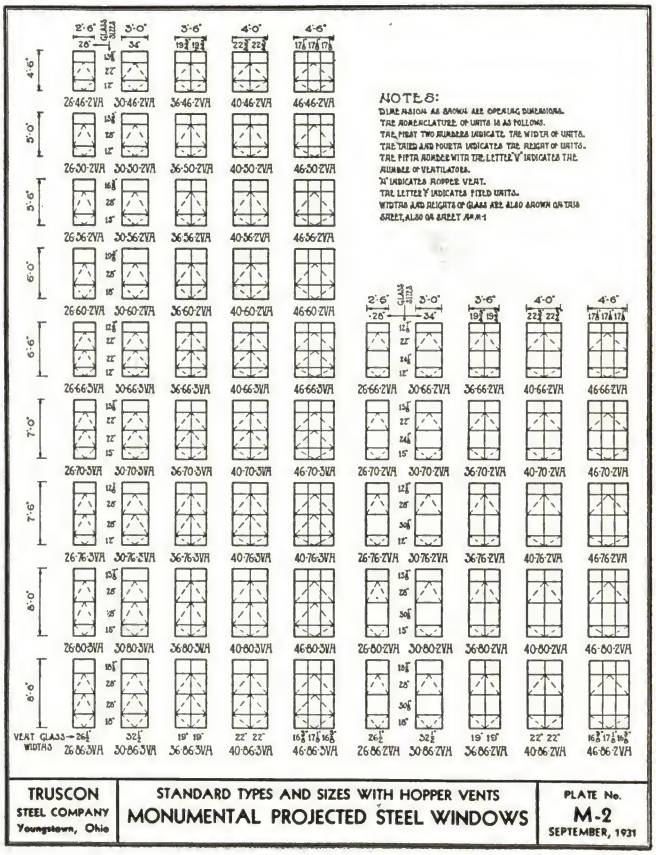
(3) Section Through Meeting Rail—Between two projected vents showing ⅜-in. double contact weathering in each case.

(4) Jamb Section Through Down and Out Vent—Showing built-up frame and ⅜-in. double contact weathering.

(5) Section at Sill with Hopper Vent Above—Showing built-up frame and ⅜-in. double contact weathering.



(6) Cross Section Through Tee Muntin Bars—Showing outside putty glazing with spring clips.



(7) Latch, Handle and Strike for In-Swing Hopper Vent—Showing standard bronze forgings (Assembly P-3300).

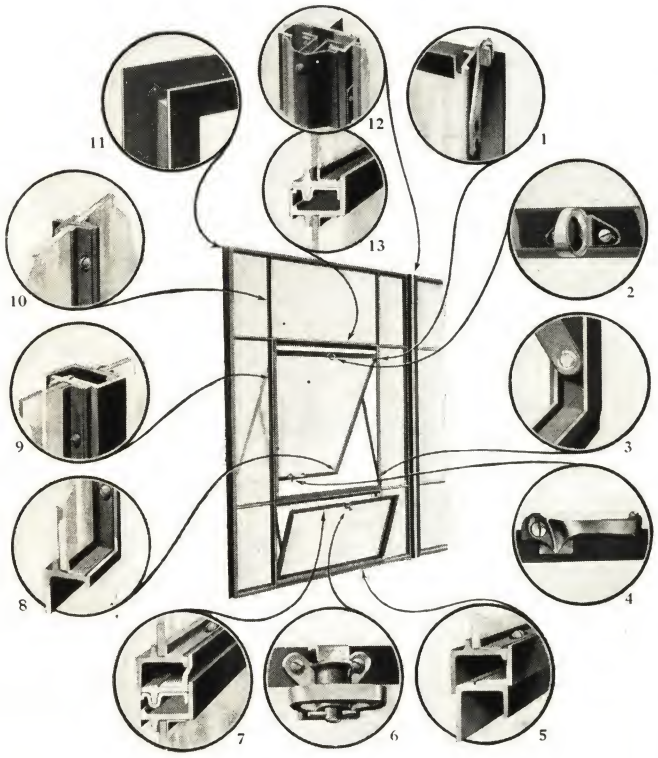
(8) Latch, Handle and Strike for Open-Out Ventilators—Showing standard bronze forgings (Assembly P-3301).

(9) Sliding Pivot—Showing vertical sliding adjustable brass friction shoe.

(10) Jamb Section at Fixed Lights—Showing built-up section.

TRUSCON ARCHITECTURAL PROJECTED STEEL WINDOWS

Foreword



Truscon Projected Steel Windows—Architectural Type, are designed for appearance as well as practicability. They are furnished in a wide variety of types and sizes, combined as desired, enabling the architect to choose the exact window that will best harmonize with his building design.

By means of an outside frame that is formed of a heavy channel, these windows emphasize the massiveness that is basic in the design of so many modern buildings. Their slender steel muntin bars impart to projected windows a delicate beauty without sacrificing strength or daylighting.

Glazing angles, which are standard with Truscon Projected Windows—Architectural Type, also enhance the appearance of the window, as does the practice of using large glass sizes. Heavy bronze hardware completes the window's luxuriousness.

Ventilation is entirely controllable, as the ventilators may be opened to any desired degree. These windows, obtainable with either in-swinging or out-swinging ventilators, admit plenty of air and deflect it so as to protect the occupants of the room from draughts.

Weathertightness is assured by the rigid construction of the window and the Truscon double contact weathering.

Construction Details

(1) Solid Brass Sliding Pivot—Glazing ledge of sash section acts as guide, eliminating recess for collection of dirt and ice. Coil spring provides tension.

(2) Bronze Pole Hook Ring—Allowing operation of outswing ventilators, out of reach from floor, with window pole.

(3) Heavy Brass Bushed Pivot—$\frac{3}{16}$x1-in. supporting arms concealed when ventilator is closed.

(4) Locking Handle—Designed with strike plate of solid bronze.

(5) Double Contact Weathering—Through ventilator at sill.

(6) Automatic Spring Latch—Of solid bronze for ventilators opening in for hand or pole operation.

(7) Double Contact Weathering—Through sill of outswinging and head of in-swinging ventilators.

(8) Ventilator Frame—Rigid angle section, mortised and tenoned, electrically welded and ground smooth.

(9) Double Contact Weathering at the Jambs.

(10) Continuous Metal Glazing Angles—Glass is bedded in Truscon Steel Window putty and held in place with glazing angles attached to sash with brass bolts.

(11) Corners—Heavy frame members of unequal leg channels are mortised and tenoned, electrically welded and ground smooth.

(12) Vertical Mullions—Exterior Tee-bar with pressed metal interior cover to give rigidity and pleasing appearance.

Condensed Specifications

(1) General—All windows so indicated on the plans and elevations and called for in these specifications shall be the Architectural Projected Type as manufactured by the Truscon Steel Company of Youngstown, Ohio.

(2) Construction—All joints shall be mortise and tenon, and air-hammer riveted.

(3) The four corners of all ventilators and sash shall be welded and ground smooth.

(4) The intersection of horizontal and vertical muntins shall have a dovetail miter, rigidly interlocking the bars.

(5) No excess metal or projecting surfaces shall be permitted where muntin bars intersect.

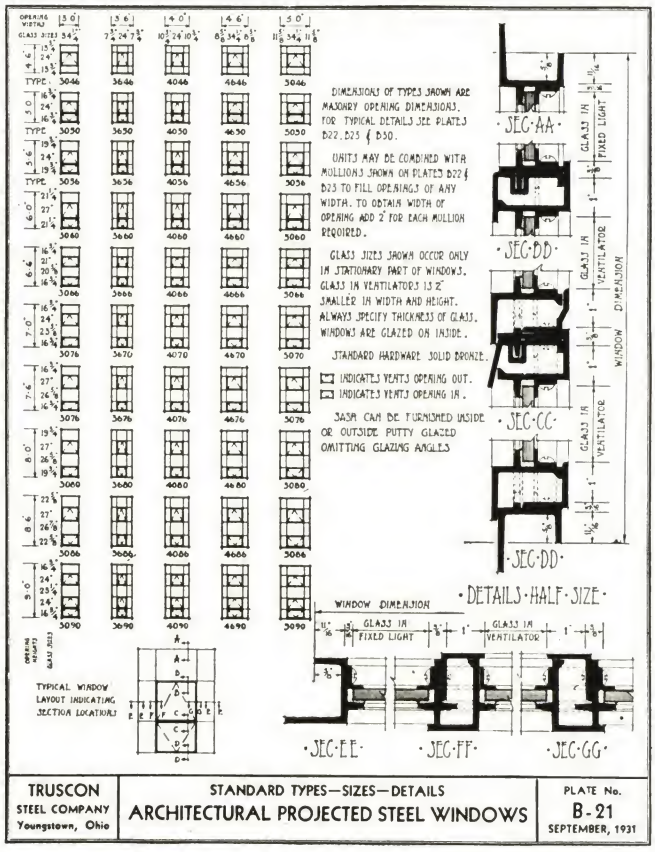
(6) Muntin bars except where ventilators occur shall be continuous from head to sill and from jamb to jamb.

(7) Ventilators shall have double contact weathering on all four sides.

(8) The sliding pivots shall be constructed of forged brass.

(9) The outside section of the window shall be a heavy, solid rolled copper-bearing steel channel (210-A or 210-B section).

(10) The side of the window or ventilator frame shall act as a guide for the sliding pivot, and shall be constructed without recess or slot.



(11) Uniform tension to hold ventilators in any desired position shall be gained by the use of a spring applied between sliding pivot and ventilator.

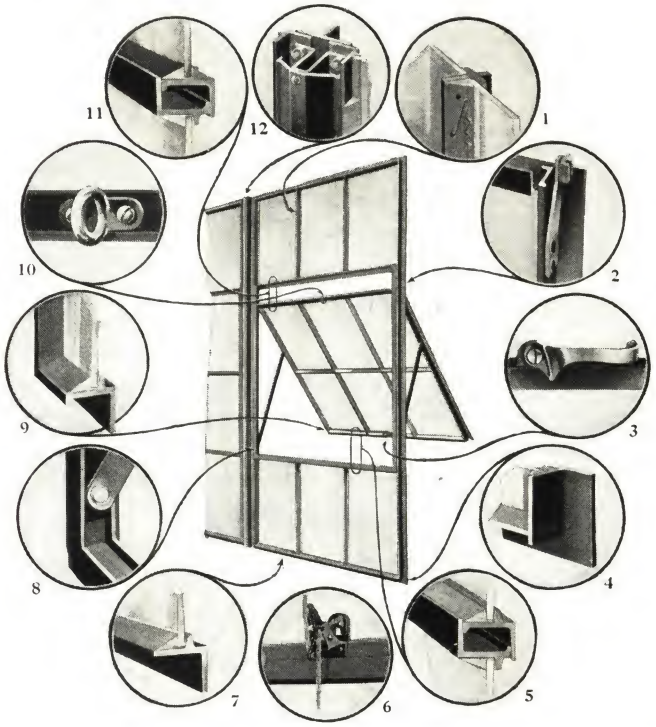
(12) There shall be two heavy supporting arms attached to the ventilator and frame designed to be concealed when ventilator is closed. The rivet holes in supporting arms shall have brass bushing.

(13) Ventilators Projected Out when opened shall have no part of the ventilator projecting inside the normal plane of the windows.

(14) Ventilators Projected In shall not project outside the normal plane of the windows.

(15) Hardware shall be bronze throughout.

TRUSCON PROJECTED STEEL WINDOWS—COMMERCIAL TYPE



Foreword

Where neat design and economy are the keynote of the construction, architects will appreciate the quality, appearance, performance and low cost of Truscon Commercial Projected Windows.

These windows are widely used in garages, filling stations, printing plants, warehouses and shops of all kinds. The projected feature is especially valuable when ventilation depends upon the natural clearing off of vapor, smoke and stale air. The tilted ventilator acts as a deflector of the elements and can be kept open in all kinds of weather. Direct drafts are eliminated and a continuous change of air is obtained.

Because of the similarity between the appearance of the Commercial Projected and Pivoted Windows, the Projected Windows can be used in the office section of an industrial plant with complete conformity to the general design.

Twenty-nine standard types of Truscon Commercial Projected Window, as shown in the plate below, are available in either 12x18-in. or 14x20-in. glass size, many of which are carried in warehouse stocks. Types which open out can be supplied with the National Board of Fire Underwriters' Label.

Construction Details

(1) Glazing—Glass is bed and face puttied and held in place with clips; staggered holes and flexible clips allow various thicknesses of glass.

(2) Forged Brass Sliding Pivot—Glazing ledge of sash section acts as guide, eliminating recess for collection of dirt and ice.

(3) Locking Handle—Of malleable iron, sherardized.

(4) Corner Construction—Heavy frame members of unequal leg channels are mortised, tenoned and air-hammered.

(5) Weathering at Sill—Double contact weathering makes tight fit and assures weather-tightness.

(6) Automatic Chain Latch—Automatic kick-out allows operation by chain when ventilator is out of reach from floor.

(7) Frame—Heavy angle section at head, sill and jambs, mortised and tenoned, electrically welded and ground smooth.

(8) Supporting Arms—Heavy pivots are brass bushed. The $\frac{3}{16}$x1-in. supporting arms for ventilator are concealed when ventilator is closed.

(9) Ventilator Frame Corner—Heavy, rigid angle section, mortised and tenoned, air-hammer riveted and ground smooth.

(10) Pole Hook Ring—To be used with window pole.

(11) Weathering at Head—Provides double contact at two points.

(12) Vertical Mullion—Exterior Tee-bar to give necessary rigidity, with pressed metal cover on the inside to give pleasing appearance.

Condensed Specifications, Commercial Projected Windows

(1) General—All windows so indicated on the plans and elevations and called for in these specifications shall be the Commercial Projected type as manufactured by the Truscon Steel Company of Youngstown, Ohio.

(2) Construction—All joints shall be mortised and tenoned and air-hammer riveted.

(3) The corners of all ventilators to which pivots are attached shall be welded.

(4) The intersection of horizontal and vertical muntins shall have a dovetail mitre, rigidly interlocking the bars.

(5) No excess metal or projecting surfaces shall be permitted where muntin bars intersect.

(6) Muntin bars, except where ventilators occur, shall be continuous from head to sill and from jamb to jamb.

(7) The members of the windows shall not be bent or deformed during process of manufacture.

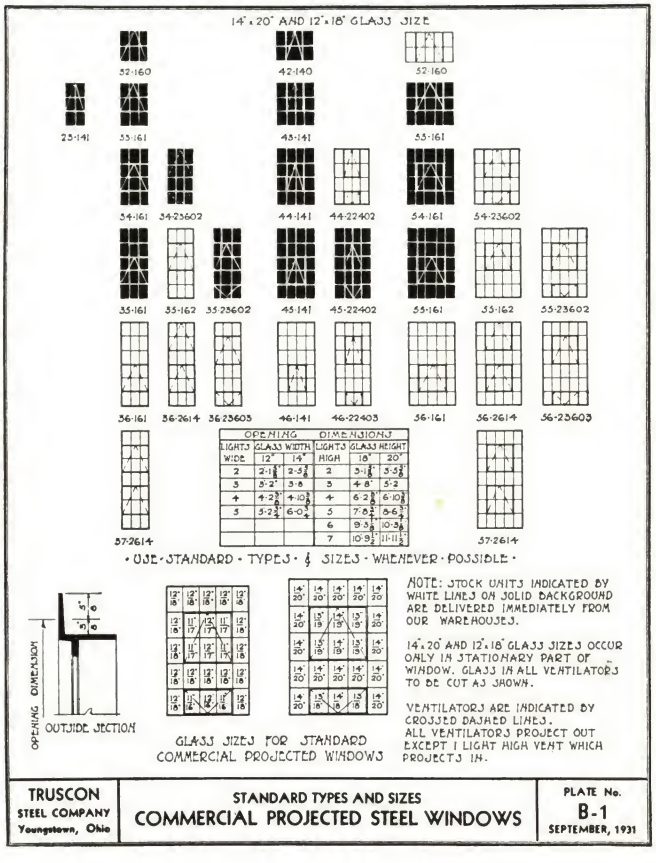
(8) Ventilators shall have double contact weathering on all four sides.

(9) The sliding pivot shall be constructed of screw stock brass.

(10) The side of the window or ventilator frame shall act as a guide for the sliding pivot, and shall be constructed without recess or slot in which dirt or ice may collect, to interfere with the free movement of the ventilator.

(11) Uniform tension to hold ventilator in any desired position shall be gained by the use of a spring applied between sliding pivot and ventilator.

(12) There shall be two heavy supporting arms attached to the ventilator and frame, designed to be concealed when ventilator is closed. The rivet holes in supporting arms shall have brass bushings.



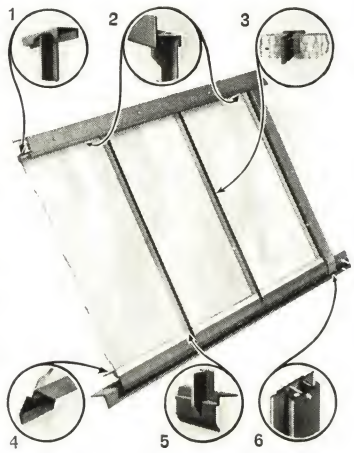
(13) Ventilators Projected Out, when open, shall have no part of the ventilator projecting inside the normal plane of the window.

(14) Ventilators Projected In shall not project outside the normal plane of the window.

Truscon Utility Steel Windows

An economical type of Projected Window made in one standard size, 3 ft. 3¾ in. wide by 3 ft., 7⅞ in. high. They are well designed, made of hot-rolled steel and have strength to withstand hard usage. Double contact weathering on all sides insures weather-tightness. Brass friction shoes rigidly hold the ventilator in any desired position, eliminating the use of chains or push bars; a cam latch handle being the only hardware required for opening, closing and locking the window.

TRUSCON CONTINUOUS STEEL WINDOWS



Foreword

Truscon Continuous Steel Windows are ideally suited for use in industrial plants where the nature of the factory work requires frequent and rapid ventilation of the building. They are also most practical for any buildings having monitors or saw-tooth faces, or where banks of windows reach considerable heights, necessitating remote control for operation, and are particularly valuable where large areas are enclosed which cannot be satisfactorily lighted through the side walls.

The scientific application of Continuous Windows to a building insures maximum daylight and gives absolute control of temperature and ventilation, resulting in a marked effect on increased efficiency and reduction of production costs. The quick opening and closing of glass areas by means of mechanical operation is invaluable to clear out gases, smoke and excessive heat and to protect against sudden change in weather.

Pressed Steel Frames

In structures such as power houses and pumping stations, the effect desired usually is that of massive strength. This is provided by Truscon Pressed Steel Frames, which are designed to harmonize perfectly with the massive lines of the building, and which have the strength, permanence and dependability suggested by their appearance.

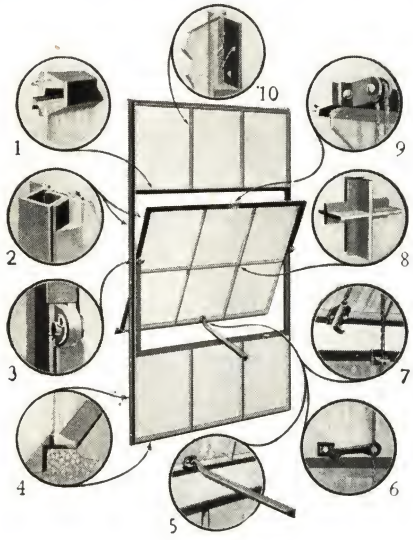
Construction Details

(1) **Welded Mortise and Tenon Joint** — Prevents twisting.

(2) **Hinge Member**— Forms continuous bearing giving perfect weathering.

(3) **Glazing Clips** — Of heavy brass on vertical muntin bars.

(4) **Wide Flange** — For the attachment of mechanical operator.



(5) **Mortise and Tenon Joint**—Showing welding.

(6) **Vertical Expansion Mullion.**

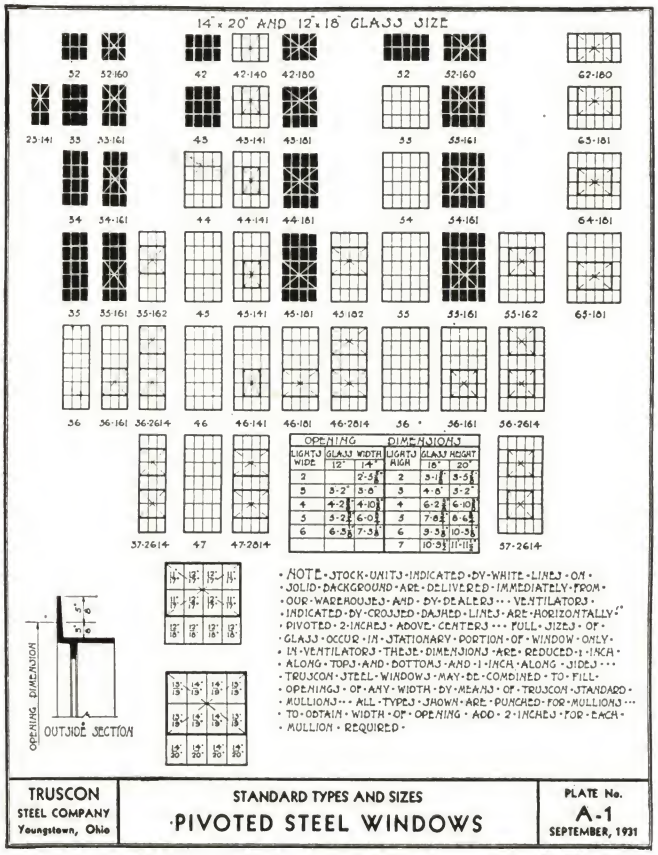
TRUSCON PIVOTED STEEL WINDOWS

Foreword

Proper light and flexible control of ventilation are obtained by use of Truscon Pivoted Steel Windows, adaptable to every type of industrial building. They are constructed of heavy, hot-rolled, rust-resisting steel sections, are permanent and fireproof, and will never stick, shrink or warp in any kind of weather.

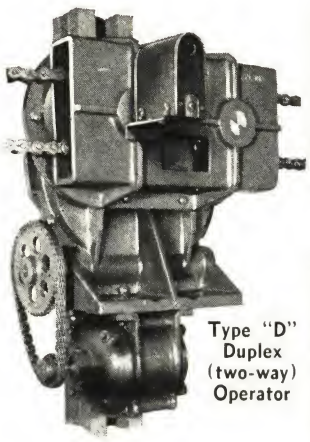
The outside section is of angle shape to allow 5/8-in. anchorage at the masonry or mullion connection. The intersection of the horizontal and vertical member is a dovetail mitre rigidly interlocking the bars. Slender muntin bars admit maximum daylight.

Ventilator operates easily at the touch on a cam-acting push bar if accessible from the floor, and otherwise by means of a spring latch and chain. The cam-acting push bar is standard equipment for all ventilators accessible from floor, the opening being adjusted by means of notches in the lower edge of bar which engage in the edge of the weathering member at bottom of ventilator to hold it open at any desired angle. Gravity cam latch and chain is optional equipment. A pull of the chain releases cam latch and opens ventilator. The spring latch and chain is also optional equipment. The ventilator is held in any desired position by engaging the chain in the chain hook.



Truscon Pivoted Steel Windows are glazed from the inside and glazing clips are supplied with them. Double contact weathering is provided on all four sides of the ventilator.

These windows can be supplied in a wide range of standard sizes and can be combined with standard mullions to fit almost any size window opening. Glass size in stationary portion of sash is 12x18 in., or 14x20 in." all lights at top and bottom of ventilator are 1 in. shorter and all lights at sides of ventilators are 1 in. narrower than in stationary portion of windows. Twenty types of sash illustrated in black in diagram are available for quick delivery from Truscon warehouse stocks. The other types are available for prompt shipment from the factory.



All windows are given one dip coat of protective paint before leaving the factory.

Construction Details

(1) Double Contact Weathering at Head.
(2) Double Contact Weathering at Jamb.
(3) Solid Steel Pivot with Removable Pin—Assures easy operation and durability.
(4) Heavy Angle Section at Sill and Jamb—Provides positive anchorage in masonry or mullion connections.
(5) Cam Acting Push Bar—Notched to engage edge of weathering member at bottom of ventilator and hold it open at any desired angle. The ventilator is securely locked by folding push bar back against sash and engaging in the cleat.
(6) Gravity Cam Latch and Chain—Tapped to bracket at sill of ventilator and securely held with a locking nut. A pull of the chain releases the cam latch and opens ventilator.
(7) Spring Latch and Chain—For use when ventilator cannot be reached from floor.
(8) Dovetail Mitre Joints at Muntin Intersections—Joists are skillfully fitted together and assure great strength and rigidity.
(9) Roller Bracket at Head of Ventilator—Used with chain operators.
(10) Spring Steel Wire Glazing Clips.

TRUSCON MECHANICAL OPERATORS

Type "D" Duplex (two-way) Operator

Truscon Mechanical Operators for opening and closing Truscon Continuous Steel Windows are furnished in either hand operated or power driven units. With the latter, a mere push of a button will instantly open or close a whole series of long run windows.

Type "G" Power Operator

Most frequently used for the control of long runs of Truscon Continuous Steel Windows. It is also used, however, with top and bottom hung continuous windows as well as with a side-wall tension operator, for the control of Center Pivoted Windows. This operator provides fast and smooth operation.

Type "GM"

The motorized form of Type "G" and has the advantage over the hand operated power of being more even and steady in operation, assuring preservation of all parts as well as adding to the life of the equipment and the sash itself.

Type "EM"

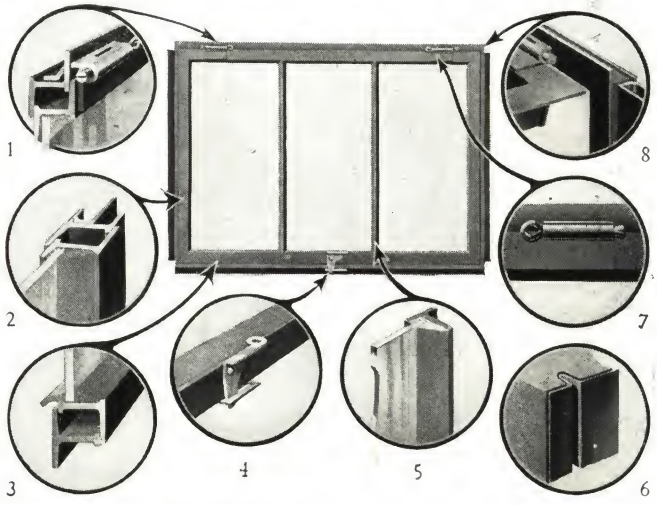
A heavy duty tension operator capable of handling continuous windows in runs up to 300 feet. Because of the additional load of long window runs, this model is designed for motor drive only.

Type "D"

Designed for the operation of especially long runs of continuous windows. It is mounted in the center of a run instead of at the ends, and controls the sash in both directions.

Master Control

Master control of groups of smaller stations is obtained by a switchboard which maintains temperature and ventilation under constant electric control.



TRUSCON BASEMENT WINDOWS, COAL CHUTES AND LINTELS

Truscon Basement Steel Windows

Truscon Basement Steel Windows satisfy the demands for performance, permanence and economy. They are made from heavy, hot-rolled sections and furnished completely assembled and painted, with removable pin hinge and cam acting latch. Corners of both frame and ventilator are butt-welded, giving added strength and preventing distortion.

Their narrow, extra rigid frame admits more light and the continuous, double contact weathering (an exclusive feature) makes them storm tight. They cannot warp, swell or stick, and can easily be screened.

They may be installed in concrete, masonry or any other type of construction.

FOUR STANDARD SIZES OF TRUSCON BASEMENT STEEL WINDOWS

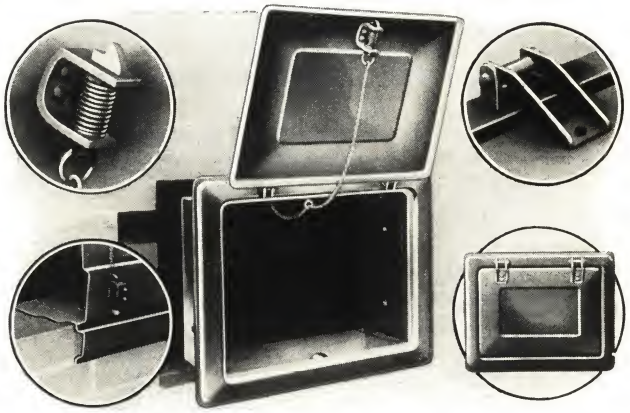
Window opening, in.	Lights wide	Glass size, in.
33½x15	3	10x12
33½x23	3	10x20
31¼x23	2	14x20
39½x21	3	12x18

Construction Details—*(1) Head*—Double contact between the ventilator and frame members assures absolute weathertightness when window is in closed position.

(2) Jamb—Double contact weathering, rigid Zee-bar section with additional channel section for anchorage. (Note how ventilator section holds putty in place.)

(3) Sill—Double contact weathering with additional projecting overhang drip absolutely preventing leakage.

(4) Cam Acting Latch—Operates free and easy, also assures positive lock and tight contact.



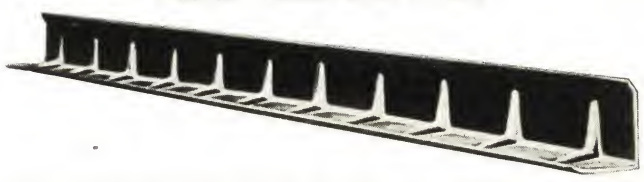
(5) Glazing—Putty on inside assuring security and pleasing effect from outside.

(6) End Plate—For use in concrete, making groove better to accommodate steel sash.

(7) Hinge—Removable pin type hinge specially formed to prevent rattling when closed. Hinges solidly welded to frame and ventilator.

(8) Corners—Zee-bar frame members and ventilator members are butt welded, making extremely rigid corners.

Truscon Pressed Steel Coal Chutes



The Truscon Pressed Steel Coal Chute meets the demand for an indestructible, neat appearing, efficiently operating coal chute for home use.

Being made of pressed steel, the Truscon Coal Chute is unbreakable, weathertight, thief-proof and of simple construction. The door and frame design develops maximum strength while keeping the weight of the unit to a minimum. The door is pressed out of a single piece of steel and the entire frame is electrically welded into one unit.

TWO STANDARD SIZES CARRIED IN STOCK

Frame: 27x21¼ in. Door opening: 22x16 in. Depths: 8 or 12 in. Weights: 33 or 39 lb.

Truscon Pressed Steel Lintels

Truscon Pressed Steel Lintels are light in weight, easy to handle, have maximum load capacity and are low in cost. They are strong, durable and rust-resisting. The turned edges give a neat appearance, and cross ribs placed at proper intervals give the maximum degree of rigidness to the lintel and ample support to the masonry above it.

3½x3½ in. x 11 gauge, weight 2.72 per lin. ft.
Standard lengths: 2 ft. 6 in., 3 ft. 0 in., 3 ft. 6 in., 4 ft. 0 in., 4 ft. 6 in., 5 ft. 0 in.

4x4 in. x 9 gauge, weight 3.91 lb. per lin. ft.
Standard lengths: 5 ft. 6 in., 6 ft. 0 in., 6 ft. 6 in., 7 ft. 0 in., 7 ft. 6 in., 8 ft. 0 in.

Products

VOIGTMANN HEAVY SECTION STEEL WINDOWS, DOUBLE HUNG.

VOIGTMANN HOLLOW METAL WINDOWS, DOUBLE HUNG.

VOIGHTMANN COPPER OR BRONZE WINDOWS, DOUBLE HUNG.

Tested and listed as standard by the Underwriters' Laboratories, Inc.

Also Radiator Hangers and Supports, Stools, Underwriters' Labeled Fusible Links and Window Ventilator Brackets.

Improved Features

New double weathering at all points of contact between sash and frame, adjusted to give maximum weather tightness.

Sash operate in double guides, assuring extremely smooth and easy operation.

Elimination of all exposed screws and simplified method of hanging and adjusting sash.

Architecturally correct and new design throughout, combined with smooth finish and first-class workmanship.

Neat Appearance

Voigtmann windows have neat and slender lines and present very pleasing appearance.

More Light

Voigtmann windows give maximum exposed glass area, due to these slender lines and narrow margins.

Better Weathering

Spring bronze weatherstrips at sill and meeting rails and double integral two-point contact weathering throughout entire perimeter of sash.

R. E. Olds Bank and Office Building, Lansing, Mich.
HOPKINS & DENTZ, Architects HUTTER CONSTRUCTION CO., Builders

SPECIFICATIONS FOR DOUBLE HUNG WINDOWS

Scope—All windows where shown on drawings to be double hung heavy metal construction as manufactured by Voigtmann Metal Window Corporation, of Kalamazoo, Mich.

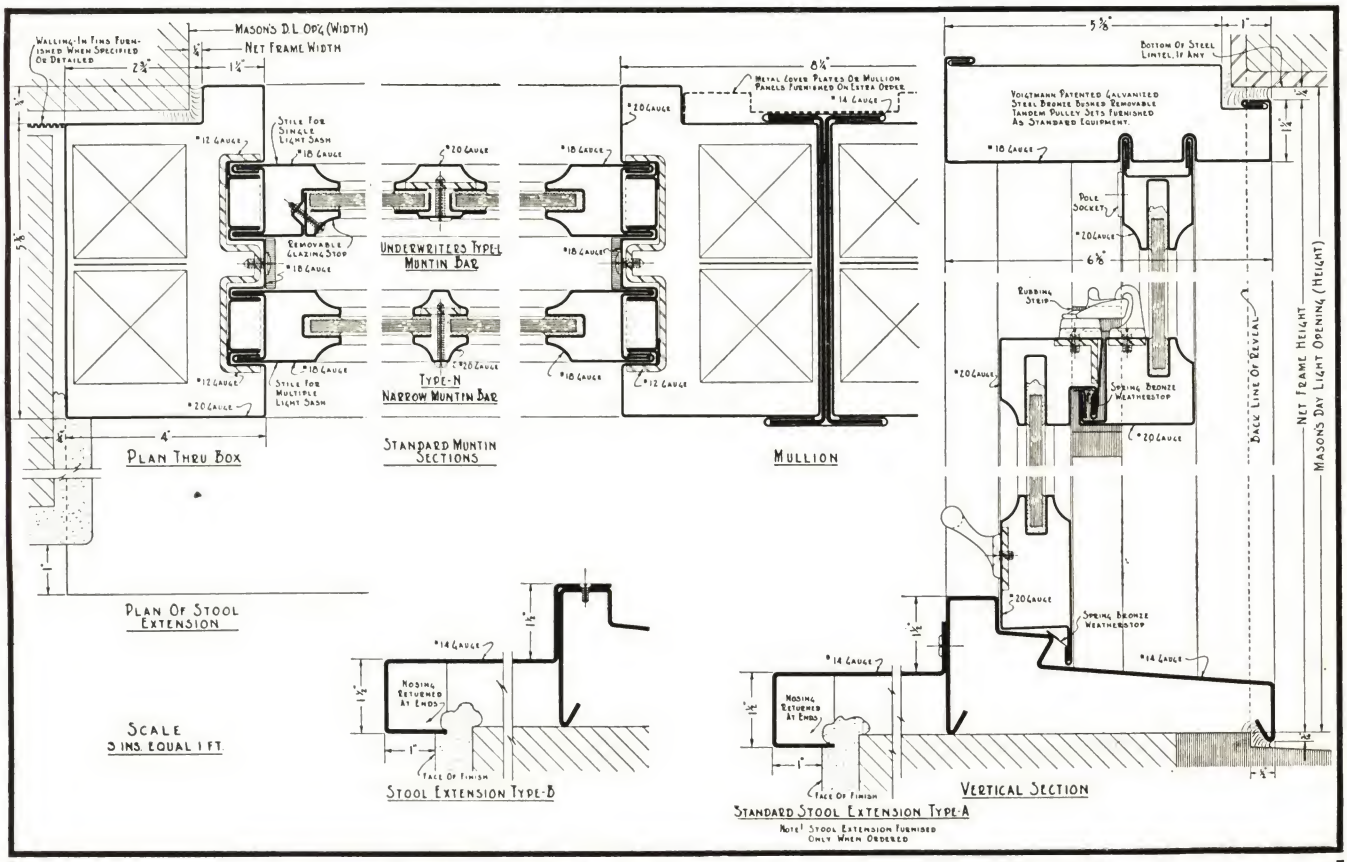
Material—All windows shall be constructed of hot-dipped galvanized steel, bronze or copper of gauges listed below.

Voigtmann Model 18V Heavy Metal Double Hung Windows—Sills shall be 14-gauge; pulley stiles, sash stiles and heads 18-gauge; jambs, sash rails and muntins 20-gauge.

Voigtmann Model 20V Double Hung Windows—Sills shall be 14-gauge; pulley stiles 20-gauge; jambs, heads, sash stiles, sash rails and muntins 24-gauge.

Voigtmann Model 20C Copper or Bronze Double Hung Windows—Sills shall be 32-ounce; pulley stiles 28-ounce; jambs, heads, sash stiles, sash rails and muntins 20-ounce, cold rolled copper or bronze.

Sash Construction—Sash shall be of moulded design. Sash stiles and rails shall be constructed of one piece of metal, closed construction, interlocked at seam, reinforced in tubular chamber by interlocking construction to insure great rigidity and uniformity. Joints between members shall be neatly mitred, lapped, spot welded and soldered absolutely watertight. Sash stiles and upper sash socket rail shall be formed to produce ¾-in. double interlocking flanges which shall engage in double weathering grooves. Meeting rails shall have channel flanges and interlocking spring bronze weatherstrip to insure weathertight contact. Lift rails shall be constructed with interlocked spring bronze weatherstrip to insure weathertight contact at sill. Glass rabbets in stiles and bottom rails shall be ¾ in. deep and those in top rails 1⅜ in. deep.



Frame Construction—Sills shall be formed with deep weather stops, ample drain pitch and without slots. Jambs, head and sill shall be constructed of one piece of metal exclusive of pulley stiles and closure strip. All members shall be formed true, neatly mitred, lapped, flush riveted and soldered watertight. Pulley stiles shall be rolled with ½-in. quadruple weather fins to form double slots and guides for each sash stile, removable to afford access to weight boxes and pulleys, and held in place with machine screws tapped to heavy adjustable reinforcing plates spanning the inside of jambs.

Muntins—Exterior muntin bars shall be moulded and reinforced with 12-gauge steel lugs. Interior removable caps shall be formed with offset bead and double flange putty stops.

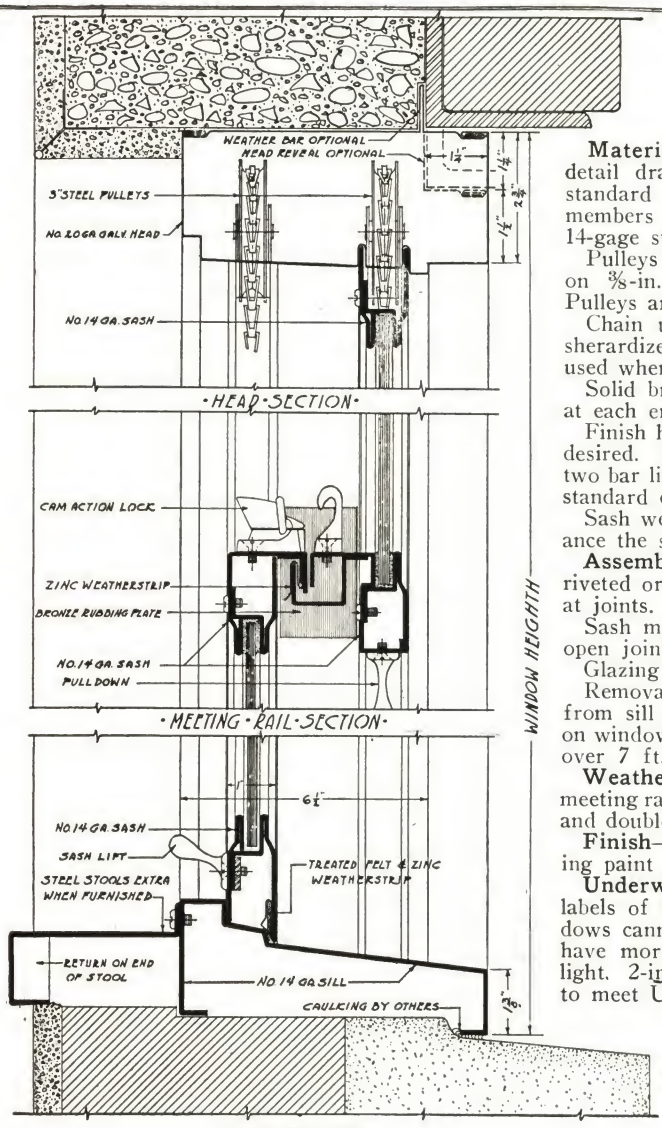
Hardware Equipment—Frames shall be equipped with 12 and 14-gauge galvanized steel tandem pulley sets. Wheels shall be bushed with 16-gauge seamless bronze cylinders and rotate on ⅜-in. steel axles. Pulley sets shall be adjustable, removable from frame and secured in place with machine screws. Pulley stiles shall be equipped with adjustable bronze rubbing strips to secure weathertight contact at ends of meeting rails. Sash shall be hung on galvanized steel chain No. 130 and properly counterbalanced by cast iron weights. Sash shall be equipped with one pair of moulded bar lifts, one sash lock and pole socket, polished bronze or iron plated as required, of Voigtmann standard design.

Painting—Frames and sash shall be given one coat of Voigtmann special prepared metallic gray primer sprayed on to completely cover all surfaces.

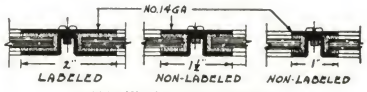
Labels—Where Underwriters' approval is desired their label shall be attached in evidence of their inspection and acceptance.

DETAILS OF THE VOIGTMANN MODEL 18V DOUBLE HUNG WINDOW

Note: Design and details for Model 20V and 20C are the same as Model 18V



INCORPORATED 1891



THE WILLIS MANUFACTURING COMPANY

Manufacturers of Double Hung Windows and Tin Clad Fire Doors

GALESBURG, ILL.

BRANCH OFFICES IN PRINCIPAL CITIES

Willis Paramount Double Hung Windows
No. 20-14 Double Plate Type

Materials—All parts are of gages and sizes as shown on detail drawings. Sills are of 14-gage galvanized steel as standard (12 or 16-gage when specified). Jamb and head members are of 20-gage galvanized steel, and sash are of 14-gage steel. All parts are fabricated from "Prime" sheets.

Pulleys have 3-in. pressed steel wheels with bronze bushings on ⅜-in. turned steel axles, and 14-gage steel housings. Pulleys are removable.

Chain used is American Chain Company's No. 130 with sherardized finish as standard. Other makes or finishes are used when specified.

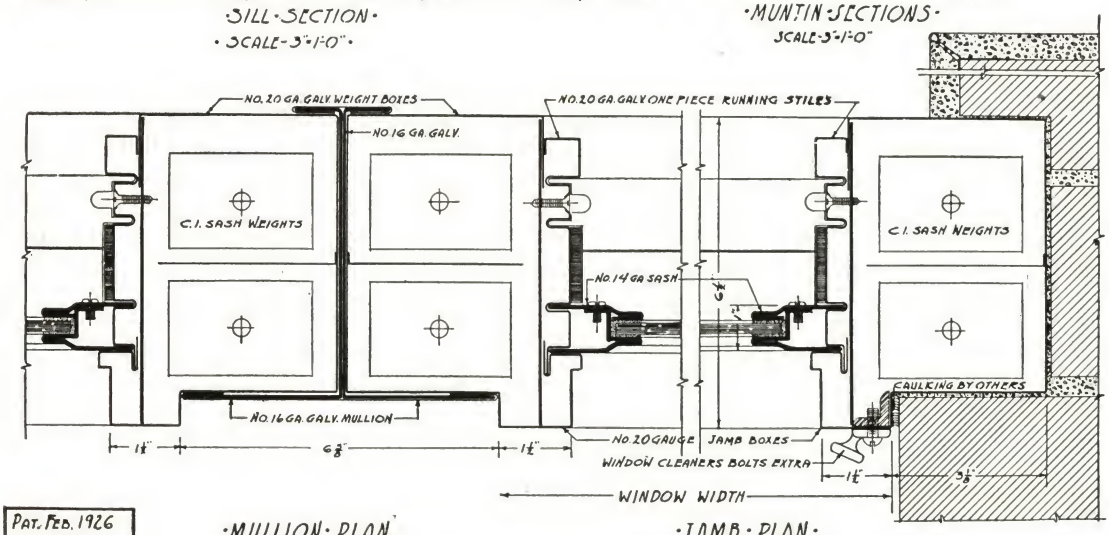
Solid bronze rubbing plates are attached to running stiles at each end of meeting rails.

Finish hardware is solid bronze or iron, bearing any plating desired. Each window is equipped with one cam action lock, two bar lifts, and one outside pull down, or pole socket of our standard design.

Sash weights are cast iron in sizes to properly counterbalance the sash.

Assembly—Frame members are assembled with butt joints, riveted or welded together by means of heavy backing plates at joints.

Sash members are mitered and welded at corners with no open joints.



Glazing strips are attached with screws as shown on detail.

Removable jamb running stile is in one piece extending from sill to head and is held in place by three screws only on windows up to 7 ft. 3 in. high and four screws on windows over 7 ft. 3 in. high. No screws are exposed to weather.

Weatherproofing—Consists of a zinc interlocking strip at meeting rail, combination zinc and waterproofed felt strip at sill, and double contact through rolled grooves at head and jambs.

Finish—All parts receive one coat best grade metal priming paint inside and outside at factory.

Underwriters' Labels—When required, windows may bear labels of the Underwriters' Laboratories, Inc. Labeled windows cannot exceed 6 ft. in width nor 10 ft. in height; nor have more than 720 sq. in. of exposed glass area in each light. 2-in. muntin bars and malleable iron locks are required to meet Underwriters' specifications.

PAT. FEB. 1926

Willis Paramount Double Hung Windows
No. 20-24 Hollow Metal Type

Materials—All parts are of gages and sizes as shown on detail drawings. Sills are of 14-gage galvanized steel as standard (12 or 16-gage when specified). Jamb and head members are of 20-gage galvanized steel, and sash are of 24-gage galvanized steel. All parts are fabricated from "Prime" sheets.

Pulleys have 3-in. pressed steel wheels with bronze bushings on ⅜-in. turned steel axles, and 14-gage steel housings. Pulleys are removable.

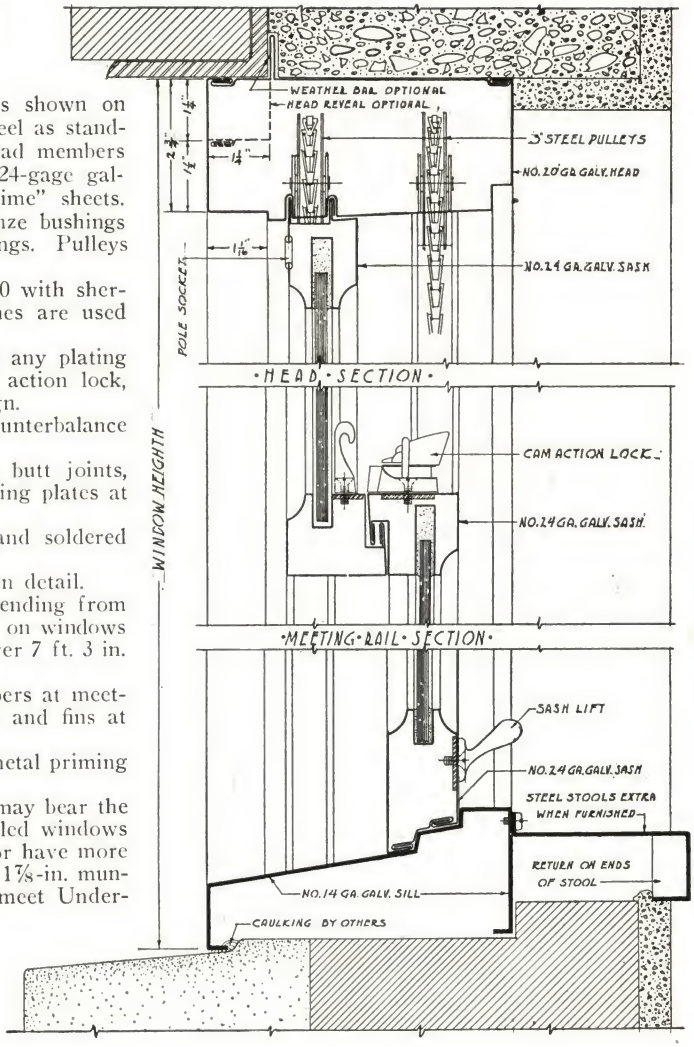
Chain used is American Chain Company's No. 130 with sherardized finish as standard. Other makes or finishes are used when specified.

Finish hardware is solid bronze or iron, bearing any plating desired. Each window is equipped with one cam action lock, two bar lifts and pole socket of our standard design.

Sash weights are cast iron in sizes to properly counterbalance sash.

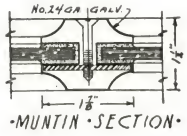
Assembly—Frame members are assembled with butt joints, riveted or welded together by means of heavy backing plates at joints.

Sash members have lap joints and are riveted and soldered at corners, with no open joints.



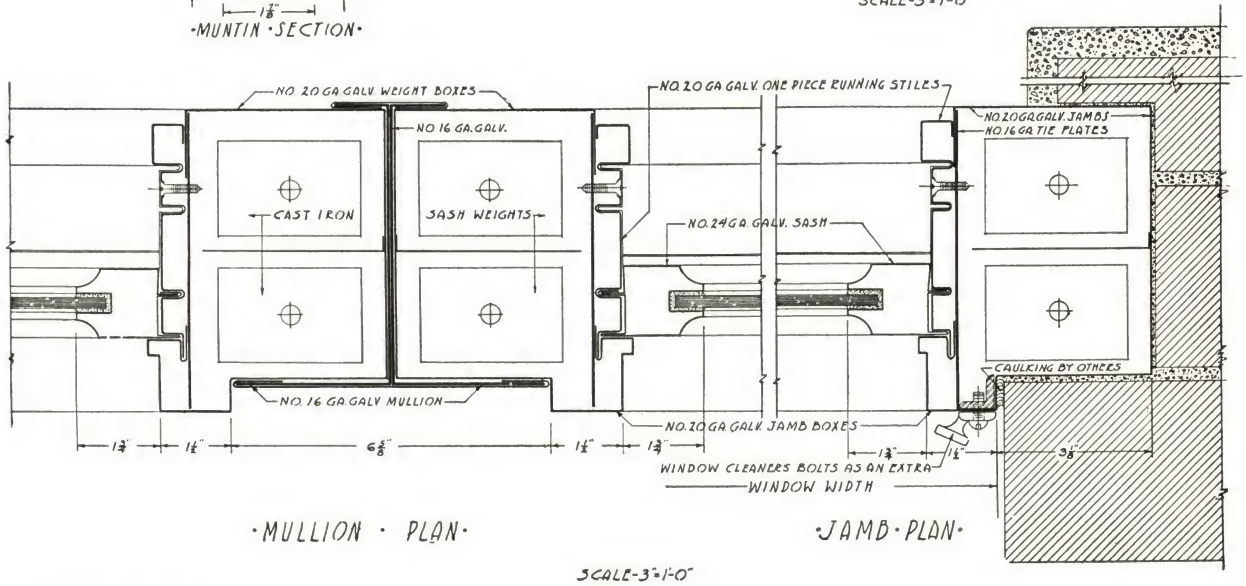
Muntin caps are attached with screws as shown on detail.

Removable jamb running stile is in one piece extending from sill to head and is held in place by three screws only on windows up to 7 ft. 3 in. high and four screws on windows over 7 ft. 3 in. high. No screws are exposed to weather.



Weatherproofing—Consists of interlocking members at meeting rail, double contact at sill, and double grooves and fins at head and jambs.

Finish—All parts receive one coat of best grade metal priming paint inside and outside at factory.



Underwriters' Label—When required, windows may bear the labels of the Underwriters' Laboratories, Inc. Labeled windows cannot exceed 6 ft. in width nor 10 ft. in height; nor have more than 720 sq. in. of exposed glass area in each light. 1⅞-in. muntin bars and malleable iron locks are required to meet Underwriters' specifications.

VENTO STEEL SASH COMPANY

INCORPORATED

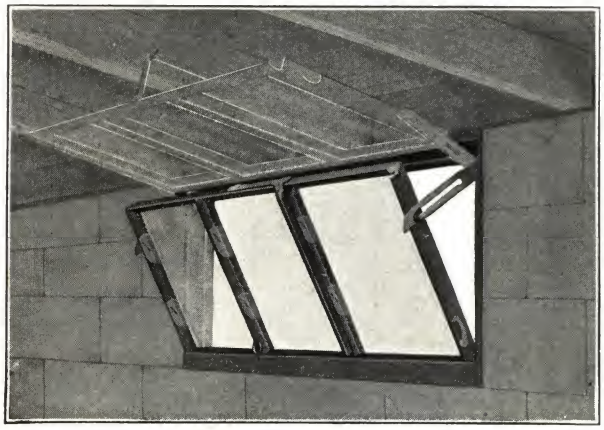
Puttyless Steel Windows and Metal Bound Screens

MUSKEGON, MICH.

Products

PUTTYLESS STEEL BASEMENT WINDOWS, PUTTYLESS STEEL FACTORY WINDOWS and Sash Operating Devices.

STEEL BOUND BASEMENT SCREENS and Factory Screens.



BASEMENT WINDOW STORM SASH.

Also Steel Thresholds and Pressed Steel Coal Chutes.

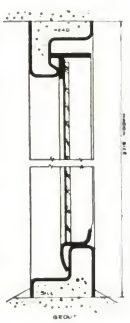
Windows Patented March 4, 1924, December 11, 1928, and July 30, 1929, United States Patent Office. Other patents pending.

Vento Puttyless Steel Basement Windows

We sincerely believe that an actual comparison of the new Vento "Premier" Basement Window with any other in the field will convince anyone that it is head and shoulders ahead

of its competition. Its double channel frame of copper bearing, special rolled steel is the strongest construction known—it cannot sag or bind. Sash is heavy section special T-bar stock welded in a rigid unit. This window provides both overhead ventilation and full opening *with a convenience probably unapproached by any other.* It is absolutely weathertight—supremely well made in every detail. Costs less installed than many others.

Outstanding Construction Features of Vento Basement Windows



Puttyless—The major cost of glazing is eliminated by the Vento patented puttyless feature. Glass is held in airtight contact against bed of cork by patented glazing clip. It takes less than a minute to install a pane of glass in a Vento Puttyless Sash.

Unlocked from Sill Level—The new Vento locking bar permits window to be opened or closed and locked from the bottom of the sash. When closed the lock bar lies snugly against the third cross-member, out of the way, and the window is tightly and securely locked—no need of a box, chair or what not to stand on.

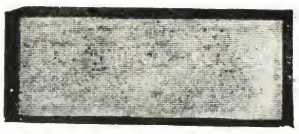
Operates without a Hitch—The "Premier" opens to top ventilating position at a touch of the locking bar. From this position it may be quickly opened wide by simply lifting sash over bottom rail and swinging upward where it may be held by means of ceiling hook fastened either in the ring provided at bottom of window or the locking bar. Snow or ice in no way interferes with the operation. Rain drains outside when window is left in ventilating position. Protective lock prevents intrusion when window is in this position.

All-around Double Contact—The double contact between the flanged sash and the window makes it absolutely weathertight—keeps out rain, wind, snow and sand. The easily operated friction lock keeps this double contact equal at all points.

Airtight Hinge Construction—The new Vento Sash construction eliminates the necessity of notching the sash. When closed the hinge fits neatly between sash and outer shoulder of the frame channel. It is 100% weathertight.

Fits Any Construction—The installation details shown indicate how easily and economically Vento Windows can be installed. They fit perfectly into any type of construction—concrete block, frame, brick or cement.

Mullions for Multiple Windows—Wherever a superabundance of light is desired, two or more Vento Basement Windows may be installed by use of our vertical mullions.



STANDARD SIZES VENTO BASEMENT WINDOWS

Size of window		Wall opening required		Net and shipping weight, lb.
Lights	Inches	Width, in.	Height, in.	
2	10x12	23 1/2	15	15
2	14x20	31 3/8	23	23
3	10x12	33 3/4	15	19

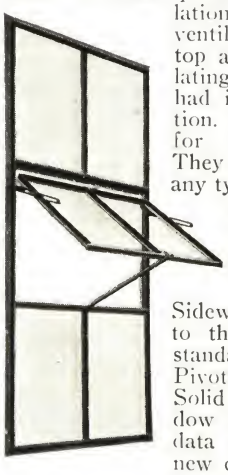
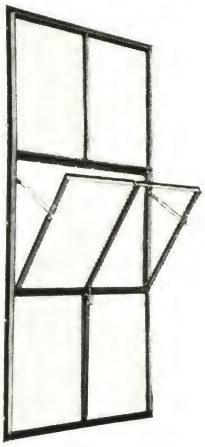
Vento Metal Bound Screens

Each Vento Basement Window is drilled and tapped ready to be fitted with a Vento 16-mesh Galvanized or Bronze Screen or Storm Sash.





Vento Basement Window Storm Sash

The panes in these sash are held by our patented puttyless glazing clips and hence may be quickly and easily replaced in summer by pane-size screens.

Vento Puttyless Sidewall Sash—Inward Projected

Vento Sidewall Sash incorporates the same time and money saving puttyless feature that is used in our basement sash. These windows provide overhead ventilation—indirect ventilation from bottom, or ventilation from both top and bottom. Ventilating sections can be had in any desired section. Frames are tapped for outside screening. They fit perfectly into any type of construction; are quality built in every detail, and usually cost less installed.

Sizes of Vento Sidewall Sash conform to those established as standard for Horizontal Pivoted Windows by the Solid Section Steel Window Industry. Complete data is contained in our new catalog.

Vento Puttyless Utility Sash

Ideal for home garages, small stores, etc. Made in 6-light 10x16-in. and 6-light 12x20-in. with upper section ventilating.

using
WEYERHAEUSER
4 SQUARE Guide Line FRAMING

4-SQUARE Guide-Line FRAMING

Weyerhaeuser 4-SQUARE Guide-Line FRAMING, the new precision lumber improved with eleven practical plus values, is manufactured in five American Lumber Standard dimensions—2x4, 2x6, 2x8, 2x10, 2x12—each size in standard lengths from 8 to 20 feet.

Other improved lumber products in the 4-SQUARE line, not shown here, come in labeled packages. They include Bevel Siding, Colonial Siding, Inch and Thick Finish, Inch and Thick Common, Drop Siding, Stepping, Flooring, Ceiling; and Mouldings in full length cartons.

WEYERHAEUSER SALES COMPANY

4-SQUARE Guide-Line FRAMING and Other Building Materials

LUMBER PRODUCTS INCLUDE WEYERHAEUSER 4-SQUARE LUMBER, WEYERHAEUSER STANDARD LUMBER, WEYERHAEUSER LABORATORY-DESIGNED AND CUT-TO-SIZE CRATING, WEYERHAEUSER POLES AND PILING. INSULATION PRODUCTS INCLUDE BALSAM-WOOL BLANKET, THE TRUE BUILDING INSULATION, AND NU-WOOD, THE ALL-WOOD INSULATING BOARD AND LATH

Weyerhaeuser 4-SQUARE Guide-Line FRAMING and 4-SQUARE Finishing Lumber are sold at retail by Authorized 4-SQUARE Lumber Dealers, from Coast to Coast

Precision Lumber

4-SQUARE Precision Lumber, and particularly 4-SQUARE Guide-Line FRAMING, is the first attempt to bring precision to lumber in the interests of good construction.

Compared with ordinary framing lumber, 4-SQUARE Guide-Line FRAMING is quite revolutionary in its economic scope. Produced on special machines from selected, seasoned stock, this new lumber has functional improvements which promote accuracy of construction and ease of use. It has been placed on the market at a surprisingly reasonable cost when its quality and inherent advantages are considered.

A Weyerhaeuser Product

4-SQUARE Lumber for Good Construction is made by Weyerhaeuser, the world's largest manufacturer of home building materials. The organization which has pioneered almost every important improvement in lumber manufacture, in scientific logging, in forest conservation and utilization. Owner and operator of 20 lumber mills, 4 central distributing plants, 923 miles of standard gage railroad, 4 steamships for lumber transportation to Eastern markets. This organization has been known for years in the profession as among the most progressive in fostering good design and good construction.

Outstanding Advantages

4-SQUARE Guide-Line FRAMING possesses *Eleven Plus Values,* practical advantages which make it a precision product, easier to use with greater assurance of permanent good construction.

1. Squared Ends—Both ends of every piece of 4-SQUARE Guide-Line FRAMING are machine-trimmed precisely square, automatically providing full bearing surfaces and snug, tight joints. Ordinary framing lumber is not squared on the ends and must be trimmed by hand on the job.

2. Exact Standard Lengths—Every piece is cut to precise standard length. A 14-foot joist, for example, is 14 full 12-inch feet in length. Ordinary framing lumber is seldom exact standard length. Frequently it is over-length, requiring hand-trimming. Too often it is scant.

3. Calibrated Every Inch with Guide Lines—A revolutionary innovation in lumber are these accurate guides pressed into the face of every piece of 4-SQUARE Framing. They serve as valuable time-saving, trouble-saving aids to precision in placing, measuring, fitting and leveling of framing members.

4. Seasoned Stock—The words, "Seasoned Stock," printed on every piece of 4-SQUARE Framing, are Weyerhaeuser's assurance that this precision lumber is ready and fit for immediate use in good construction. Ordinary framing lumber may or may not be seasoned. Too much of it is "green"—totally unfit for use in good construction.

5. Chamfered Edges—The instant you handle a piece of 4-SQUARE Framing you know it is unlike any lumber you ever handled before. All four edges of each piece are chamfered. No sharp edges. Easier to handle.

6. Better Appearance—Never before have you seen structural lumber that *looks* like the precision building material this improved Framing *is*. Properly surfaced on four sides after seasoning it is clean, bright, good-looking stock.

7. Marked for Species—The full species name, printed on each piece, is positive protection against substitution. Ordinary framing lumber is seldom species-marked.

8. Marked for Grade—The full grade name, printed on each piece, is positive proof that the quality specified and paid for is the quality delivered.

9. Trade-Marked—Every piece of 4-SQUARE Guide-Line FRAMING bears the nationally advertised Weyerhaeuser 4-SQUARE trade mark, for quick identification and protection to the buyer.

10. Sold Only by Authorized 4-SQUARE Dealers—The 4-SQUARE Franchise Sign is displayed only by selected lumber merchants who have proved their reliability and their knowledge of good lumber and its uses.

11. Guaranteed by Weyerhaeuser—All the specific precision advantages claimed for 4-SQUARE Guide-Line FRAMING are verified by the words, "Weyerhaeuser Guaranteed," printed on each piece.

An Architectural Product

Each piece of 4-SQUARE Guide-Line FRAMING is distinctly marked for identification as to "Species" and "Grade" and the fact that it is "Seasoned Stock" all backed by the guarantee and the trade mark of a responsible producer.

Thus, for the first time, the architect is in a position to specify definitely a lumber product with the full assurance that when 4-SQUARE Guide-Line FRAMING is named, the lumber delivered will fulfill in every respect his specification requirements.

Not only is the architect assured of the quality of the product specified, but the lumber has such definite elements of economy (apparent to anyone familiar with the use of ordinary lumber) that the architect is fully justified in its specific selection.

The Standard Specifications for House Framing

While many national organizations have in the past furnished standard details of wood framing, there has hitherto never existed a well organized, complete standard specification to supplement these accepted standard details.

For the convenience of the architect there is included in this manual such a specification. Its provisions are based on standard national good practice and may be regarded as containing all the elements needed to assure good sound construction based on the use of 4-SQUARE Guide-Line FRAMING.

STANDARD DETAILS FOR HOUSE FRAMING

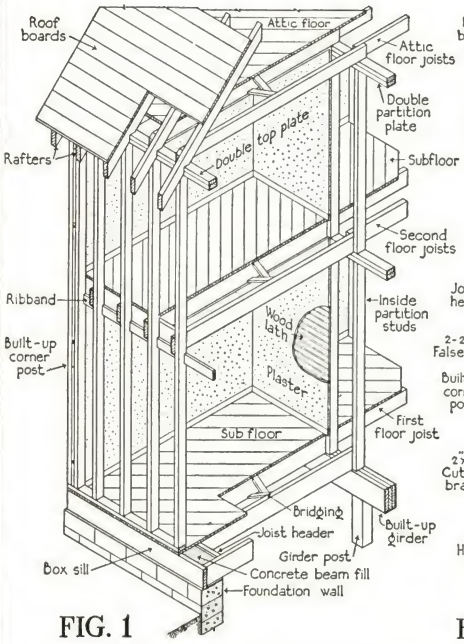

FIG. 1

THE BALLOON FRAME

This type of frame has many things to recommend it. The one piece studs, extending the full height of the wall and tied together by the ribband at the second floor line reduce to a minimum the shrinkage factor. It is strong and rigid but requires careful fire stopping.

This frame is more efficient when the interior studding is set directly on top of girders or bearing partitions.

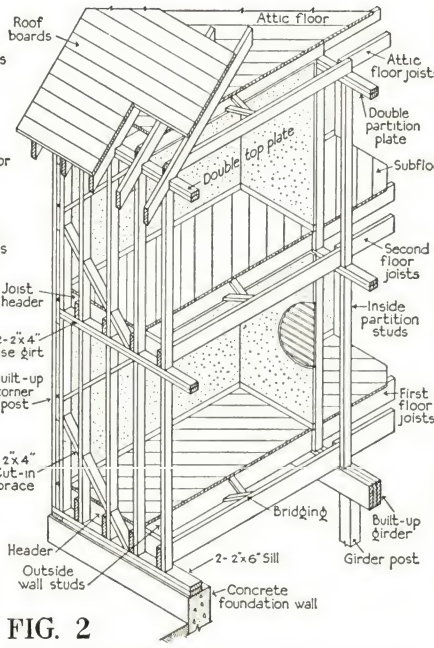

FIG. 2

THE MODERN BRACED FRAME

This type of frame is an outgrowth of New England solid timber post and girth construction. Built-up members are used today very largely and with equal satisfaction. Instead of heavy posts set eight or ten feet apart, walls are built with 2x4 in. studs set 16 in. on centers. The second floor is carried on a double 2x4 in girt. Diagonal bracing is inserted at the corners. This type has several commendable features. It is simple to build and has good provision for fire stopping both at sill and second floor line. 2x4 in. cut-in bracing, as illustrated, may also be used with other types.

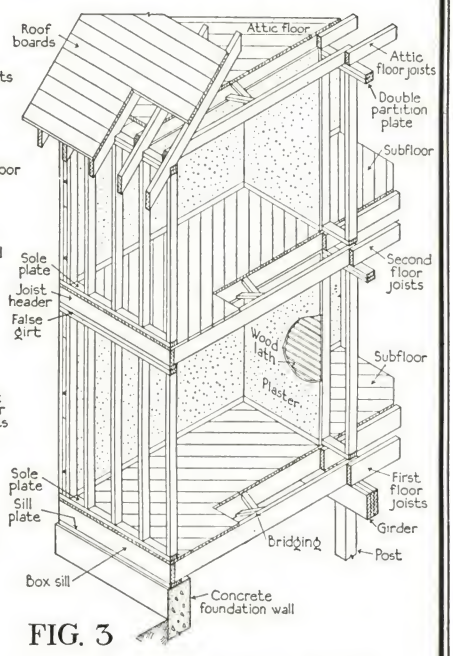

FIG. 3

THE PLATFORM FRAME

The Platform Frame is extensively used. It is similar in principle to Braced Frame but has boxed sill construction at each floor line. This makes for greater shrinkage but it is equalized on each floor when a similar type of construction is used under bearing partitions.

This frame is more efficient when the interior studding is set directly on top of girders or bearing partitions.

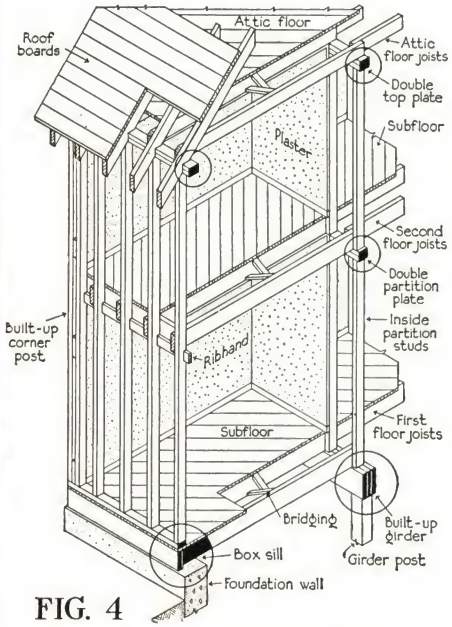

FIG. 4

DETAIL OF METHOD FOR SECURING BALANCED SHRINKAGE

THE FRAME provides the network to which the other materials are fastened and the strength and rigidity required to support the loads put upon it and preserve the materials with which it is built. Three distinct types of frames are shown by Figs. 1, 2 and 3. Numerous combinations of these types are frequently employed.

BALANCED SHRINKAGE

The total thickness of horizontal lumber in the framing of outside and inside walls on each floor should be equalized as nearly as possible to eliminate uneven shrinkage.

FIRE STOPPING

Fire safety in a dwelling is increased by preventing the circulation of air in the walls between floors or between rooms. An effective method is shown in the drawing to the right. (Fig 5)

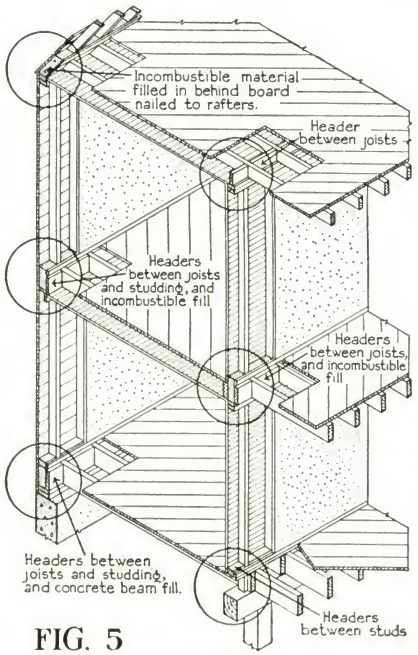

FIG. 5

FRAMING FOR FIRE STOPPING

MASTER SPECIFICATIONS

PREFACE

Scope

The scope of these specifications is confined to the erection of the rough structural frame above masonry footings and foundations, joists are covered with sub-flooring; and exterior walls are sheathed and the roofs boarded and the whole protected with waterproof building paper.

Window and door frames and exterior mill trim, siding, shingles, etc., are not included.

Details Required

Though customarily not furnished, certain of the illustrative drawings used in conjunction with this specification are obviously necessary and should be included among the details of the building if the full intent of the specifications is to be conscientiously carried out.

Specification Form

The form of this specification is that of a "Master" which includes all clauses which in ordinary practice apply to average work. All clauses, obviously do not apply to every building. In formulating the "Rough Framing and Carpentry Specifications" for a particular building, only those clauses which apply should be selected for inclusion. Special provisions or methods but seldom required are not included—such clauses should be added wherever necessary to define the procedure clearly and especially to obviate controversy involving responsibility and cost.

Notes

Notes in italics are explanatory or advisory only and should not be included in the specification.

Selective Words or Phrases

Wherever words or phrases occur in the body of the specification paragraph printed in italics and enclosed in parentheses, choose that word or phrase which applies to the particular work, omitting those that are irrelevant. Wherever the word "specify" occurs in italics enclosed in parentheses, thus *(specify)*, add the particular word or clause applicable, optional with the specification writer.

Local Ordinances

These specifications are based upon the recommendations of the National Committee on Wood Utilization, United States Department of Commerce; the National Lumber Manufacturer's Association and other national bodies. Engineering data are based upon the findings of the United States Department of Agriculture, Forest Products Laboratory.

Due to lack of universal adoption of nationally accepted standards, the specifications should be correlated with the requirements of Local Ordinances relating to this division of the work.

Alterations and Additions

These specifications cover new work only. For additions and alterations add such clauses covering repairs and replacements and the joining of old and new work as may be required.

Advisory Service

The technical staff of Weyerhaeuser Forest Products is at all times accessible for advice and recommendations in the formulating of the specification for "Rough Framing and Carpentry."

ROUGH FRAMING AND CARPENTRY

(1) General Conditions

The General Conditions governing the General Contract apply to the work under this division.

Note: *The American Institute of Architects' standard form of General Conditions is advocated.*

(2) Work Included

The work included under this heading is all of the rough structural wood framing as shown upon the drawings and details and herein specifically mentioned.

Note: *Amplify or amend as required for the particular work, and especially in the case of alterations and additions.*

(3) Preliminary Provisions

Note: *Provide for the following under other specification divisions when and where they apply.*

(3a) Footings, Foundations, Etc.—

(3a1) Footings—All footings shall be set well below the frostline and rest on firm soil. They shall be made of a good grade of concrete and be allowed to season thoroughly before starting the framework or masonry foundation.

(3a2) Bearing Surfaces—Bearing surfaces shall be flat and horizontal, and have an area equal to:

1 sq. ft. for every 4 tons of weight for coarse sand, gravel or hard clay.

1 sq. ft. for every 3 tons of weight for dry clay and fine sand.

1 sq. ft. for every 2 tons of weight for ordinary sand or clay.

1 sq. ft. for every 1 ton of weight for wet, soft clay or loam.

(3a3) Column Footings—Footings for columns shall be square and the base shall have a depth equal to one-half the length or width and the top shall set high enough to support the columns at least 3 in. above finished basement floor.

Note: *See Fig. 6, page 6.*

(3a4) Wall Footings—Footings for walls shall be at least 12 in. wider than thickness of foundation wall and at least 8 in. deep.

Note: *See Fig. 7, page 6.*

(3a5) Chimney Footings—Footings under chimneys shall be not less than 12 in. deep.

(3a6) Basement Stud Partition Footings—Provide concrete footings under all stud basement bearing partitions. Footings shall extend 3 in. above the basement floor forming a concrete base carefully troweled smooth which shall be at least the width of the finished partition. For non-bearing partitions form a similar base of concrete when the finished concrete floor is laid.

(3a7) Foundation Walls—Foundation walls shall be at least 12 in. thick. Materials for foundations shall be a good grade of concrete, approved concrete blocks, hard brick, hollow load bearing tile, stone masonry or other approved impervious material adapted to local soil conditions. The top of the foundation walls shall be leveled-up so as to furnish uniform bearing for framing.

(3a8) Drainage—Tile drainage, level with the footings shall be provided on up-hill side of walls and on all other sides where ground water is apt to collect.

(3b) Dampproofing—

Note: *Moisture is necessary for the growth of fungi, the most common cause of wood decay. Proper dampproofing at all points of juncture between masonry (usually prone to capillarity) and wood should obviously be provided.*

STANDARD DETAILS FOR HOUSE FRAMING

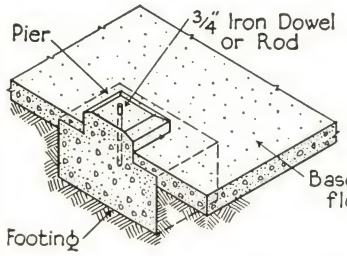

FIG. 6 FOOTING FOR COLUMN

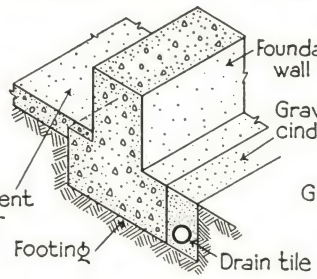

FIG. 7 FOOTING FOR FOUNDATION WALL

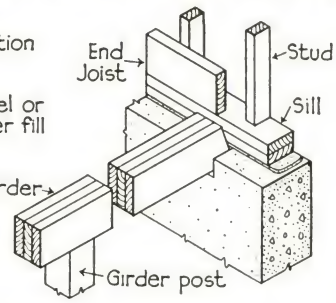

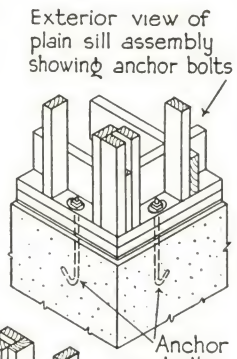

FIG. 8 BUILT-UP GIRDER—END SET IN CONCRETE WALL

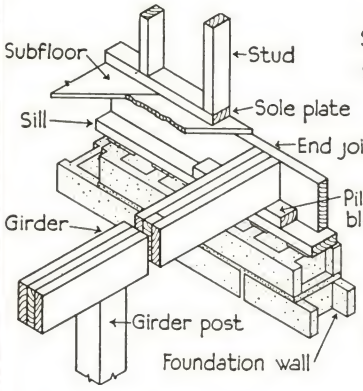

FIG. 9 BUILT-UP GIRDER END SET ON SILL PLATE

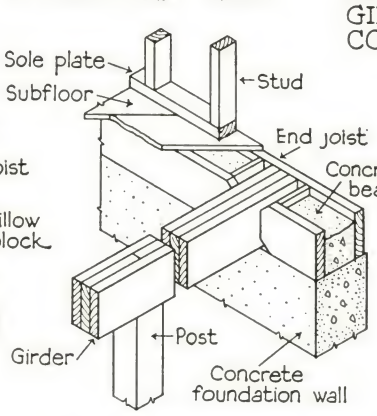

FIG. 10 BUILT-UP GIRDER END SET ON CONCRETE WALL

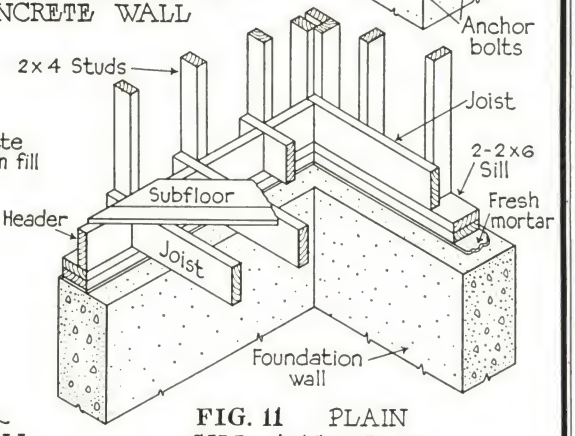

FIG. 11 PLAIN SILL ASSEMBLY

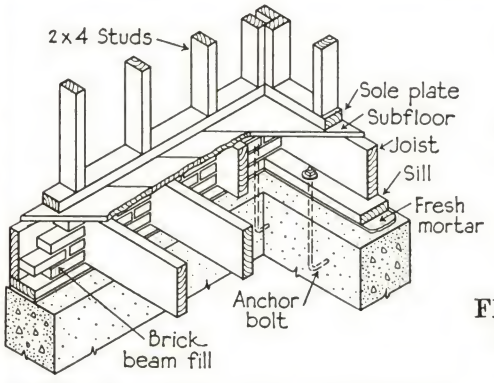

FIG. 12 BOX SILL ASSEMBLY WITH SILL PLATE

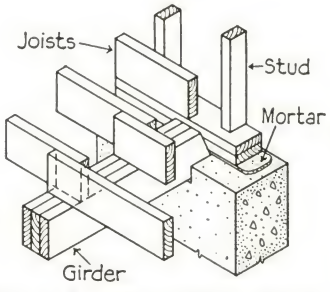

FIG. 14 FRAMING JOIST ON TOP OF GIRDER

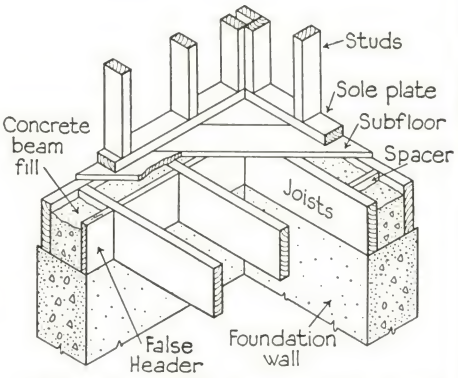

FIG. 13 BOX SILL ASSEMBLY WITHOUT SILL PLATE

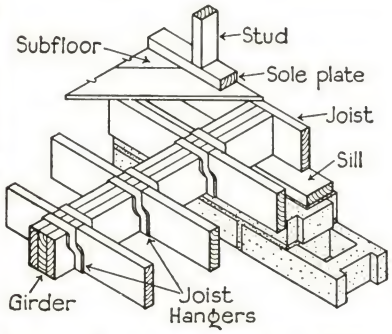

FIG. 15 FRAMING JOIST LEVEL WITH TOP OF GIRDER

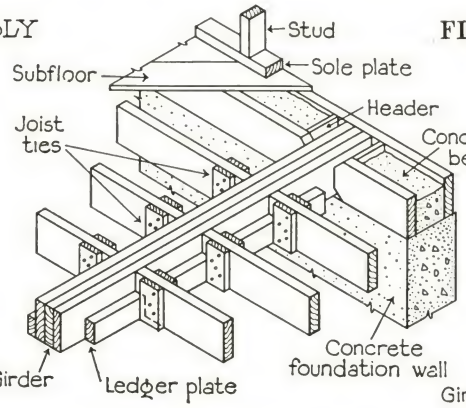

FIG. 16 FRAMING JOIST NOTCHED OVER LEDGER STRIP

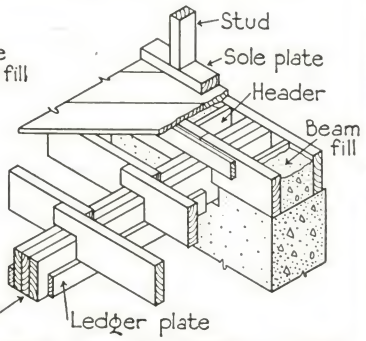

FIG 17 FRAMING JOIST NOTCHED OVER GIRDER

Provide integrally waterproofed mortar or concrete at all points of contact between masonry and wood or dampproof the masonry at these points with a coating of dampproof paint.

(3c) Dowels, Anchors, Etc.—

(3c1) Post or Column Dowels—Provide steel anchor dowels for all wood posts or columns, ¾ in. in diameter, set 12 in. in concrete footings and extending 2 in. into hole bored in bottom of columns. Accurately center dowels in footings.

Note: *See Fig. 6, page 6.*

(3c2) Sill Anchors—Furnish and install, accurately located (as detailed), ¾ in. diameter steel hook bolts to anchor all *(sills) (sill plates)* to masonry walls. Anchors shall be set from 16 in. to 20 in. in the masonry work and not more than 8 ft. apart between stud locations with one anchor on each side of all corners. They shall project a sufficient height above top of masonry to pass through the sill and take large nuts and washers.

Note: *See Figs. 11 and 12, page 6, for details.*

(3d) Lumber Treatment—

Note: *In localities subject to termite depredation or at points of construction exposed to fungi growth, the chemical treatment of lumber and particularly that coming in contact with masonry foundations may be necessary. Recommendations to suit the particular locality best may be obtained from the Weyerhaeuser Technical Staff.*

(4) Materials and Dimensions

(4a) General—Where so specified, all material for the structural wood frame shall be "4-SQUARE Guide-Line FRAMING" as marketed exclusively by Weyerhaeuser Sales Co., St. Paul, Minnesota, or equivalent, meeting fully the following specifications:

No. 1 common grade, seasoned stock; surfaced four sides to American Lumber Standard sizes; trimmed square and true at both ends to exact full lengths; fully identified and guaranteed as to grade, species and seasoning.

Note: *"4-SQUARE Guide-Line FRAMING" is made from No. 1 common grade, S4S. Therefore in the specifications under sub-headings "Grade and Species," only the one designation is necessary.*

Solid timber and other grades and sizes not specified to be "4-SQUARE Guide-Line FRAMING" shall be in accordance with the rules of the Association of Lumber Manufacturers covering the region in which it is produced.

(4b) Abbreviations—Wherever the following trade abbreviations occur, they shall be interpreted as follows:

S4S—Surfaced four (4) sides.

S1S1E—Surfaced one (1) side and one (1) edge.

(4c) Finished Dimensions—All sizes specified are nominal and shall be interpreted as the Standard Commercial Size established by the Lumber Association covering the region in which the lumber was produced.

Note: *See "Standard Sizes of Lumber," page 17.*

(4d) Wood Posts or Columns—

(4d1) Grade and Species—Solid timber, No. 1 Common Grade of Douglas Fir, S4S.

(4d2) Dimensions—Sizes marked on plans.

Note: *Posts should be preferably square, and in any case not smaller than 4x6 in. Provide full bearing for width of girder supported. Height should not be greater than 50 times its least dimension. Posts 6x6 in. or less over which girder is spliced or butt-jointed should be provided with ribbed cast iron caps. Posts supporting wood girders should not be spaced more than 10 ft. apart. See data for determining size of posts, page 17.*

(4e) Wood Girders—

Note: *Wood girders may be built-up or solid. While either type may be used, built-up girders are preferable because of greater strength, size for size; less shrinkage due to complete seasoning possible in thinner stock; and greater ease of installation. Members of built-up girder should be nailed together securely. See data for figuring girder sizes, page 17.*

(4e1) Grade and Species—

(a) Built-up Girders, "4-SQUARE Guide-Line FRAMING" Douglas Fir.

(b) Solid Girders, No. 1 Common Grade of Douglas Fir *(S4S) (S1S1E).*

(4e2) Dimensions—Sizes marked on plans.

(4f) Sills—

Note: *For types of sills, see Figs. 11, 12, and 13, page 6.*

(4f1) Grade and Species—"4-SQUARE Guide-Line FRAMING" Douglas Fir *(or No. 2 common Douglas Fir, S4S or S1S1E except for Box Sill).*

(4f2) Dimensions—

(a) Plate Sills, 2x6 in. under 2x4 in. studding; 2x8 in. under 2x6 in. studding as designated on plans.

(b) Box Sills, same dimensions as designated on plans for joists.

(4g) Joists—

(4g1) Grade and Species—"4-SQUARE Guide-Line FRAMING" *(Douglas Fir) (West Coast Hemlock).*

Note: *Select to suit local market conditions.*

(4g2) Dimensions and Spacing—Sizes and spacing marked on plans.

Note: *Joists should be spaced normally 16 in. o. c. except where additional strength is required for some particular floor area, in which case the joists should be doubled or extra joists set between the regular joists so as not to interfere with lathing. 12 in. o. c. spacing will also conform to lathing requirements.*

See data for determining size of joists, page 18.

(4h) Rafters—

(4h1) Grade and Species—"4-SQUARE Guide-Line FRAMING" *(Douglas Fir) (West Coast Hemlock).*

(4h2) Dimensions and Spacing—Sizes and spacing marked on plans.

All ridge, hip and valley rafters shall be at least 2 in. wider than the regular rafters. The ridge rafter may be of 1 in. material, but the hip and valley rafters shall be 2 in. thick.

Note: *Rafters should be spaced normally 16 in. o. c., since this permits setting the rafters directly over the wall studs and permits nailing each one to the side of the ceiling joist, thus tying the frame together and prevent spreading of the wall. Also, this spacing facilitates lathing in case underside of rafters is to be plastered. See data for determining size of rafters, page 19.*

(4i) Bridging—

(4i1) Grade and Species—Cut from sound boards of grade and species hereinafter specified for sheathing.

(4i2) Size—*(1x3 in.) (1x4 in.) (2x2 in.)* accurately beveled at ends to fit tightly against the face of joists.

(4j) Stair Strings or Carriages—

(4j1) Grade and Species—"4-SQUARE Guide-Line FRAMING" *(Douglas Fir) (West Coast Hemlock).*

(4j2) Dimensions—

Note: *Select to suit local market conditions.*

(a) Strings shall be 2 in. thick by such a width that when the rough riser and tread support is cut out the minimum dimension remaining shall not be less than *(3⅝ in.) (5⅝ in.) (specify).*

(b) Carriages shall be *(4x6 in.) (specify)* built up of 2 in. thicknesses.

(4k) Studs, Soles and Plates—

(4k1) Grade and Species—"4-SQUARE Guide-Line FRAMING" *(Douglas Fir) (West Coast Hemlock).*

Note: *Select to suit local market conditions.*

(4k2) Dimensions and Spacing—2x4 in. (other widths where so designated) studs spaced 16 in. o. c. (12 in. o. c. where so designated).

Note: *On exterior walls for one or two story houses the outside studs are customarily 2x4 in. In buildings over two stories and in cases of exceptionally high ceilings, studs should be 2x6 in. or larger.*

Basement bearing partitions should be framed with 2x4 in. studs and spaced 16 in. o. c. except where they support more than one floor, in which case they should be framed with 2x4 in. studs spaced 12 in. o. c. or 2x6 in. studs spaced 16 in. o. c.

All partitions above the basement should be framed with 2x4 in. studs spaced 16 in. o. c. (12 in. where so designated), except where thicker walls are required on the larger work for structural purposes or to conceal plumbing and heating pipes, vents, etc., or to provide for architectural effects.

(4l) Ribbands—

(4l1) Grade and Species—Same as hereinafter specified for "Wall Sheathing."

(4l2) Dimensions—*(1x4 in.) (1x6 in.)* S4S.

(4m) Diagonal Let-in Bracing—

(4m1) Grade and Species—Same as hereinafter specified for "Wall Sheathing."

(4m2) Dimensions—1x4 in. S4S.

(4n) Diagonal Cut-in Bracing—

(4n1) Grade and Species—Same as hereinbefore specified for "Studs, soles and plates."

(4n2) Dimensions—Same as exterior studding.

(4o) Sub-Flooring—

Note: *The grades, species, size, etc., of this type of lumber are numerous and must be selected to suit local stocks. Select from one of the following.*

(4o1) Grades and Species—

(a) No. 3 Common or better grade of *(Genuine White Pine) (Ponderosa Pine) (Spruce) (White Fir) (Fir and Larch) (Western Red Cedar)* in accordance with the grading rules of Northern Pine Manufacturers' Association, Western Pine Manufacturers' Association, California White and Sugar Pine Manufacturers' Association, or Western Pine Association as they apply.

Note: *Grade of No. 4 Common is permissible provided large and coarse defects that will weaken the boards materially are cut out.*

(b) No. 1 Common Grade of *(Douglas Fir) (West Coast Hemlock) (Western Red Cedar)* in accordance with the grading rules of West Coast Lumbermen's Association.

Note: *Grade of No. 2 Common is permissible provided large and coarse defects that will weaken the boards materially are cut out.*

(4o2) Dimensions—*(Square-edged) (Shiplapped) (Dressed and matched) (Dressed and matched and end matched)* 1 in. nominal thickness surfaced to $\frac{25}{32}$ in. or thicker and uniform width of *(4 in.) (6 in.) (8 in.) (10 in.) (12 in.).*

Note: *Square edged material may be used, although shiplapped or dressed and matched, is recommended due to its greater strength, warmth and soundproofness. Select to suit local market conditions. Stock dressed and matched and end matched is not recommended in widths exceeding 8 in.*

(4p) Wall Sheathing—

(4p1) Grade and Species—Same as specified hereinbefore for "Sub-flooring."

(4p2) Dimensions—*(Shiplapped) (Dressed and matched) (Dressed and matched and end matched)* 1 in. nominal thickness surfaced to $\frac{25}{32}$ in. or thicker and uniform width of *(4 in.) (6 in.) (8 in.) (10 in.) (12 in.).*

Note: *Select to suit local market conditions. Stock dressed and matched and end matched is not recommended in widths exceeding 8 in.*

(4q) Roof Boarding—

(4q1) Grades and Species—Same as specified herinbefore for "Sub-flooring.

(4q2) Dimensions—*(Square edged) (Shiplapped) (Dressed and matched) (Dressed and matched and end matched)* 1 in. nominal thickness surfaced to $\frac{25}{32}$ in. or thicker and uniform width of *(4 in.) (6 in.) (8 in.) (10 in.) (12 in.).*

Note: *Square edged material may be used, although shiplapped or dressed and matched is recommended due to its greater strength and warmth. Select to suit local market conditions. Stock dressed and matched and end matched is not recommended in widths exceeding 8 in.*

(4r) Miscellaneous Framing Items—

Note: *Here specify any miscellaneous framing items not customarily encountered but which are required on the particular work.*

(4s) Iron and Steel—

Note: *All anchors for sills, plates, etc., built into the masonry before the framing is erected should be included under the masonry specifications (see (3c), page 7). All anchors, plates, ties, stirrups, etc., attached to or a part of the framing should be included here.*

(4s1) Girder Plates—Provide *(where so detailed) (12x8x ½ in.) (specify size) (steel) (cast iron)* girder bearing plates.

(4s2) Post Plates—On posts 6x6 in. and under supporting spliced or butt jointed wood girders, provide full area cast iron post caps ¾ in. thick, with end clutch ribs and central rib parallel to girder to anchor ends of girders together at splice and maintain lateral contact. Provide 2 holes for spiking to girder top.

(4s3) Stirrups—*Furnish (¼x1½ in. steel stirrups to support all headers where specified and of finished width and depth equal to the joists. Top shall be provided with a turn-over hook to fit the top of trimmer width, punched for horizontal spiking to the trimmer side, and at bottom for spiking to bottom of header) (specify any other type).*

(4s4) Miscellaneous Items—

Note: *Here specify any miscellaneous items not customarily encountered but which are required on the particular work.*

(4t) Nails—Nails shall be *(Smooth) (Cement Coated) (common wire nails) (sinker nails) (non-splitting nails) (specify).*

Note: *Cement coated nails are recommended due to their greater holding power and the fact that in the same sizes as standard wire nails they are less in diameter and therefore less likely to split the wood. Since in the same size they weigh less than standard wire nails the comparative cost per pound is approximately the same. Non-splitting nails have also obvious advantages.*

(4u) Waterproof Building Paper—Waterproof building paper shall be *(specify brand)* as made by *(specify manufacturer).*

Note: *The building paper in frame construction not only protects the wood framing from moisture, but it prevents wind driven air infiltration and materially aids in fuel reduction. A high grade tough stock, permanently saturated with non-volatile waterproofing and preservative compounds is strongly advocated as an economy.*

(5) Wood Posts or Columns

Note: *See (4d), page 7. See details, page 6. For footings, see (3c1), page 7.*

(5a) Erect wood posts over dowel anchors with full level bearing on concrete footings. Posts shall be maintained plumb and true until supported girders and joists are secured in place.

(5b) Before erection, treat bottom of posts with hot creosote to protect against moisture *(and termites).*

Note: *This clause may be omitted if integrally waterproofed concrete is used in footings as suggested in (3b).*

(5c) On all posts 6x6 in. or smaller install *(cast iron) (specify)* caps securely attached to tops of posts.

Note: *See (4s2).*

(6) Girders

Note: *See (4e), page 7. See details, page 6.*

(6a) Construction of Built-up Girders—Tops and bottoms of built-up girders shall be sized where necessary to assure even bearing on supports and under joists.

A two-piece girder shall be nailed from both sides with 10 penny nails staggered and spaced 24 in. apart along both top and bottom edges. Near center of span space nails 12 in. apart.

A three-piece girder shall be nailed in same manner as above but using 20 penny nails.

A four or five-piece girder shall be assembled by nailing three members together in the same manner as above but using fewer nails and then nail the other members to this assembly.

(6b) All splices in girders shall be square cut and close fitted, centering over columns or piers.

(6c) Ends of girders bearing on masonry walls shall be cut with a 3 in. bevel.

Note: *Ends of all girders should have a bearing surface on solid concrete walls of not less than 4 in., on common brick (cement mortar) wall not less than 6 in. and when concrete block wall is used the girder should bear on wall 8 in. and be supported by a steel or cast-iron plate.*

(6d) Provide *(where so detailed) (2x4 in.) (specify)* joist ledger strips thoroughly secured to the girder with 16 penny nails staggered and spaced 12 in. apart along both top and bottom edges.

(6e) All girders shall be set with crown edge up, carefully leveled with full bearings at ends and intermediate supports.

(6f) Ends of girders setting on masonry shall have at least 1 in. clearance on sides and ends for free circulation of air.

(6g) Where so indicated girder ends shall be provided with *(steel) (cast iron)* bearing plates accurately leveled and set in a ½ in. bed of *(waterproofed)* Portland cement mortar. Allow mortar to set before erecting girder.

(6h) Accurately notch girders over stay-fins of posts provided with *(cast iron) (specify)* caps.

Note: *See (4s2), page 8.*

(7) Sills

Note: *See (4f), page 7. See details, page 6.*

(7a) All ends shall be square cut and closely fitted. Bore all sills accurately to take steel foundation anchors.

Note: *See (3c2), page 7.*

(7b) Double sill members shall be securely nailed together with 16 penny nails staggered and set 24 in. apart along both edges. Joints between halves and at corners shall be lapped and broken.

(7c) All sills shall be laid on a ½ in. bed of fresh (waterproofed) Portland cement mortar, tapped lightly so as to assure a uniform, level bearing surface for the joists. Allow mortar to set before anchor bolts are tightened.

(7d) Treat the sills with a paint or dip coat of hot asphalt before erection.

Note: *This clause may be omitted if tops of masonry walls are dampproofed or sills are laid over a bed of waterproofed mortar.*

(8) Joists

Note: *See (4g), page 7. See details, pages 6 and 10.*

(8a) General—

(8a1) All joists shall be set with crown edge up, carefully leveled with full bearings at ends and intermediate supports. All headers and starting joists shall be selected for straightness.

(8a2) All butted joints shall be square cut and closely fitted.

(8a3) Space joists uniformly 16 in. o. c. (12 in. o. c. where so shown). Where required for added strength of particular floor areas, as hereinafter indicated, doubled or extra joists shall set between the regular joists so as not to interrupt the uniform spacing required for standard lath units.

(8a4) Joists (including headers and trimmers) shall not be cut away to permit pipe installations, etc., unless adequate provision is made to compensate for the loss of strength.

(8b) Framing Around Floor Openings—

(8b1) Provide accurately fitted double header and trimmer joists of the same size as the regular joists around all floor openings. If the header is longer than six (6) feet and set back more than three (3) feet from the ends of trimmer, the trimmer shall be tripled, unless it is supported by a bearing partition column or girder.

Note: *See Fig. 22, page 10.*

(8b2) The ends of all headers longer than 3 ft. 6 in. (except when supported by columns or bearing partitions) shall be carried in steel stirrups, supported by and secured to the trimmer. Counter sink stirrups above and below the tops and bottoms of headers and trimmers.

Note: *See (4s3), page 8 and Fig. 22, page 10.*

(8b3) Wherever a trimmer is cut away at the header line, (as at an open stairway) the trimmer end shall be supported at the corner by a partition or post extending down to a girder or to a concrete footing. Where impossible to use a post, the construction shall be cantilevered and strongly braced.

Note: *See Fig. 30, page 14.*

(8b4) Trimmers and headers around chimneys and hearths shall be set at least two (2) inches from the face of the masonry. In no case shall a framing member be allowed to set in or on a chimney wall.

(8b5) Provide correctly turned wood centers with outer ends supported on header ledger strips and butts supported on brick chimney-breast corbels for the support of rough brick hearth-arches.

Note: *Omit (8b5) if reinforced concrete cantilever hearth slabs are provided.*

(8b6) In fabricating headers and trimmers, a single header joist shall first be nailed to the ends of all joists supported with 20 penny nails two (2) for 2x6 in., three (3) for 2x8 in., four (4) for 2x10 in. and 2x12 in. joists). The second member shall then be nailed to the first with 16 penny nails staggered and spaced 16 in. apart along both top and bottom edges. The trimmer joists shall be nailed in a similar manner and with the same size nails, first to the ends of header joists and then to each other.

(8c) Framing Under Partitions—

(8c1) Double the joists under non-bearing partitions running parallel with the joists for spans 10 ft. or less. When span exceeds 10 ft. or partition height exceeds 9 ft. 6 in., the supporting joists shall be tripled. Doubled joists shall be separated a distance equal to the width of the supported partition sole and bridged every 18 in. with solid blocks the full joist depth (cut from joists) set with the grain running horizontally.

Note: *See Fig. 26, page 12.*

Where joists are tripled, first fabricate doubled joists as above and then secure a third joist at one side with 16 penny nails staggered and spaced 16 in. apart along both top and bottom edges.

Note: *This provides solid nailing for the finished flooring and allows pipe space through to partition without cutting away the supports.*

(8c2) When one or more non-bearing partitions are set at right angles to the joists near the center of spans exceeding 10 ft., alternate joists shall be doubled.

(8c3) When bearing partitions are not directly supported on girders or bearing partitions, but are offset not to exceed 1/20 of the span of the supporting joists running at right angles to the partition, then alternate joists shall be doubled. If distance away from girder or bearing partition exceeds 1/20 of the span, all joists shall be doubled.

(8d) Framing for Tile and Similar Floors—

Note: *The joists under toilet, bathroom and similar floors should provide for an additional dead load of 30 lbs. per sq. ft. for tile floors. Provide for an additional 20 lbs. per sq. ft. for plumbing fixtures. This often requires that joist be set 12 in. o. c. or extra joists set between regular joists. See Fig. 23, page 10.*

(8d1) Where tile or similar floors are to be installed, the top edges of joists directly under these floors shall be tapered and 1x2 in. ledger plates nailed along each side to support the cut-in sub-floor.

(8d2) Joists shall be arranged, wherever possible, to permit installation of pipes with a minimum amount of cutting away of the joists. If this is not possible, headers and trimmers shall be provided to compensate for the loss of strength.

Note: *See Fig. 23, page 10.*

THIRD OR ATTIC FLOOR JOIST ASSEMBLY

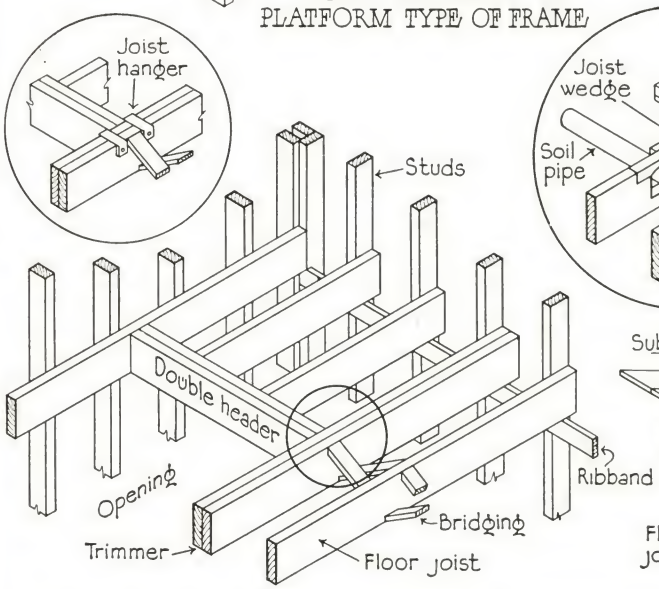

FIG. 22 FRAMING AROUND FLOOR OPENING

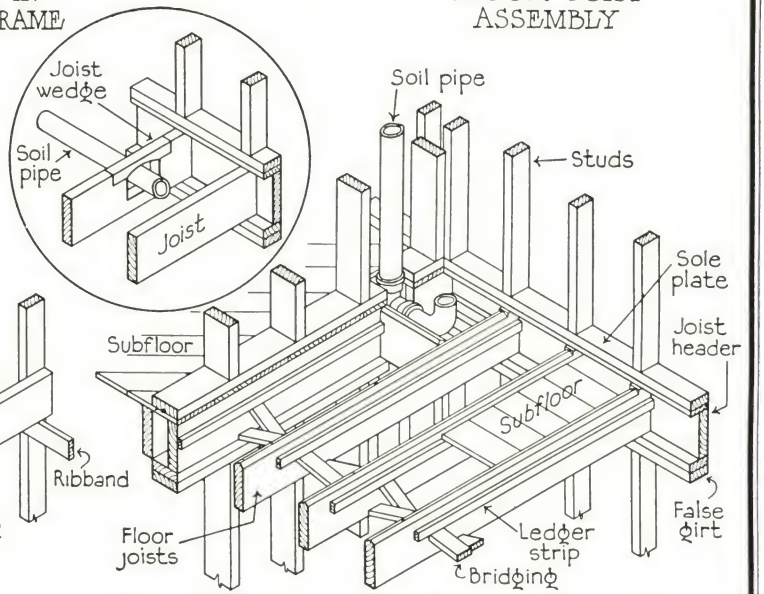

FIG. 23 FRAMING JOIST UNDER BATHROOM

(8e) Framing Joists to Girders—

Note: *Choose and include the clauses which apply to the particular construction detailed.*

(8e1) Joists Bearing on Top of Girder—

Note: *This method, illustrated by Fig. 14, page 6, is the most common, simplest and best when it is not necessary to conserve head room. It does not take away from the strength of joists. Can be used in connection with either the PLAIN SILL or BOX SILL (see Figs. 11, 12 and 13, page 6). The shrinkage factor can be reduced by framing bearing partition studs to rest directly on girder. (See Fig. 25, page 12).*

Joists shall lap each other at least six (6) inches uniformly over the girder and shall be nailed together securely where they lap, with two 10 penny nails driven from each side.

(8e2) Joists, Stirrup Hung, to Flush-top Girders—

Note: *This method, illustrated by Fig. 15, page 6, is recommended where it is necessary to conserve head room. Adapted for use in connection with PLAIN or BOX SILL (see Figs. 12 and 13, page 6).*

Ends of joists shall be square cut and tightly fitted against girder. Joists shall be sized to form even bearing surface over countersunk iron stirrup straps. Secure joists to stirrups with a 10 penny nail driven through bottom of stirrup.

(8e3) Joists Notched over top of Girders and Supported on Ledger—

Note: *This method, illustrated by Fig. 17, page 6, is suitable for more economical construction on small house work. Does not provide sufficient bearing surface for long joist spans. Reduces shrinkage factor to some extent.*

Notches in joist shall be cut evenly so as to secure level surface for sub-floor and with at least six (6) inch lap. Cut notches so that all load shall bear on ledger strip with ⅛ in. clearance over girder top. Joists shall be nailed together securely where they lap each other, using two 10 penny nails driven from each side.

(8e4) Joists Notched and Carried on a Ledger and Fitted Flush with Top of Girder—

Note: *This method, illustrated in Fig. 16, page 6, is not recommended. It is often met with in construction and may be used when properly reinforced at the weak point. While it provides increased head room and reduces shrinkage, the joists are apt to crack at the angle of the notch unless definite precautions are taken.*

Notches in joists shall be accurately cut to give full bearing on the ledger strip with the top joists set ¼ in. above the top of the girders. Sides and bottoms of joists shall be toe-nailed to girder and ledger. Securely nail a 1x4 in. cleat on each side of each joist close to the ledger.

(8f) Framing First Floor Joists at Outside Walls—

Note: *Provide for beam-filling in Masonry Specifications.*

(8f1) Plain Sill Construction—

Note: *This method of support, illustrated by Fig. 11, page 6, is adapted to the BRACED or BALLOON FRAME.*

All joists shall be toe-nailed to sill plate with three 10 penny nails and separated by spacers of the same size as the joist. Spacers shall be set back from ends of joist a distance equal to the width of studs and shall be fastened in place by two 16 penny nails driven into each end through the joists. Ends of joists shall be nailed to studs with three staggered 16 penny nails.

The starting joist shall set back from outside edges of sill plate a distance equal to the width of studs and shall be toe-nailed to the sill plate with 10 penny nails spaced 20 in. apart and to each stud with three 16 penny nails.

(8f2) Box Sill with Plate—

Note: *This method of support, illustrated by Fig. 12, page 6, is adapted to the BALLOON or PLATFORM FRAME.*

Both headers and starting joists shall be set flush with the outside of sill plate and shall be toe-nailed to it with 10 penny nails set 20 in. apart.

All joists shall be toe-nailed, each side, to sill plates with one 10 penny nail.

(8f3) Box Sill without Sill Plate—

Note: *This method of support, illustrated by Fig. 13, page 6, is used with BALLOON or PLATFORM FRAME.*

Both headers and starting joists shall be set flush with the outside of studding above.

The headers shall lap the ends of the starting joists at all corners and shall be nailed to them with three 16 penny nails for 2x8 in. joists, and four 16 penny nails for 2x10 in. and 2x12 in. joists.

All joists shall be set 16 in. o. c. (12 in. o. c. where so indicated) measured along top edge of headers. Headers shall be nailed to the joist ends with the same number and size of nails as specified above.

All joists shall set flush with top of main headers.

(a) Provide joist-size false headers along the sides and false joists across the ends set flush with inside face of foundation wall, toe-nailed in place. Along the ends, provide solid spacers the full joist depth set four feet apart o. c.

This assembly shall be leveled-up and "beam-filling" (installed by others) shall be tamped under all members that do not have full bearing on foundation walls. "Beam-filling" shall be added sufficient to fill all boxes flush with top of joists. Allow fill to set, before putting on the sub-floor.

Note: *Omit this clause (a) if brick beam-filling is used as in (b). Provide for furnishing and installing of beam-filling in Masonry Specifications for 1-3-6 concrete mixture with a limited amount of water to prevent as far as possible the swelling of joists and subsequent shrinkage. Brick beam-filling is often preferred since less moisture is contained in the mortar necessary to lay the dry brick. See Fig. 13, page 6.*

(b) This assembly shall be leveled-up and the bed of mortar for brick beam-filling (installed by others) shall be thoroughly tamped under all members that do not have full bearing on foundation walls. Brick beam-filling shall be added using as little mortar as possible to fill from the top of wall flush with tops of joists and inner face of wall. Allow fill to set before putting on sub-floor.

Note: *Omit this clause (b) if concrete beam-filling is used as in (a) above. See note above. See Fig. 12, page 6.*

(8g) Framing Second Floor Joists—

(8g1) Balloon Frame Construction—

Note: *This method is illustrated by Fig. 18, Page 10.*

The ribbands shall be let into studs their full thickness. Ribbands shall be selected for straightness and leveled-up so as to support all joists evenly, and shall be nailed to each stud with two 8 penny nails.

The joists shall be placed against sides of studs and nailed to them with three 16 penny nails. The starting joists shall be nailed to each end wall stud with two 16 penny nails.

The inside ends of all joists shall be supported on partitions having a double 2x4 in. plate with the studs in this partition set as nearly under each joist as is possible. Joists shall lap each other directly over bearing partitions for a distance equal to the width of the partition plate and shall be nailed together with two 10 penny nails driven from each side. All joists shall be toe-nailed, each side of laps, to the bearing partition plates with one 10 penny nail.

(8g2) Braced Frame Construction—

Note: *This method is illustrated by Fig. 19, page 10.*

The joists shall be placed 16 in. o. c. (12 in. o. c. where studding is 12 in. o. c.) measured along the false girt and shall be toe-nailed to it with two 10 penny nails on each side.

The joists shall be placed against sides of studs and nailed to them with three 16 penny nails. The starting joists shall be nailed to each end wall stud with two 16 penny nails.

STANDARD DETAILS FOR HOUSE FRAMING

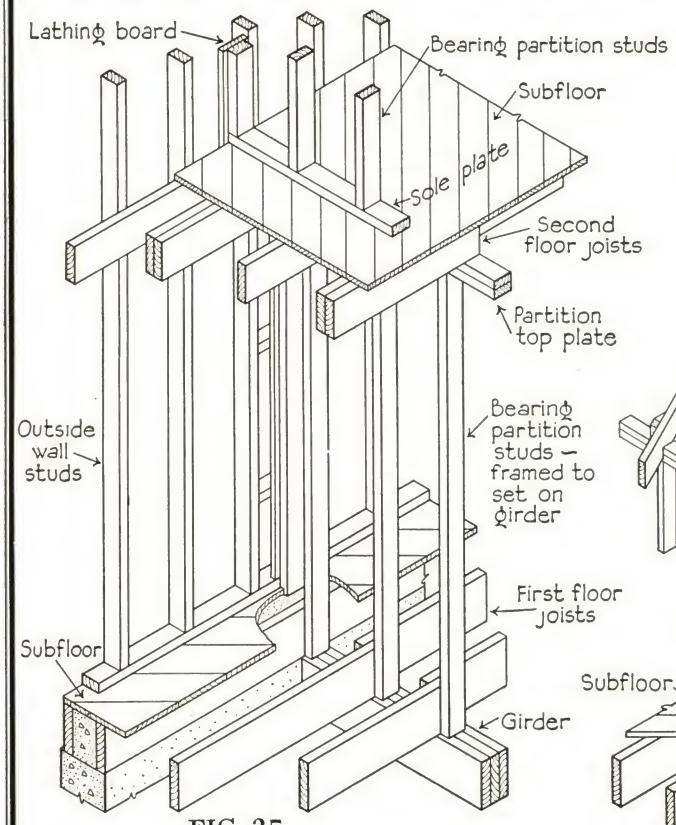

FIG. 25
FRAMING FOR BEARING PARTITION

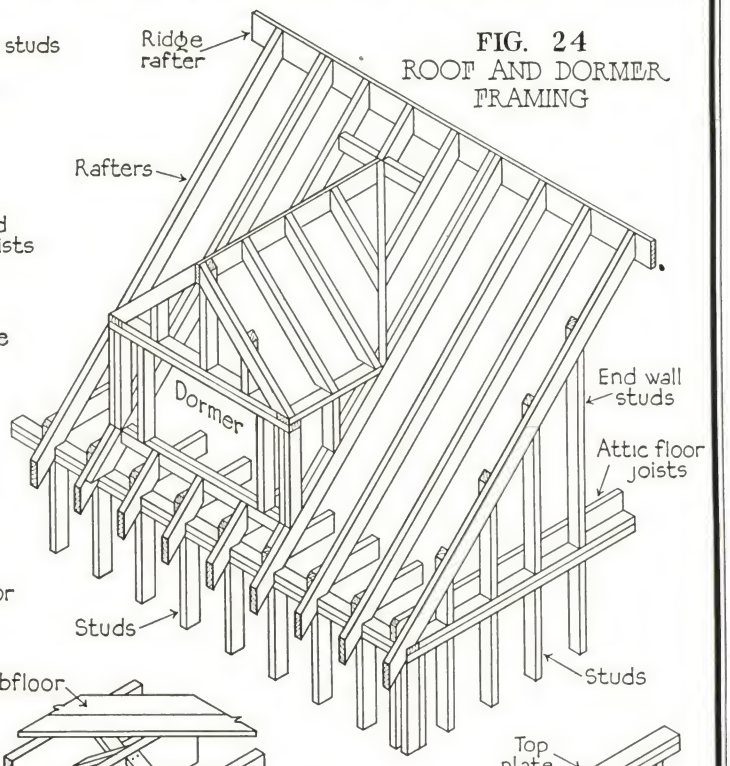

FIG. 24
ROOF AND DORMER FRAMING

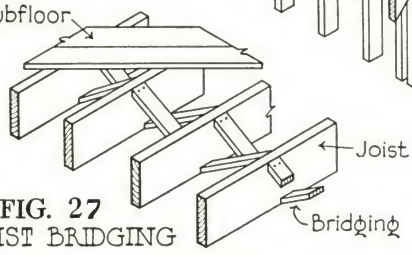

FIG. 27
JOIST BRIDGING

Note: Bridging should be nailed at top only until after subflooring is laid.

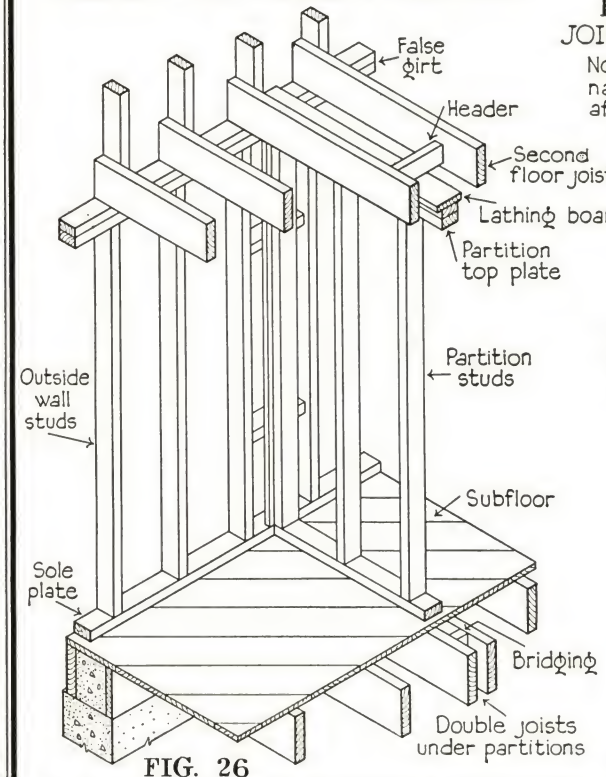

FIG. 26
FRAMING FOR NON-BEARING PARTITION

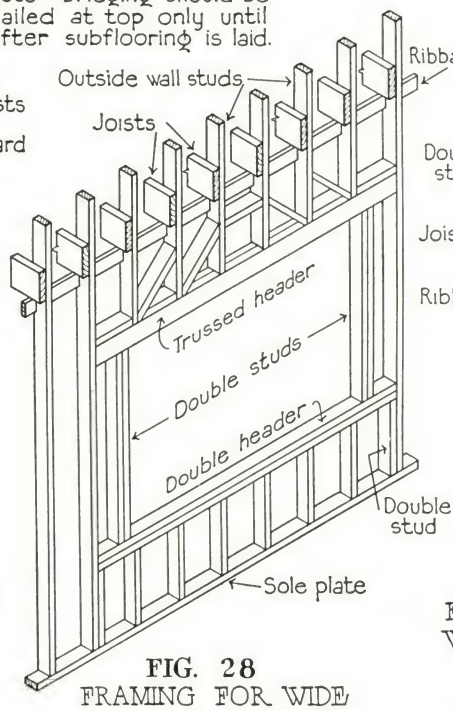

FIG. 28
FRAMING FOR WIDE WINDOW OPENINGS

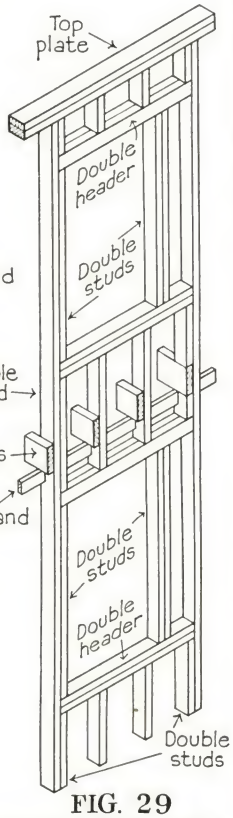

FIG. 29
FRAMING FOR TWO WINDOW OPENINGS — ONE ABOVE THE OTHER IN BEARING WALL

The inside ends of all joists shall be supported on partitions having a double 2x4 in. plate with the studs in this partition set as nearly under each joist as is possible. Joists shall lap each other directly over bearing partitions for a distance equal to the width of the partition plate and shall be nailed together with two 10 penny nails driven from each side. All joists shall be toe-nailed, each side of laps, to the bearing partition plates with one 10 penny nail.

(8g3) Platform Frame Construction—

Note: *This method is illustrated by Fig. 20, page 10.*

Both headers and starting joists shall be set flush with the outside edge of false girt and shall be toe-nailed to it with 10 penny nails set 20 in. apart.

All joists shall be toe-nailed, each side, to false girt with one 10 penny nail.

Headers shall be nailed to the joist ends with three 16 penny nails for 2x8 in. joists, and four 16 penny nails for 2x10 in. and 2x12 in. joists.

The inside ends of all joists shall be supported on partitions having a double 2x4 in. plate with the studs in this partition set as nearly under each joist as is possible. Joists shall lap each other directly over bearing partitions for a distance equal to the width of the partition plate and shall be nailed together with two 10 penny nails driven from each side. All joists shall be toe-nailed, each side of laps, to the bearing partition plates with one 10 penny nail.

(8h) Framing Third or Attic Floor Joists—

Note: *The method illustrated by Fig. 21, page 10, for supporting outer ends of the third or attic floor joist is adapted to either the BRACED, BALLOON or PLATFORM types of frame.*

(8h1) Joists shall be spaced 16 in. o. c. (12 in. o. c. where so indicated) measured along the plate and toe-nailed to it with two 10 penny nails on each side.

Ends of all joists shall set flush with outside edge of plate and top corners shall be chamfered (when necessary) after rafters have been nailed in place.

(8h2) The joists shall be placed against sides of rafters and nailed to them with three 16 penny nails. The starting joists shall be nailed to each end wall stud with two 16 penny nails.

The inside ends of all joists shall be supported on partitions having a double 2x4 in. plate with the studs in this partition set as nearly under each joist as is possible. Joists shall lap each other directly over bearing partitions for a distance equal to the width of the partition plate and shall be nailed together with two 10 penny nails driven from each side. All joists shall be toe-nailed, each side of laps, to the bearing partition plates with one 10 penny nail.

(8i) Bridging—

Note: *See (4i), page 7. See Fig. 27, page 12.*

(8i1) Cross bridge all floor joists with one (1) row of bridging for spans from six (6) ft. to ten (10) ft.; two (2) rows for all spans from ten (10) ft. to twenty (20) ft.

Bridging shall divide the spans into equal parts and shall be nailed at both ends with two 8 penny nails driven at right angles to face of joists. All nails shall be started before members are set in place. Bridging shall be put in and the top ends nailed before laying the sub-floor. The bottom ends shall be nailed after the sub-floors have been laid.

Bridging shall be put in between the first three or four joists opposite the ends of headers when these headers are set two (2) ft. or more away from the end of the trimmer or from the regular row of bridging.

Note: *See Fig. 22, page 10.*

(8i2) Add a 1x4 in. continuous strip nailed to the underside of the joists (when not plastered) beneath each line of diagonal bridging.

Note: *On first story floors carrying heavy or concentrated loads this provision adds considerably to the strength in assisting in distributing the load over several joists.*

(8j) Miscellaneous.

Note: *Here include any special structural features not ordinarily encountered, but necessary in the particular work.*

(9) Studding (Outside Walls)

Note: *See (4k), page 7.*

(9a) General—

(9a1) Studs shall be spaced 16 in. o. c. (12 in. o. c. where so designated).

(9a2) All corners shall be made of three (3) studs so set as to provide approximately a full stud thickness on each side of the internal angle and all thoroughly blocked and secured together with 16 penny nails spaced 12 in. apart o. c.

Note: *See Figs. 18, 19 and 20, page 10 and Fig. 31, page 14.*

(9a3) Over the rough flooring, with outer edge flush with joist construction, lay a single 2x4 in. (2x6 in. for 2x6 in. studs) sole, secured through flooring to each joist with two 16 penny nails.

Note: *Include (9a3) for BALLOON with box sill and PLATFORM Frame Construction. See Figs. 1 and 3, page 4.*

(9a4) All studs shall be one piece (not spliced) from sill to plate *(or girt)* except at openings, in which case they shall be framed as specified for these openings.

All studs around openings and at corners shall be selected for straightness.

All studs shall have full bearing on sills or other bearing surfaces and shall be toe-nailed with four 8 penny nails (two on each side), except where these studs set against joists in which case secure with two nails on the one side.

Where studs set against joists, they shall be nailed to the joist with 16 penny nails, two for 2x6 in. and three for 2x8 in. joists and four for 2x10 in. or 2x12 in. joists.

All main studs shall be square cut and of uniform length so as to furnish uniform bearing for wall plates.

Studding at chimney shall be set at least *(one (1) inch) (specify)* from the face of the masonry.

Plates shall consist of two pieces of the same size material as the studs. They shall be lapped at the corners and at all joints. All joints shall be made directly over the studs.

Plates shall be nailed to top ends of each stud, one thickness at a time, with two 16 penny nails and to each other with 10 penny nails staggered and spaced 16 in. along each edge.

(9a5) All *(gable) (and) (dormer)* studs shall be notched and beveled to receive end rafters and rafters nailed to each stud with two 10 penny nails.

Note: *See Fig. 24, page 12.*

(9b) Framing Around Openings—

Note: *See Figs. 28 and 29, page 12, and Figs. 31 and 33, page 14.*

Double studs and headers shall be used around all openings (where 2x6 in. studs are used, the headers shall be tripled). All header members shall be securely nailed together, those at opening heads set on edge and secured flush with the outside face of studding.

For openings three (3) ft. wide or less in bearing walls and four (4) ft. wide or less in non-bearing walls, the material used for headers shall be the same size as studs. For wider openings up to five (5) ft. in bearing walls and seven (7) ft. in non-bearing walls, the material used for headers shall be of same thickness, but at least 2 in. wider than the studs. For wider openings the headers shall be symmetrically trussed.

STANDARD DETAILS FOR HOUSE FRAMING

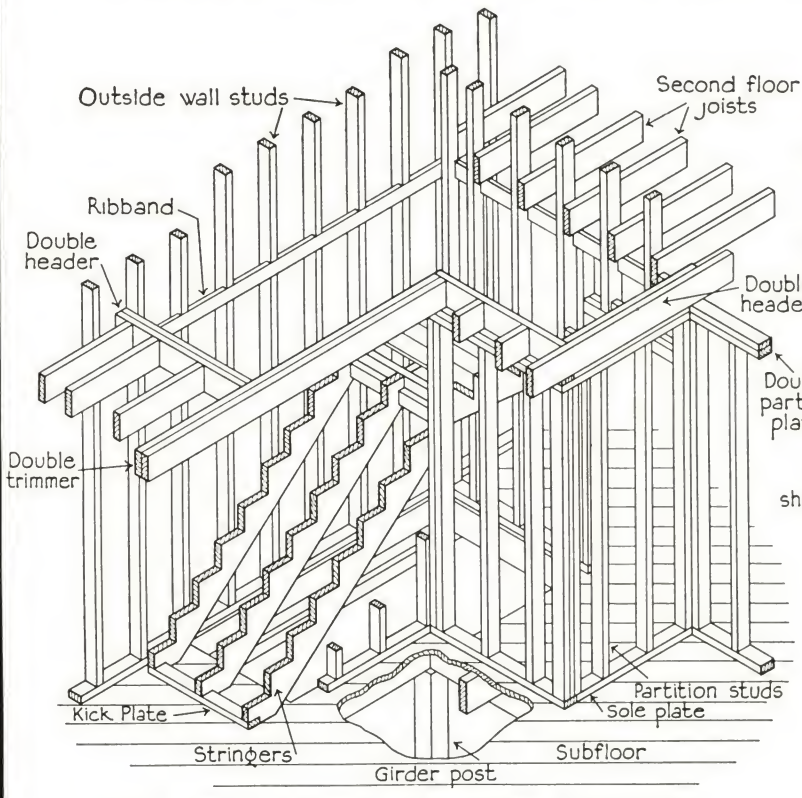

FIG. 30 FRAMING FOR OPEN STAIRWAY

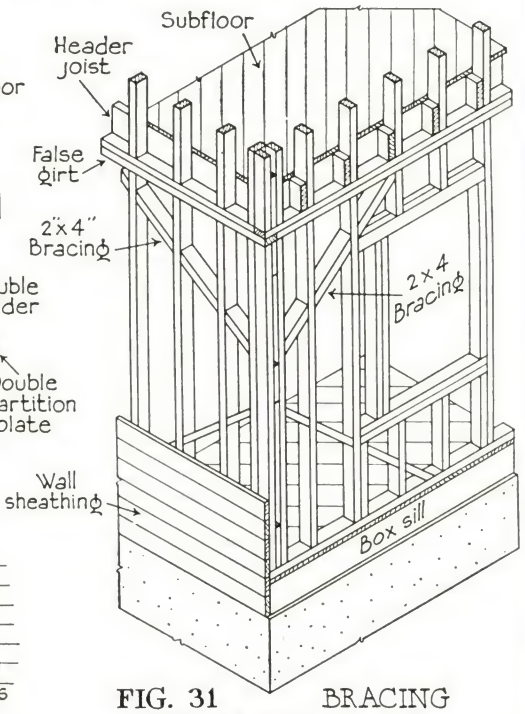

FIG. 31 BRACING
2"x4" Cut between studs
Sheathing applied horizontally

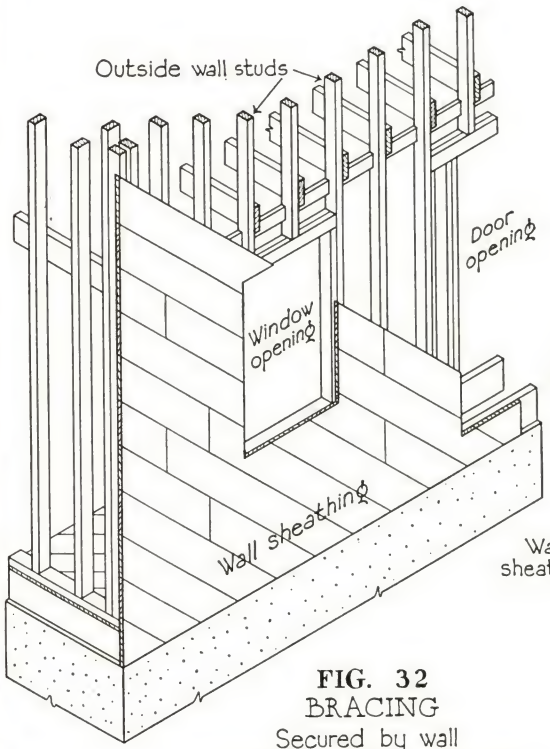

FIG. 32
BRACING
Secured by wall
sheathing applied diagonally

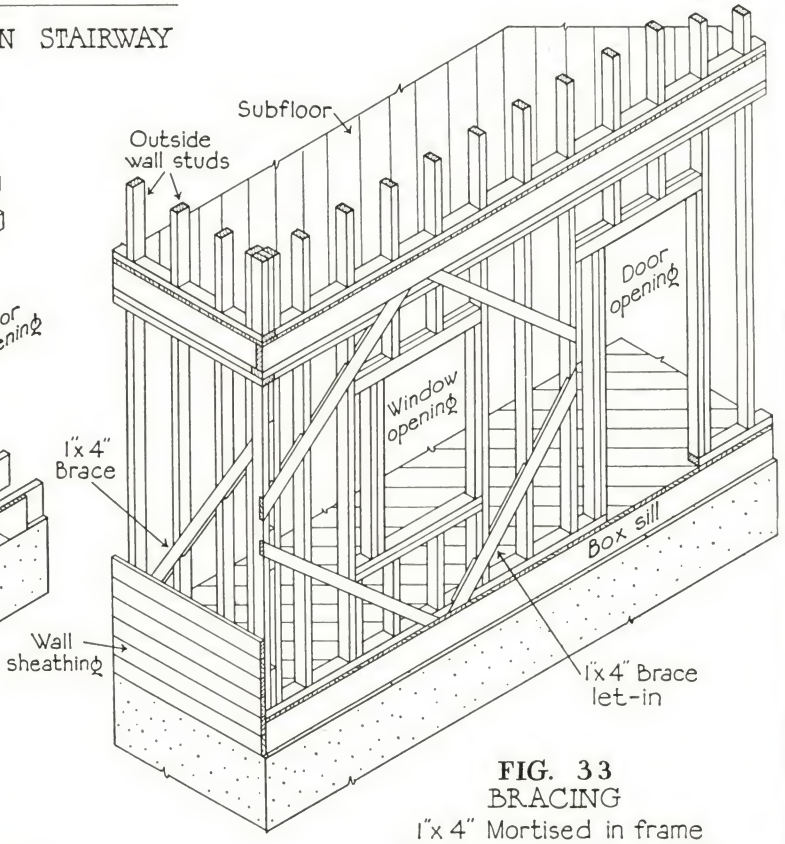

FIG. 33
BRACING
1"x4" Mortised in frame
Sheathing applied horizontally

In bearing walls the ends of the bottom headers in all window openings shall be supported by short studs nailed to the regular studs and extending down to the sill or second floor joists. Where a window opening in second floor comes above a first floor opening, studs at both sides of the openings shall be reinforced all the way up to the roof plate by short studs cut-in between all headers and nailed to them.

Double studs and bottom header members shall be nailed together with 16 penny nails staggered and spaced 16 in. apart along both edges. 2x4 in. headers shall be fastened to studs with two 16 penny nails driven through the studs into each end. The ends of all short studs fitted between the headers shall be toe-nailed to the headers with four 8 penny nails.

At windows, allow the dimensions detailed between finished jambs, sills and heads to rough framing for weight boxes, casement jambs, head jambs, etc.

Over the figured door sizes, allow *(3 in.) (specify)* in width *and (2½ in.) (specify)* in height for rough framing.

(9c) Bracing—

Note: *Bracing is essential in all frame construction, because it provides rigidity, resistance to wind pressure and assists to prevent plaster cracks. The three methods following are given in the order of effectiveness. Specify one.*

(9c1) Apply the sheathing diagonally.

Note: *See Fig. 32, page 14. Also par. (16a), page 16.*

(9c2) Provide let-in diagonal bracing at each story at all corners, set approximately at 45°, with upper ends on opposite side of corner studs and approximately full story height. Bracing shall be 1x4 in. accurately let-in the full thickness, flush with the outside face of studs and nailed to each stud with two 8 penny nails. Thoroughly brace at corners with two braces running in opposite direction where openings close to corners interfere with standard bracing.

Note: *Use where horizontal sheathing is specified. See Fig. 33, page 14.*

(9c3) Provide cut-in diagonal bracing at each story at all corners set at 45° with the upper ends on adjacent sides of corner studs and carried the full story height when possible. Braces shall be the same dimensions as the studding, accurately cut, tightly fitted between studding and in line. Nail bracing at each stud with two 10 penny nails. Where openings interfere with continuous bracing apply in shorter lengths at floor and ceiling of each story.

Note: *Use where horizontal sheathing is specified. See Fig. 31, page 14.*

(10) Studding (Partitions)

Note: *See (4k), page 7.*

(10a) General—All material shall fit squarely and tightly against all bearing surfaces and shall be nailed as specified for outside wall studs.

Wherever possible, bearing partitions shall set directly over girders or other bearing partitions and the studs in these partitions shall be framed to rest directly on the girders or bearing wall plates *(except that when the platform type of frame is used, then the second story partition studs shall set on a single sole of the same size material as the stud nailed to the sub-floor).*

Note: *See Fig. 25, page 12, and Fig. 19, page 10. Omit bracketed clause in italics if PLATFORM type of construction is not used.*

All non-bearing partition studs shall be set on a single plate nailed to the sub-floor except where a double plate permits use of standard length materials.

All bearing partitions shall be capped with a double plate and all non-bearing partitions with a single plate except where a double plate permits the use of standard length materials.

All studs, except those around closets or in other very short partitions, shall be set with edges parallel with the partition line.

Studding at chimneys shall be set at least *(one (1) inch) (specify)* from the face of the masonry.

(10b) Studding at Stair Wells—Carry all studding for stair wells continuously from First Story to Top Story ceiling. Let in a ribband to support joists at floors and construct as specified for Balloon Outside Wall Construction.

Note: *This prevents the bulging and cracking of plaster, usually encountered in open stair wells at the second and third floor levels due to shrinkage of floor joists, plates, etc.*

(10c) Framing Around Openings—Framing around all openings shall be as specified for studding in outside walls.

Allow *(3 in.) (specify)* in width and *(2½ in.) (specify)* in height over the figured door size for rough framing.

(10d) Sliding Door Partitions—Notch the studs on the inside 1 in. and set in a spreader of size detailed and located to take the door tracks and hangers specified. Furnish 2 in. thick plank to terminate the vertical end of pocket, allowing at least 2 in. clearance at back of door. Line pockets, both sides with *(⅞ in. ceiling) (specify).* Erect in accordance with the manufacturer's details and printed directions, the specified tracks, hangers, etc.

(10e) Miscellaneous—

Note: *Here include any special items, such as special partition construction for accordion partitions, etc.*

(11) Fire Stopping

Note: *The function of fire stopping is to increase fire safety by stopping the circulation of air and fire within the walls, partitions and floors. See Fig. 5, page 4.*

Fire stopping shall be provided at each floor level, both in the outside walls and bearing partitions by placing tightly fitted headers between the ends of the joists at these points. The boxes formed by these headers shall be filled with incombustible materials *(crushed mortar) (gypsum) (mineral wool) (specify),* so as to shut off more effectively the circulation of air.

(12) Construction to Balance Shrinkage

Note: *Lengthwise shrinkage of timber is practically negligible, but all lumber tends to shrink and swell across the grain with changes in atmospheric conditions. It is advisable from this standpoint to limit horizontal members as much as possible but, as it cannot be avoided entirely, it is necessary to balance the thickness or depth of the horizontal lumber in exterior and interior bearing walls. See Fig. 4, page 4.*

(12a) The thickness of horizontal framing members in exterior and interior walls shall be balanced on each floor level as nearly as possible.

(13) Rafters

Note: *See (4h), page 7.*

(13a) Flat Roofs—All low-pitch flat roofs, decks, etc., shall be constructed and bridged in exact accordance with the specification for floor joists.

(13b) Sloped Roofs—

(13b1) All rafters shall be notched or beveled so as to secure a bearing of not less than 3 in. on the wall plate and shall be toe-nailed securely to the plate with two 10 penny nails on each side. If set against the attic joists, they shall be nailed to the joists with two 16 penny nails in addition to the plate nailing.

Note: *See Fig. 21, page 10, and Fig. 24, page 12.*

(13b2) All rafters shall be cut and beveled so as to fit tightly against all *(ridge) (hip) (and) (valley)* rafters and shall be nailed securely to them with four 8 penny nails.

(13b3) *(Except on hipped roofs)* collar ties of same size material as the regular rafters shall be nailed to each pair of rafters as near half way up from the plate as is possible.

(13b4) Where due to lack of headroom, collar ties must be omitted, nail 1x4 in. or 1x6 in. ties to the underside of rafters on both slopes extending from the center of the ridge diagonally to the corners of the building.

Note: *A portion only of the strengthening effect of collar ties is obtained by this method.*

(13b5) Where heavy wind or snow loads are prevalent and when attic is not used for living quarters, the roof shall be strengthened with braces set at an angle to the rafters and about four feet apart extending from top of partitions preferably up to rafters near center of span. Braces shall be notched over a 2x4 in. member set on edge extending the full length of the roof section and nailed against the under side of the rafters.

(13c) Framing Around Openings—Rafters shall be doubled on each side of *(dormers) (chimneys) (scuttles) (skylights) (specify)* etc. and double headers shall be used around all openings where one or more of the regular rafters have been cut away.

All headers and double trimmers shall be nailed together with 16 penny nails staggered and spaced 20 in. apart along both edges.

Note: *See Fig. 24, page 12.*

(13d) Miscellaneous—

Note: *Here include any special structural features not ordinarily encountered, but necessary in the particular work.*

(14) Stair Construction

Note: *See (4j), page 7.*

(14a) General—*(Strings) (carriages)* shall be adequately supported at floors and landings. At all floors provide a 2x4 in. kick-plate at right angles to the stair run to take the thrust of the *(strings) (carriages)*. Notch the *(strings) (carriages)* over kick-plates at floors and ledger strips or trimmers at landings and receiving floors and securely toe-nail each to these supports.

Note: *See Fig. 30, page 14.*

(14b) Landings—Landings shall be framed with double trimmers and in all respects as specified for joists. Securely support landings on walls or partitions and brace and bridge against thrust. At the upper ends of stair runs provide a 1x2 in. ledger strip to receive stair strings or carriages.

(14c) Strings—Cut solid strings accurately to the pitch, rise and run of risers and treads. Provide *(3) (specify)* strings to each run.

Note: *Omit (14c) if carriages are used.*

(14d) Carriages—Carriages, *(3) (specify)* to each run, shall be built up of 2 in. thick stock on edge to the required dimension. Members shall be secured together with 16 penny nails staggered and spaced 16 in. apart along both top and bottom edges. Set carriages accurately to the stair run and pitch. Fit 2 in. thick triangular blocks, cut from joist lumber to the rise and tread, on the center of each carriage accurately in line. Toe-nail each block to the carriage.

Note: *Omit (14d) if strings are used.*

(15) Sub-flooring

Note: *See (4o), page 8.*

(15a) Except as hereinafter noted, all sub-flooring shall be laid diagonally at approximately 45° with the boards of alternate stories run at right angles to those above and below.

(15b) All sub-flooring shall be fitted tightly together and nailed to each bearing with 8 penny nails, two to each board 4 or 6 in. wide, three to each board 8 in. wide and four to each board 10 or 12 in. wide.

(15c) All joints shall be broken and made directly over the center of a joist, unless end matched material is used, when the joint may occur over or between the joists, provided the joints in two adjacent boards do not occur over the same joist or between the same two joists.

(15d) Except as hereinafter noted, the sub-flooring shall be continuous across the building. Where bearing partition studs extend below the top of the floor joist, the sub-flooring shall be cut to fit around each stud with the ends supported on cleats.

(15e) At the outside walls the sub-flooring shall extend to the outside face of studs where box sill or platform frame is used, otherwise the sub-flooring shall extend to the inside face of studs.

(15f) In *(bathrooms) (kitchens) (vestibules) (specify)* where there is a *(tile) (marble) (specify)* or similar floor laid over wood joists cut in the rough flooring between the joists and secure to ledger plates to provide for a reinforced concrete bed.

(16) Wall Sheathing

Note: *See (4p), page 8.*

(16a) All sheathing shall be applied diagonally at approximately 45°, with all boards on each side of the building running in the same direction.

Note: *Diagonal sheathing is strongly recommended due to its greater bracing strength. See Fig. 32, page 14. However, where exterior stucco is applied, horizontal sheathing should always be used.*

(16b) All sheathing shall be applied horizontally.

Note: *Wherever used, wind bracing as specified in (9c2) and (9c3) should always be included. See Figs. 31 and 33, page 14.*

(16c) All sheathing shall be tightly fitted together and nailed to each bearing with 8 penny nails, two to each board 6 in. wide, three to each board 8 in. wide and four to each board 10 or 12 in. wide.

(16d) All joints shall be broken and made directly over the center of a stud, unless end matched material is used, when the joint may occur over or between the studs, provided the joints in two adjacent boards do not occur over the same stud or between the same two studs. No joint shall occur directly at the top or bottom of an opening.

(16e) The boards directly at the top and bottom of all openings shall continue to at least the second stud on each side of the opening.

Note: *Include (16e) only when horizontal sheathing is used.*

(16f) The sheathing shall be cut off at the center line of the first stud at the sides of all window and door openings, 1 in. above the bottom edge of all top headers, and flush with the top edge of the bottom headers.

Note: *Include (16f) where, as is customary, wide blind stops are detailed for window frames. Where standard brick veneer frames are used, omit this clause.*

(16g) All sheathing shall be continuous except for openings and shall extend full width to the outside edge of corner studs and to or below the bottom edge of the sill as detailed. Boards shall be notched to fit closely around all rafters at the eaves and shall extend up and be trimmed off flush with the top edge of all rafters.

(17) Roof Boarding

Note: *See (4q), page 8.*

(17a) All roof boarding shall be laid at right angles to the rafters.

(17b) All boards shall be fitted tightly together and nailed to each bearing with 8 penny nails, two (2) to each board 4 or 6 in. wide, three (3) to each board 8 in. wide and four (4) to each board 10 or 12 in. wide.

(17c) All joints shall be broken and made directly over the center of a rafter, unless end matched material is used, when the joint may occur between the rafters provided that the joints in two adjacent boards do not occur between the same two rafters.

(17d) All boards supporting the end rafters or barge boards shall be long enough to extend over at least two of the regular rafters.

(17e) Form all crickets, saddles, etc. *(back of chimneys) (specify)* etc. as may be required to drain the roof areas properly to *(gutters) (leader drains) (specify)*. They shall be formed of accurately fitted roof boarding secured to strongly braced framing built on top of the regular roof boarding.

(18) Building Paper

(18a) Cover all sheathing and roof boarding with building paper, laid at right angles to the studding and rafters, lapped at least 2 in. at joints to shed water and adequately secured with nails driven through standard galvanized sheet-metal washers or lath cleats.

(18b) When window and door frames are installed provide and install 8 in. wide strips of building paper, secured over the frames back of outside casings and lapping over the regular building paper.

ENGINEERING DATA—For Determining the Correct Sizes of Wood Columns, Girders, Joists and Rafters

STANDARD SIZES OF LUMBER

Recommended by U. S. Department of Commerce

Type of Lumber	Nominal Size		Actual Size S4S At Comm. Dry Shp. Wt.	
	Thickness	Width	Thickness	Width
Dimension **4-SQUARE Guide-Line FRAMING**	2 in.	4 in.	1⅝ in.	3⅝ in.
	2 in.	6 in.	1⅝ in.	5⅝ in.
	2 in.	8 in.	1⅝ in.	7½ in.

50,000	8x8	8x8	8x8	8x8	8x8	8x8
55,000	8x8	8x8	8x8	8x8	8x8	8x8

Reference—Page 50, Bulletin No. 145, National Committee on Wood Utilization, U. S. Department of Commerce, "Light Frame House Construction."

Instructions for Determining Column Sizes

First—Use the total load per linear foot of girder obtained when determining girder sizes.

Second—Determine length of girder span being supported by column (see diagram, page 19) (this is equal to one-half total distance from column measured both ways to next column or bearing wall, except when the girder is continuous over this column and broken over the column or bearing wall on each side in which case it is equal to ⅝ this total distance).

Third—Multiply the length of this span in feet by load per linear foot.

Fourth—Refer to table. Read down in column at left to load already determined—then across to column corresponding to length of column (distance from concrete footing to under side of girder). The figure at this intersection represents the size of column required.

WOOD GIRDERS

SIZES OF BUILT-UP WOOD GIRDERS FOR VARIOUS LOADS AND SPANS

Based on Douglas Fir 4-SQUARE Guide-Line FRAMING

Deflection not over 1/360 of Span—Allowable Fiber Stress 1600 lbs. per sq. in.

Load per Linear Foot of Girder	Length of Span				
	6′-0″	7′-0″	8′-0″	9′-0″	10′-0″
	Nominal Size of Girder Required				
750	**6x8 in.**	**6x8 in.**	**6x8 in.**	**6x10 in.**	**6x10 in.**
900	6x8	6x8	**6x10**	6x10	**8x10**
1050	6x8	**6x10**	**8x10**	**8x10**	**8x12**
1200	**6x10**	**8x10**	8x10	8x10	8x12
1350	6x10	8x10	8x10	**8x12**	**10x12**
1500	**8x10**	8x10	**8x12**	**10x12**	10x12
1650	8x10	**8x12**	**10x12**	10x12	**10x14**
1800	8x10	8x12	10x12	10x12	10x14
1950	**8x12**	**10x12**	10x12	**10x14**	**12x14**
2100	8x12	10x12	**10x14**	10x14	12x14
2250	**10x12**	10x12	10x14	**12x14**	12x14
2400	10x12	**10x14**	10x14	12x14	
2550	10x12	10x14	**12x14**	12x14	
2700	10x12	10x14	12x14		
2850	**10x14**	**12x14**	12x14		
3000	10x14	12x14			
3150	10x14	12x14			
3300	**12x14**	12x14			

The 6-in. girder is figured as being made with three pieces 2 in. dressed to 1⅝ in. thickness.

The 8-in. girder is figured as being made with four pieces 2 in. dressed to 1⅝ in. thickness.

The 10-in. girder is figured as being made with five pieces 2-in. dressed to 1⅝ in. thickness.

The 12-in. girder is figured as being made with six pieces 2-in. dressed to 1⅝ in. thickness.

Note—For solid girders multiply above loads by 1.130 when 6-in. girder is used; 1.150 when 8-in. girder is used; 1.170 when 10-in. girder is used and 1.180 when 12-in. girder is used.

Reference—Page 33, Bulletin No. 145, National Committee on Wood Utilization, U. S. Department of Commerce, "Light Frame House Construction."

Instructions for Determining Girder Sizes

First—Refer to diagram on page 19 and using it as a guide, determine for each floor the length of joist spans that are to be supported by the girder. For the first floor it is equal to one-half the total distance from center line of girder measured both ways to the next girder, basement bearing partition or foundation wall, except when joists are continuous over this girder and broken over nearest support on each side, in which case it is equal to ⅝ this total distance. Use the same method for second and third floors and roof when part of that weight is to be supported by the girder through the bearing partition, struts, etc. In the case illustrated in diagram on page 19, it is equal to 12 feet for all three floors and 18 feet for the roof.

Second—Multiply the load per square foot, as indicated on

the chart, for each of these floors and roof by the various spans, including 20 lbs. per square foot of floor area for first and second story partitions. (In this case it is 2880 lbs.)

(First Floor plus partitions.....70 lbs. × 12 ft.— 840 lbs.)
(Second Floor plus partitions.....80 lbs. × 12 ft.— 960 lbs.)
(Attic Floor, not floored.....30 lbs. × 12 ft.— 360 lbs.)
(Roof .....40 lbs. × 18 ft.— 720 lbs.)
(Total .....2880 lbs.)

The total represents the load to be supported by the girder for each foot of its length.

Third—Determine length of girder span (distance between columns).

Fourth—Refer to table, read down in column at left to load already determined—then across to column corresponding to length of span to be provided for, the figure at this intersection represents the size of girder required.

WOOD JOISTS

SIZES OF JOISTS FOR VARIOUS SPANS AND LOADS
JOISTS SPACED 16 IN. O. C. UNIFORMLY LOADED
Based on Use of 4-SQUARE Guide-Line FRAMING

(Plastered Ceiling Below—Deflection not over 1/360 of Span)

18′-0″	2x10	2x10	**2x12**	2x12	2x12	2x12	2x12			
18′-6″	2x10	2x10	2x12	2x12	2x12	2x12				
19′-0″	2x10	**2x12**	2x12	2x12	2x12					
19′-6″	**2x12**	2x12	2x12	2x12	2x12					
20′-0″	2x12	2x12	2x12	2x12						

Note—2x4 in. Douglas Fir may be used for ceiling joist (having no live load) up to 10-ft. spans. 2x4-in. West Coast Hemlock may be used for ceiling joist (having no live load) up to 9 ft. 6-in. spans.

Reference—Page 57, Bulletin No. 145, National Committee on Wood Utilization, U. S. Department of Commerce, "Light Frame House Construction."

Instructions for Figuring Joist Sizes

First—Determine maximum joist span for each floor.

Second—Determine amount of live load to be provided for from local Building Code (usually this is 40 lbs. per square foot for all floors used for living purposes and 20 lbs. for attic floors, used for light storage).

Third—Refer to table. Read down in column at left to the length of span already determined—then across to the column corresponding to live load to be provided for and species of wood to be used. The figure at this intersection represents size of joists required.

WOOD RAFTERS

Instructions for Figuring Rafter Sizes

First—Determine length of rafter span by measuring distance from plate up to next support. This can be a partition or strut brace extending up from a partition provided these struts are set not to exceed 4 feet apart and are capped with a plate set on edge. The presence of collar beams will permit increasing the span but should not be considered as a support.

Second—Determine amount of live load that shall be provided for from local Building Code—usually this is 30 lbs. per square foot of horizontal surface.

Third—Refer to table of rafter sizes. Read down in column at left to length of span—then across to column corresponding to live load that must be provided for and species of wood to be used. The figure at this intersection represents the size of rafter required.

SIZES OF RAFTERS FOR VARIOUS SPANS AND LOADS

Rafters Uniformly Loaded—Slope of 20° or More—Spaced 16 in. O. C.—Not Plastered

Based on Use of 4-SQUARE Guide-Line FRAMING

Span—Unsupported Lengths from Plate to Ridge—Without Collar Beams

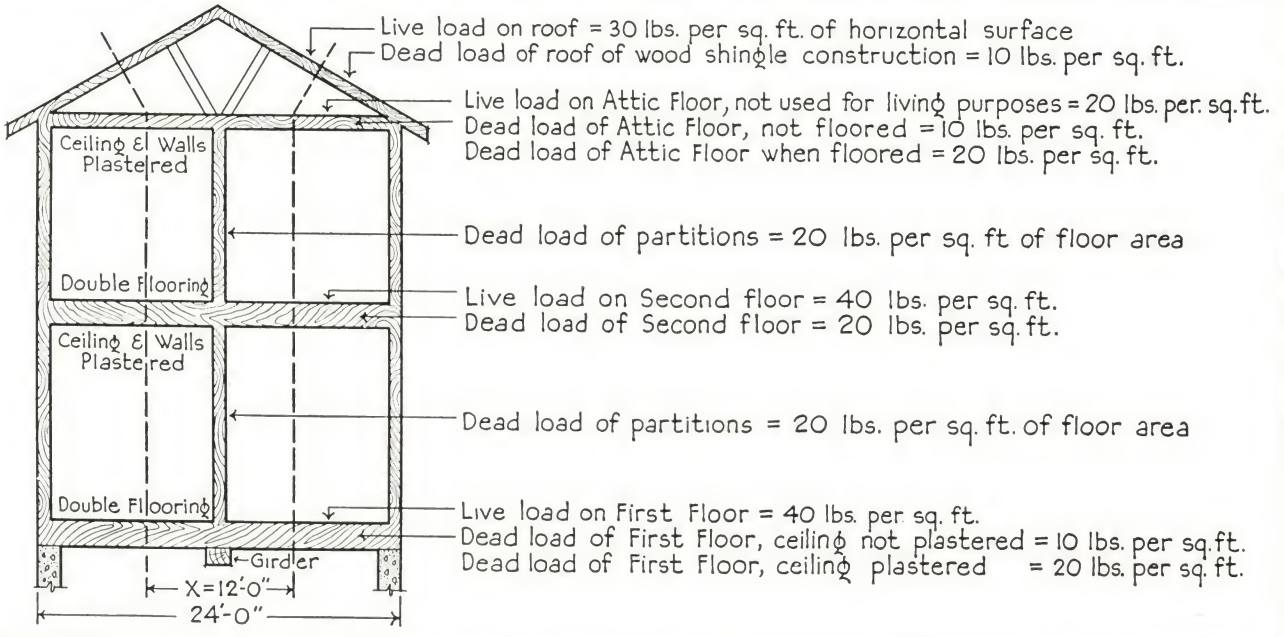
17′-6″	2x8	2x8	2x8					
18′-0″	2x8	2x8	2x8					

Note—Allowable fiber stress for Douglas Fir—1200 lbs. per sq. in.



Allowable fiber stress for West Coast Hemlock—1040 lbs. per sq. in.

These figures provide for Dead Loads as follows: Weight of Rafters; Weight of Roof Sheathing (2.5 lbs. per sq. ft.); Weight of Roof Covering (2.5 lbs. per sq. ft.).

This roof covering will provide for wood shingles, metal sheets, metal tile or composition roofing. If heavier material is used, make the necessary allowance by using figures for a proportionately heavier live load.

DIAGRAM SHOWING METHOD OF FIGURING LOADS FOR HOUSE FRAMING

4 SQUARE Guide Line FRAMING

WARREN ROSS LUMBER COMPANY

Oldest and Largest Merchants of Cherry Lumber, Panels and Veneers

JAMESTOWN, N. Y.

"ROSSCO" CHERRY LUMBER, PANELS AND VENEERS ARE IDEAL FOR INTERIOR TRIM

Specification

In writing Specifications, it is not enough to specify Cherry. You want superior Cherry. Therefore, specify by name, "Rossco" Cherry—a guaranteed product—"*good for the life of the building.*" And, for best results from "Rossco" Cherry, specify as follows:

Authorized Specification—The cabinet trim to be used in ..... building, to be manufactured from WARREN ROSS LUMBER COMPANY'S (Jamestown, N. Y.) "Rossco" Cherry, Select Grade A. For Panels, specify Grade A. For Veneers, specify Grade A.

Character

Cherry is considered by many authorities to be the most distinctive of the many woods used for interior cabinet work. This intriguing wood has an appealing charm and character all its own.

Lignification

The cohesion of the spring and summer wood in the lignification is superior to many other woods. This assures no end grain raising, no end or side expansion, no cupping, warping, twisting or curling of the wood.

Shrinkage

Leading American Architects specify Cherry for the best homes and buildings, because the moisture content in this wood is the lowest. The shrinkage in Cherry from green to oven dry, radial and tangential, is 10.8 against 12.3 to 16.9 for other American cabinet woods. This tells its own story.

In a porous wood, the atmospheric pressure forces moisture into the cells and cellular walls, and the vacuum in a porous wood draws the moisture in as well; a double reason why wood contains moisture. Varnish or paint does not prevent moisture from entering into the cellular walls of wood; it only retards it. Cherry is low in moisture content, because its structure is very free from pores. Consequently, *Cherry has no center expansion caused by moisture,* which forces lesions in the surface, causing the varnish, *paint,* lacquer or *enamel* to *crack, crock, peel* and *flake.* Cherry makes a superior paint or enamel base.

Cost

Cherry is 35% cheaper than the better mahoganies and walnut, and the utilization is much greater than in the latter. It costs 10% to 25% more than the cheaper woods. However, Cherry costs less in the end, because a good enamel will often last 20 or more years on Cherry, while on other woods, a renovation is required every few years, if the trim is maintained in proper condition.

Colors

Due to its structural texture, it is admitted that Cherry is susceptible of a finer color discrimination than any other wood. Any color dreamed or desired can be obtained on Cherry. There is no end grain to raise; it requires no sponging or extra sanding.

Supply

Our resources are ample and available supplies are sufficient to take care of all present and potential demands for our celebrated Cherry.

Recent Installations Done in "Rossco" Cherry

These buildings are the finest of their type built in the world during the past year:

The New Waldorf-Astoria Hotel, New York, N. Y., Lobby and entrances—"Rossco" Cherry ebonized.

The Aetna Life Insurance Company Building, Hartford, Conn.—Principal rooms, "Rossco" Cherry. Business Men's Club in Cherry color tones, balance enamel.

Museum of the City of New York—"Rossco" Cherry. Library, Cherry color tone, balance enamel, basement to attic.

Union League Club, New York City—"Rossco" Cherry, enamel.

Administration Building Board of Education, Philadelphia, Pa.—"Rossco" Cherry, Cherry color tone and enamel.

We will gladly submit on request photographs of above interiors for Architects' inspection.

Endorsement

New York, Oct. 6, 1931.

"In answer to your inquiry as to the position Cherry, as a finishing wood, occupies in the minds of architects, we feel that it is a most excellent wood but it has almost been out of the market. We have always found it to be dependable, free from warp, or buckle, to have a minimum shrinkage and to take an excellent finish."

Yours very truly,
McKIM, MEAD & WHITE.
By L. R. Holske.

Authorized Agents

Our celebrated and famous Red Cherry is worked into fine cabinet trim to architects' specifications by the following:

Irving & Casson, A. H. Davenport Co., Boston, Mass., and New York, N. Y.
Geo. W. Smith Woodworking Company, Philadelphia, Pa.
William Somerville, Inc., New York, N. Y.
Peck Lumber & Manufacturing Co., Scranton, Pa.
Rauwald Woodwork Company, Milwaukee, Wis.
National Lumber Company, South Bend, Ind.
A. H. Ramsey & Sons, Inc., Miami, Fla.
McCormick-Hannah, Inc., Orlando, Fla.
Duval Planing Mill Co., Jacksonville, Fla.
Sheboygan Woodworking Co., Sheboygan, Wis.

Our mills satisfy. Only the highest class interior finish mills are appointed as our agents. They use exclusively "Rossco" Cherry, which is selected with the utmost care.

The Above Room Finished in "Warren Ross Lumber Company's Select Grade A Cherry"

It is the Board Room in the Aetna Life Insurance Building and Affiliated Companies and is a beautiful example of the woodworker's art.

It is an exact reproduction of the Revolutionary Home of Matthias Hammond at Annapolis, Maryland. The table and ten Chippendale chairs were used by Thomas Jefferson at Monticello.

This is the largest building of its kind in the world devoted exclusively to insurance purposes, and our Famous Cherry was used in the best rooms

ARKANSAS SOFT PINE BUREAU

LITTLE ROCK, ARK.

Products

ARKANSAS SOFT PINE INTERIOR FINISH, stock and special patterns; QUARTERSAWN (EDGE GRAIN) FLOORING; MOULDINGS; SOFT, NON-SPLITTING PLASTER LATH; COMMON LUMBER.

Sold by

Local lumber dealers and planing mills east of the Rockies.

Individual Advantages

Arkansas Soft Pine is the highest quality short leaf southern pine, known botanically as *pinus echinata.*

Due to its workable character and also because of certain definitely individual qualities—freedom from excessive pitch, light weight, soft lustrous texture and fine grain—the wood has received a marked preference, especially for interior finishing and woodwork.

Because of its tough fibered, non-resinous make-up, it yields readily to edged tools and does not "gum" saws, knives or chisels.

General Uses

Arkansas Soft Pine in the common grades supplies an all-around framing material for residences, stores, apartments, churches and buildings of like character.

Specific Uses

Satinlike Interior Trim—It is from the thick, clear, sap wood with its fine lustrous texture and virtual absence of resinous oils that the highest grade of interior trim is manufactured; and it is because of the large percentage of this clear material, peculiar to South Central Arkansas timber, that Arkansas Soft Pine attains its maximum of value, merit and beauty when employed as interior trim.

Flooring—Arkansas Soft Pine flooring is manufactured in approximately ten grades. Edge grain is the most satisfactory and admits of no pieces in which the angle of the grain exceeds 45° from vertical to any point.

The preferred pattern measures $\frac{25}{32}$ in. by 2⅜-in. face and usually runs 8 to 20 ft. in length, the greatest percentage being 10 to 16 ft. In the finished floor these long lengths entail comparatively few end joints and Arkansas Soft Pine Floor is therefore better looking, firmer and less costly to lay.

The finished floor will take any desired treatment in stain, varnish, gloss or wax, and produces a hard wearing floor of attractive appearance.

Knotty Panelling—Manufactured from Arkansas Soft Pine No. 1 Common, S4S selected for sound knots, freedom from split, worm holes, wind shake or torn grain; re-kiln dried to moisture content of B & Better finish. Sizes $\frac{25}{32}$-in. thickness by 4 to 12 in. Panels are usually made up of one 12-in. width and two 8-in. widths with the 12-in. width in the center. Stiles and rails are B & Better finishing available in same thickness and widths. Mouldings per 8000 or 7000 Moulding Book (copies on request from Bureau).

Clear Panelling—Same as Knotty Panelling, except specify *all* B & Better grade.

Note: All stock bears the Arkansas Soft Pine registered trademark and grademark.

Individual Treatment for Stains and Enamel Finishes

Contrary to the necessary preliminary shellacking or filling of certain pine, often required to neutralize resin or oily content, stains are applied *directly* to Arkansas Soft Pine, permitting the color to permeate the fiber of the wood evenly, resulting in a uniform color throughout the piece.

When white or tint enamels are used, a preliminary coat of very thin shellac is applied, followed by the initial coat of zinc or lead. These first applications are likewise evenly absorbed and the subsequent coats are thus built up upon the wood itself and not upon a crust of heavy shellac. This factor of proper absorption is definite assurance against ultimate checking of enameled surfaces.

Arkansas Soft Pine for Knotty Panelling

Charm Obtained with Arkansas Soft Pine Interior Finish
This satinlike interior trim provides beautiful enamel work

Properly Balanced Absorption

Any prejudice which may have existed against soft woods for interior trim has been due in part to the tendency of some of them to over-absorb varnishes or enamels.

Arkansas Soft Pine is not of that corklike softness which literally drinks up oil and varnish. The tough fiber prevents that possibility; moreover, the finished surface will hold its luster permanently.

For Tints or White Enamel

Particular emphasis is laid on the merit of this wood as a base for painted and enameled woodwork. The absence of resin or oil content insures against any possibility of staining the surface from underneath. The close fiber takes the tinted or white coat with a perfectly uniform absorption, nor is any trouble experienced with raised grain, as the fine uniform texture and freedom from hard streaks prevent such tendency.

Proper Sanding

A prime prerequisite is that flat faced finish shall be machine sanded. This method is preferable, for it insures a smooth polished surface on the natural wood and eliminates the liability of scuffing the sap growth as it is often done when worked on the bench by hand. The Arkansas Soft Pine manufacturers now sand their interior finish at the mills, including stock of standard length and that sold in package units.

Source of Supply

Arkansas Soft Pine attains its greatest degree of perfection in the south central section of the state for which it is named. Certain favorable geological, topographical and climatic elements contribute to this condition; as for example, soil properties, rainfall and drainage. The ARKANSAS SOFT PINE BUREAU is composed exclusively of manufacturers whose plants are located in this identical region.

Grademarked, Trademarked Lumber

The product of these mills is grademarked according to the recommendations of the Hoover Standardization Committee, and also bears the registered trademark shown on the preceding page. These brands guarantee standard grades, uniform manufacture, scientific drying and seasoning and correct handling.

GRADE 

MARK

This Grademark Is Your Guarantee of Standard Quality Lumber and Woodwork

For Your Information

In addition to the handbook described later, literature on painting and finishing, together with finished and natural samples, will be sent on request. Also brochure containing 25 architectural competition designs and building data.

Specifications

(1) Arkansas Soft Pine, stamped with trademark and grademark of the ARKANSAS SOFT PINE BUREAU, shall be used throughout for structural and finishing purposes, as specified below.

(2) All lumber used shall conform to the grading rules of the Arkansas Soft Pine Handbook.

(3) **Framing**—All framing timbers, joists, girders, studs, etc., shall be Arkansas Soft Pine [No. 1 Common] [No. 2 Common] grade, of standard sizes.

(4) **Sheathing**—All outside walls and roofs shall be covered with Arkansas Soft Pine [shiplap] [sheathing boards], No. 2 Common grade. Sheathing boards shall be surfaced [one] [two] sides, shall be well nailed to the studs and shall be laid diagonally.

(5) **Window and Door Frames**—Shall be Arkansas Soft Pine rabbetted and moulded as detailed and of dimensions shown.

(6) **Exterior Trim**—Shall be Arkansas Soft Pine, [B & Better finishing grade] ["C" finishing grade], and shall be worked strictly in accordance with the scale and detail drawings.

(7) **Bevel Siding**—All exterior walls, as shown or noted on the drawings, shall be covered with Arkansas Soft Pine bevel siding of B & Better grade, laid [2½ in. in 4-in.] [4 in. in 6-in.] width to the weather.

(8) **Lathing**—All walls and ceilings to be plastered shall be covered with Arkansas Soft Pine lath, No. 1 grade, laid horizontally, 2 in. on centers, with breaking joints. In no case shall the lath be laid vertically and all lath shall be well nailed to every stud or other bearing, using 4 nails to the lath.

(9) **Subflooring**—On all floors throughout, except as otherwise shown or noted, lay Arkansas Soft Pine subflooring, [No. 2 Common] [No. 3 Common] grade shiplap, each board well nailed to every joist.

(10) **Finish Flooring**—In (locations) ..... lay a finish floor (after plastering is completed) of Arkansas Soft Pine, edge grain, Grade ["A"] [B & Better], tongued and grooved and well strained and blind nailed to every [joist] [sleeper] with two 8d cut flooring nails.

(11) After laying, the finish floors shall be well protected by covering them with heavy paper, or other approved material.

(12) **Interior Trim**—Shall be Arkansas Soft Pine, Grade B & Better, worked in strict accordance with scale and detail drawings (or selected from the ARKANSAS SOFT PINE BUREAU Handbook).

(13) **Mouldings**—All mouldings shall be run true and straight, carefully worked and finished, or may be selected from the Handbook of the ARKANSAS SOFT PINE BUREAU, as designated by the numbers specified or shown on the drawings (in accordance with the detail drawings).

(14) All flat-surfaced trim shall be triple machine sanded before installation, and shall be turned over to the painting contractor ready for finishing. All nailholes shall be puttied up, using putty to match the color of the wood, and all wood that is to be stained shall have all finger marks removed.

(15) **Painting and Finishing**—All stains shall be applied directly to the wood without the use of filler, and followed by the subsequent coats of varnish as called for.

(16) Where tint or white enamel finish is called for, 1 coat of thin shellac followed by 2 coats of enamel undercoating and 2 coats of enamel white or desired tint (detailed instructions on request).

Arkansas Soft Pine Handbook

The Arkansas Soft Pine Handbook contains complete grading rules, standard moulding designs, including numbers agreed to by the American Institute of Architects in conjunction with the Central Committee on Lumber Standards; also lumber actuary, shipping weights, painting and finishing instructions, and concise description of the wood. Sent on request. Also natural and finished samples.

Member Companies

All stock bearing the Arkansas Soft Pine trademark and grademark is manufactured and sold exclusively by the following companies, who also adhere to the practice of grade markings:

CADDO RIVER LUMBER CO., Rosboro, Ark.
Sales Office: R. A. Long Building, Kansas City, Mo.
CROSSETT LUMBER CO., Crossett, Ark.
DIERKS LUMBER & COAL CO., Dierks, Ark.
Sales Office: Gates Building, Kansas City, Mo.
FORDYCE LUMBER CO., Fordyce, Ark.
SOUTHERN LUMBER CO., Warren, Ark.

The above companies compose the ARKANSAS SOFT PINE BUREAU, Little Rock, Arkansas.

JOINTITE LUMBER

THE JOINTITE COMPANY

Boyle and Clayton Avenues
ST. LOUIS, MO.

A NEW AND BETTER WAY OF JOINTING LUMBER

Specified instead of tongue-and-groove or shiplap. Makes a more rigid and level surface

JoinTite
TRADE MARK REG. PATENTED

A Positive Locking Device

JoinTite units lock together to form practically a solid mass of lumber over any surface to be covered.

Quickly Put Together

The Jointite design is so simple and foolproof that construction is speeded up amazingly when JoinTite Lumber is used. JoinTite saves from 15% to 25% in labor.

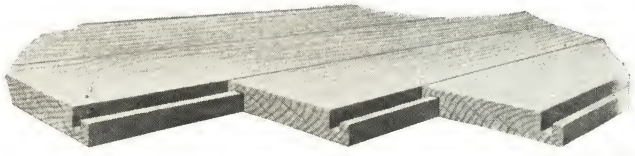
Locks Like Hands

Reversible Surface

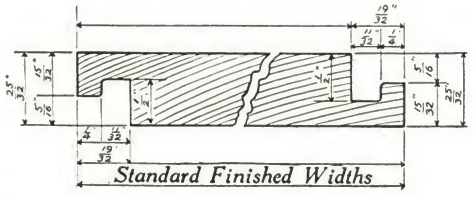
Provision for Shrinkage and Expansion

JoinTite design provides ample allowance for the natural shrinkage and expansion in any species of lumber.

Weatherproof Construction



JoinTite is actually a *weatherstripping*. Its novel design provides protection against the elements. No battens are needed when JoinTite Lumber is used.



Self-aligning and Self-leveling

Level the *first piece* of JoinTite Lumber and the JoinTite design does the rest. Variations of alignment and of level that so often develop in applying tongue-and-groove lumber are eliminated.

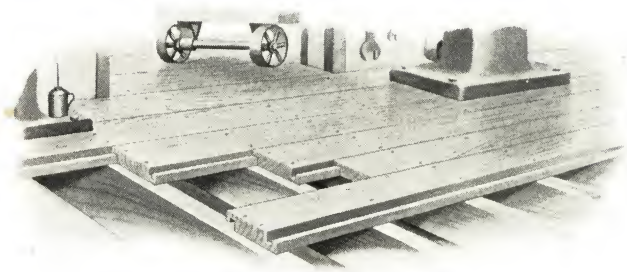
Adapted for Caulking

For refrigerator cars, ice houses, packing houses and other types of construction requiring tight, waterproof joints, JoinTite Lumber can be caulked more effectively than the old designs.

Jointite Standard Pattern

Manufactured in all patterns of floors, siding, partitions, ceilings, etc.

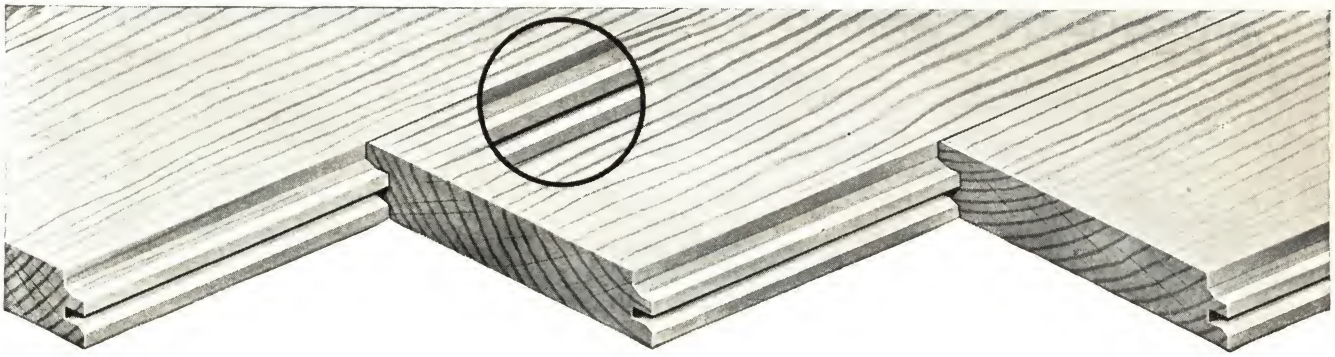
Anything Built of Lumber Can Be Built Stronger and Tighter with JoinTite Lumber



JoinTite Lumber is a combination of shiplap and tongue and groove. It is made from selected lumber, kiln dried and is graded according to all association rules of various lumber species. Every variety and dimension to meet your requirements.

On account of the tight waterproof joint possible with the Jointite interlocking design, it has been adapted for many uses where formerly ordinary shiplap, or tongue and groove had been used.

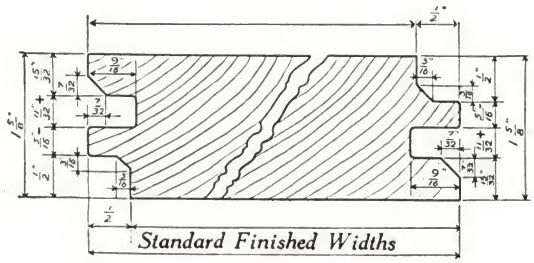
JoinTite has been used for form lumber, beams, and columns for the St. Louis Mart with perfect satisfaction to architects, contractor and owner.



For form lumber on the Illinois Terminal Warehouse, St. Louis, Mo.

For brine tanks and general usage on the Armour and Co. plants at East St. Louis.

JoinTite Sheet Piling



The JoinTite design is ideal for sheet piling. Write for special details.

JOINTITE "DTG"

JOINTITE "DTG" (DOUBLE TONGUE AND GROOVED) PATTERN

For Factory Flooring, Roofing, Concrete Forms and Other Uses

Made in All Standard Widths

JoinTite "DTG" Pattern Better for Blind Nailing— No Splitting of Material

Note the double tongue-and-groove design, with bevel surface provided for exact blind nailing. See how the nailing space acts as a guide, preventing splitting of material.

Reversible Joint Saves Time

JoinTite "DTG" pattern boards are instantly reversible. Use the better face, by just turning them over, instead of going to the trouble of up-ending.

A Weatherstrip in Itself

With its double application of tongue-and-groove JoinTite "DTG" pattern functions as an efficient weatherstripping, providing twice the ordinary resistance to the elements.

A Positive Bearing Surface

Observe the positive bearing surface of this new design both edges of JoinTite "DTG" pattern having the general effect of end-matching without additional cost.

15% to 25% Saving in Labor

Because of its much greater convenience to work with, JoinTite "DTG" pattern saves from 15% to 25% in labor. And in many types of construction there is also a considerable saving in lumber. These actual savings far outweigh the slight additional cost of the material.

It is *real economy* to use JoinTite "DTG."

Recommended Thicknesses

We recommend this type of JoinTite 1¼ in. and thicker only.

Orders Filled Promptly

An ample stock of JoinTite "DTG" Lumber in the most called-for sizes is always on hand for prompt shipments.

Further Information

Write or wire for any further information you may desire.

AMERICAN LUMBER & TREATING CORPORATION

Wolman Salts

GENERAL OFFICES

332 South Michigan Avenue

CHICAGO, ILL.

BRANCH OFFICES

NEW YORK, N. Y., 25 Broadway

ST. LOUIS, MO., Arcade Building

Products

WOLMAN SALTS, a clean, odorless and paintable Wood Preservative and Fire Retardant. Have as high toxicity as that of any wood preservative in commercial use, have no corrosive effect on metal fastenings, and do not exude after treatment.

WOLMANIZED LUMBER and TIMBER (any species of lumber, poles, posts, or forest products treated under vacuum and pressure with Wolman Salts and by the Wolman Process).

What Is Wolmanizing?

Wolmanizing is a process of preserving any kind of lumber so as to give it a high degree of protection against decay and insect attack—making it fire retardant. The preservative used in Wolmanizing is Wolman Salts.

Contractors may secure Wolmanized lumber and timbers, or have their own purchases of lumber treated at any one of a large number of commercial pressure treating plants strategically located all over the United States, so as to serve any locality. Competitive bids can be readily secured. Any first-class pressure treating plant can be quickly adapted to treat with Wolman Salts.

At each of these conveniently located points the lumber is treated by the full cell process in a closed retort under vacuum and pressure which insures a deep and dependable penetration of the preservative into all treatable areas of the wood.

A double-check analysis and technical inspection is maintained in both the manufacture of the Wolman Salts and in the Wolmanizing treatment. This insures the delivery of a constantly dependable treated lumber.

General Commercial Usages

Wolmanized lumber and timber is being specified by leading architects and engineers throughout the United States wherever protection against decay, insect attack or incipient fire is desired.

Some of these uses include roofing, flooring, subflooring, platforms, *bridge timbers,* and *planking, ties,* fencing, dock superstructures, board walks, telegraph and transmission line poles, car lumber, lining of ice houses, or wherever conditions invite decay or termite attack.

Wood treated with Wolman Salts may be painted or stained after treatment. Wolmanizing adds strength to the wood, and, therefore, resistance to abrasion. Wolmanized lumber and timber have a long, useful life, many times that of any untreated wood. The cost of treatment is no higher than other preservative treatments, often less.

Wolman Salts have a splendid 25-year record of service on a large scale in Central Europe.

Many million feet of Wolmanized lumber have been installed in the United States and Central America upon specifications of such well-known engineers as Modjeski, Masters & Chase, New York, N. Y.; The Ballinger Company, Philadelphia, Pa.; J. E. Sirrine & Co., Greenville, S. C.; Geo. E. Wells, Incorporated, St. Louis, Mo.; and many others.

Wolmanized Lumber in Yards

Many retail yards carry Wolmanized lumber in stock. If not available from your local dealer, write us for further information on prices on the treated lumber or on treatment only.

Recommended Specifications

All the timber specified to be Wolmanized, shall be given a pressure treatment of High Fixation Wolman Salts.

The Preservative—(A) The Wolman Salts (Triolith) mixture shall be composed essentially of the following ingredients for protection against *decay:*

Sodium fluoride, dinitro-phenol, and neutralizing chromates. (Free of arsenic.)

(B) The Wolman Salts (Tanalith) mixture shall be composed essentially of the following ingredients for protection against *decay* and *termites:*

Sodium fluoride and arsenate, dinitro-phenol, and neutralizing chromates.

Treatment—The treating solution shall generally have a strength of concentration in water of from 1.8% to 2% of Wolman Salts, in 98.2% to 98% of water; but the solution shall be no stronger than necessary to obtain the required retention of preservative specified below, with the largest volumetric absorption practicable.

All timber should be air seasoned until moisture content is below 20%. Green timber must be given an artificial seasoning in an airtight retort by a bath of live steam at from 10 to 15 lb. pressure for a period of 4 to 10 hours, followed by a vacuum of at least 22 in. for 1 hour or with alternating periods of vacuum and pressure, as may be found necessary to put timber into condition for treatment.

The cylinder shall be relieved continuously or frequently enough to prevent condensate from accumulating in sufficient quantity to reach the wood. After the above process, or in the case of air seasoned timber after a vacuum period at not less than 22 in. for at least 15 minutes, the preservative solution, maintained at a temperature of between 150° and 180° F., shall be admitted into the treating cylinder, without breaking the vacuum until timber is completely submerged. The preservative solution shall then be pumped into the timber under pressure sufficient to secure the desired absorption, or if this cannot be attained then under a pressure of 125 lb. per sq. in. continuing until the charge is treated to refusal. The solution shall then be quickly drained off, and the timber may be left in the cylinder to drip for about 30 minutes, or a quick final vacuum at no time greater than the minimum vacuum during submergence may be created and maintained until the charge can be removed from the cylinder free of dripping preservative; or preferably final air pressure of 50 lbs. for 15 minutes and then 75 lbs. for 15 minutes may be applied.

The amount of solution injected into the timber and its strength of concentration must be so controlled as to leave not less than (*) lb. of dry salt for each cubic foot of timber treated, and this shall permeate all of the sap wood and as much of the heart wood as practicable. No charge shall contain less than 90% nor more than 110% of the quantity of preservative specified.

Note: After treatment the lumber should be properly piled and should be allowed to dry before using, to insure against excessive shrinkage after being put in service.

When the lumber is to be painted or varnished, it is imperative that the wood be dry before applying paint or varnish.

(*) Insert the desired final retention of dry salt content, which may vary from $\frac{1}{16}$ lb. (mine timbers) to $\frac{1}{4}$ lb. (building construction) or for ties, poles and outside construction $\frac{5}{16}$ lb. of Wolman Salts for each cubic foot of the treated wood.

PROCESSED LUMBER COMPANY

FORMERLY AMERICAN WOLMANIZED LUMBER COMPANY

Wood Preservers

ELIZABETH, N. J.

Product

"AWLCO-IZED" LUMBER and SASH —for use wherever wood is subjected to moisture, humidity or other rot-producing conditions.

What "Awlco-ized" Stands For

Awlco-ized stands for undivided responsibility in lumber treated against decay. It represents a product—not simply a preservative or a process.

Complete Facilities

In addition to a modern vacuum-pressure treating plant, our facilities include a sawmill, planing mill and preframing plant, a sash and frame factory and dry kilns.

Preservative

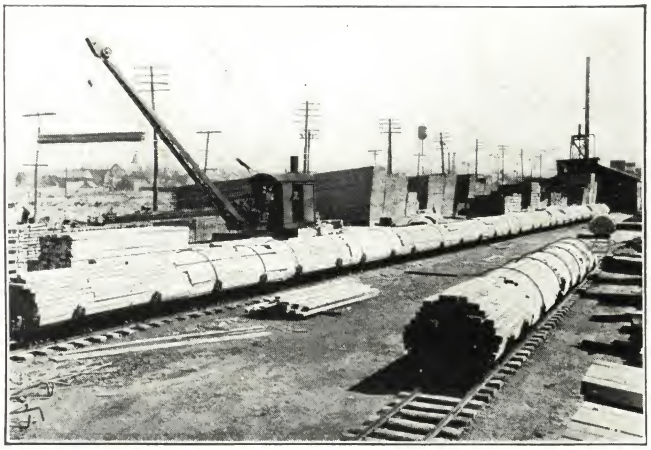
The preservative we use is the sodium fluoride-dinitrophenol-chromate combination, commonly known as Wolman Salts. Its value has been demonstrated by many years of actual service.

Treatment

This consists of impregnation to refusal by the full cell vacuum-pressure process in accordance with standard specifications of the American Wood Preservers' Association.

Properties

"Awlco-ized" lumber is clean, odorless, non-corrosive, practically colorless, burns less readily than untreated lumber and can be painted, stained or otherwise finished. All the desirable characteristics of the natural wood are retained—strength, elasticity, resiliency, low conductivity of heat and sound, together with the ease with which it is worked.



Life

The durability of lumber treated by our process is well established. "Awlco-ized" lumber can be depended upon to give at least three times the service life of untreated lumber installed under the same conditions.

The replacement of decayed wood usually involves the renewal of other materials in contact with it. With this in mind, the value of "Awlco-ized" lumber is easily appreciated. The comparatively small increase in the first cost of the building or structure is offset many times by the savings in replacement expense.

Termites

For lumber to be used in locations where attack by termites or white ants is a problem, we add an arsenical salt to our mixture, thereby giving the desired protection.

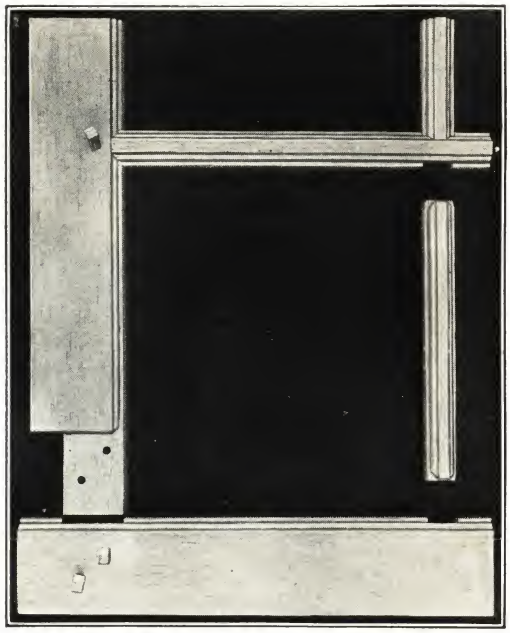
Lumber Ready to Be Charged into Treating Retort

Specialties in Stock

The following are always available for immediate shipment in carload or less than carload lots from our stock of lumber thoroughly air-seasoned after treatment:

"Awlco-ized" Yellow Pine Roof Plank —Standard 2"x6" and 3"x8", tongued and grooved plank which will effectively withstand the severe decay-producing conditions existing in dye houses, bleacheries, weave sheds, paper machine rooms and similar highly humid occupancies.

"Awlco-ized" Yellow Pine Beveled Sleepers and Underflooring for use in schools, apartment houses, hotels, churches, industrial plants and other buildings where laid in contact with green concrete or fresh cinder fill.



"Awlco-ized" Yellow Pine Furring.

"Awlco-ized" Edge Grain Yellow Pine Finish Flooring—Treated and air-seasoned in the rough. Kiln dried and dressed on order.

"Awlco-ized" Yellow Pine Trunking and Capping.

"Awlco-ized" Sash and Screen Frames—Made of carefully selected clear white pine, treated in the rough and air-seasoned four to six months. Each piece tested for complete penetration of the preservative, thereby eliminating the possibility of exposing untreated areas during manufacture.

Construction details are such as give maximum mechanical strength. Joints are made with wooden dowels and waterproof glue. Furnished glazed or unglazed; plain, primed or painted, as desired. Each sash branded and dated.

Details of "Awlco-ized" Sash Construction
Note absence of steel pins

Mill Construction, Bridges, Piers, Boardwalks, etc.

We also furnish large quantities of "Awlco-ized" structural timbers and decking for this class of work. This is all treated to order but, by drawing on our extensive untreated stock, we can make practically immediate shipment.

To Specify (Except Sash)

All.... (here insert sleepers, underflooring, etc.).... are to be of Awlco-ized Yellow Pine as furnished by the PROCESSED LUMBER COMPANY of Elizabeth, N. J.

To Specify Sash

Sash throughout (or, as noted on the drawings) shall be of Awlco-ized Clear White Pine and fabricated by the PROCESSED LUMBER COMPANY of Elizabeth, N. J., in accordance with their standard details of construction.

AMERICAN ROOF TRUSS COMPANY

Engineers and Constructors of Wood Trusses

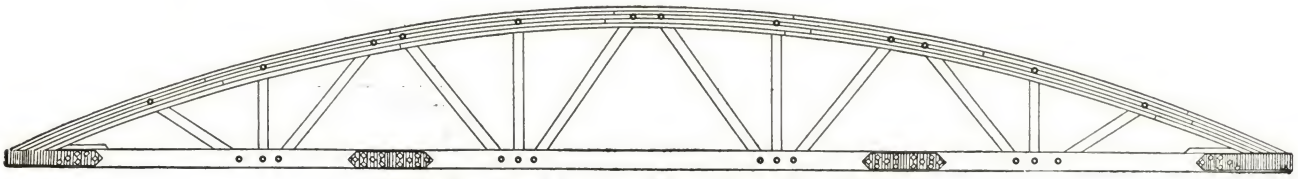
MINNEAPOLIS, MINN., Lampland Lumber Co., 1627 So. 7th Street
Telephone, Atlantic 3271

LOS ANGELES, CALIF., P. Ryersen, 4116 Folsom Street

Products

Manufacturers and erectors of:
AMERICAN WOOD BOWSTRING TRUSSES.
WADDINGTON WOOD BOWSTRING TRUSSES.
WADDINGTON WOOD CRESCENT TRUSSES.
OPEN TIMBER TRUSSES for churches.
Also Concrete Arch Bridge Supports and Wooden Bridges for golf clubs, country estates, etc.



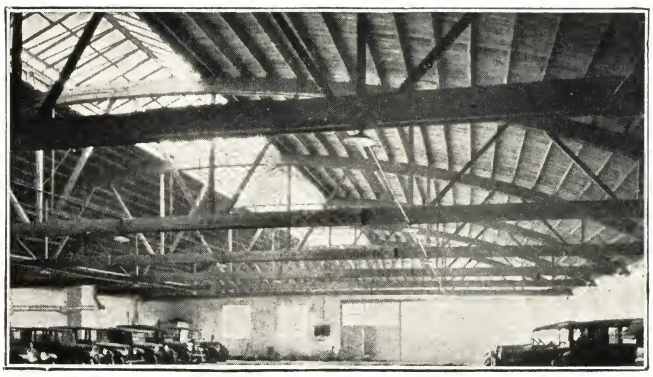
Service, Strength and Safety

Trusses are built on the job by us and erected in place as soon as pilasters are up, completely installed, ready for roof joists, anywhere in the United States, designed according to local building requirements. All trusses guaranteed.

Bowstring Trusses

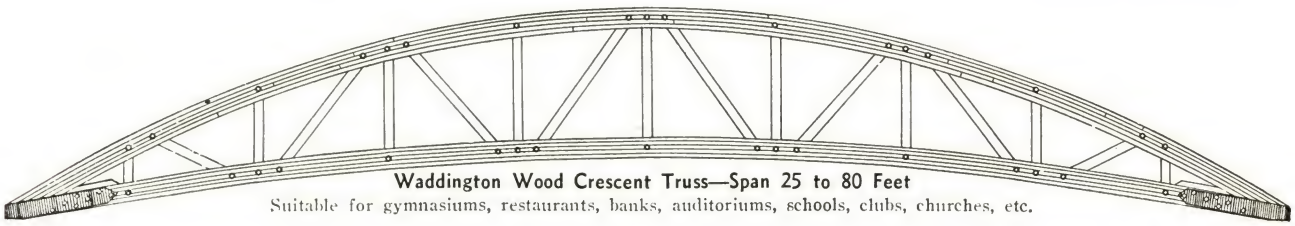
Bowstring trusses designed for 25 to 150-ft. spans. Spacing is usually 16 to 20 ft. on centers, depending on length of building.

The standard height at the center on all bowstring trusses is one-eighth of the length of the truss.



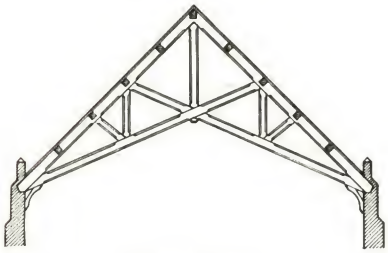
Waddington Wood Bowstring Truss—Spans 25 to 150 Feet

This truss has the ornamental splice plates and ornamental "U" straps, giving a modernistic effect when left exposed, the steel being painted at the plant. It also gives the lower chord a uniform thickness, a distinct advantage when designed for ceiling loads. The above truss is suitable for airplane hangars, skating rinks, showrooms, bowling alleys, etc.

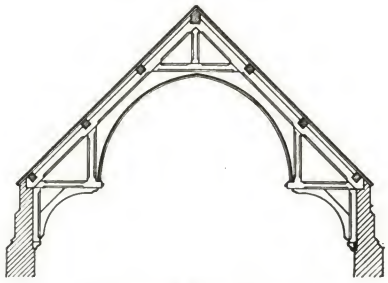


The two buildings shown in photographs below are using the American Wood Bowstring Trusses with the old-fashioned wood splice

Public Garage in New Jersey Using 75-foot Span Trusses

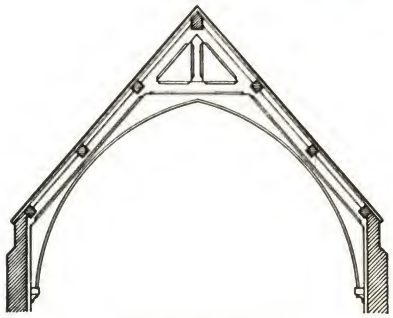


Michigan Factory Using 44 Trusses, 50-foot Span, Specially Designed



Waddington Wood Crescent Truss—Span 25 to 80 Feet

Suitable for gymnasiums, restaurants, banks, auditoriums, schools, clubs, churches, etc.



Scissors Truss

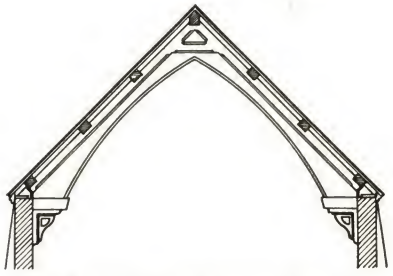
A splendid type of truss, much preferred by architects for the medium spans. Can be installed plain or with plenty of ornamentation

Hammer Beam Truss

Originated in the 12th century, and is still being used in high class church edifices

Gothic Arch Truss

For short spans this makes a very attractive truss for church work, and can also be used in high class residences and clubs



Short Span Truss

This type of truss makes a unique church design in the shorter spans. Used frequently for public libraries

Low Truss

This truss suitable for a building that requires a very small rise. Can be used in pavilions, waiting rooms, etc.

Old English Gothic Hammer Beam Truss

Used extensively in the old world colleges. Recommended for American educational institutions

Special Designs

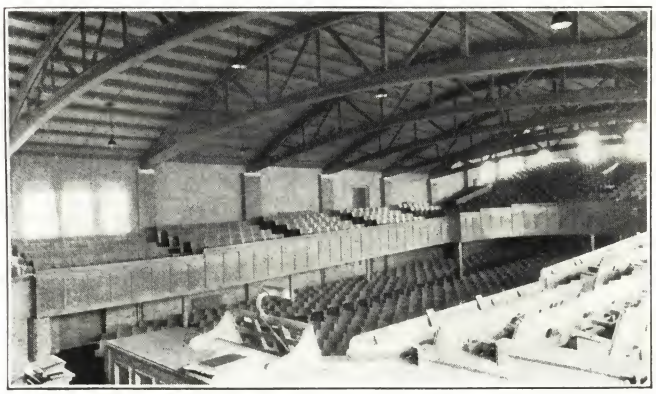
The outlines of the trusses shown above are intended to give the architect a conception of the general design so that he will use his own idea of ornamentation to harmonize with the rest of the structure.

We are glad to estimate at any time, special designs of timber trusses including the hand-made, hand-adzed, open timber types of the middle ages.

These trusses can be fabricated in Chicago and shipped to any point of the United States.

Information Required for Estimates

(1) Number of trusses required.
(2) Span out to out of walls or center of columns.
(3) Spacing between trusses.
(4) Loads. Regular roof load in pounds per square foot. State if any ceiling load. For unusual loading conditions send plan or photostat.
(5) Address of job, nature of building, owner's and architect's names.



Specifications

Roof trusses shall be furnished by AMERICAN ROOF TRUSS COMPANY, 228 North La Salle Street, Chicago, Ill., according to their structural details.

Literature

Send for illustrated folder and valuable suggestions covering economical layout and brick saving features.

Our engineers will give fullest co-operation to architects.

ARCH ROOF CONSTRUCTION CO., INC.

TELEPHONE
WIsconsin 7-5845

Engineers and Contractors
104 West 42nd Street, NEW YORK, N. Y.

Products and Service

Design, Construction and Erection of LONG SPAN ROOF ARCHES for theaters; auditoriums; convention, exhibition and fair buildings; garages; warehouses; factories; airplane and dirigible hangars; gymnasiums; skating rinks; bowling alleys, and all buildings where unobstructed space, maximum light and ventilation are desired.

ARCH ROOF CONSTRUCTION CO., INC., will design arches, supply all materials and do the erection, or ordinary materials can be supplied and erection done by local contractors.

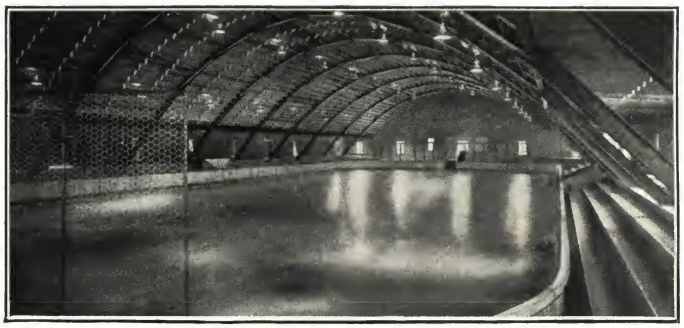
Co-operation is offered to architects, engineers and contractors in planning the most economical and efficient design for particular buildings.

A request will bring additional information.

Construction and Materials

By using straight lengths of the usual structural materials combined with special connections, a practical way has been evolved of applying the arch principle with its beauty and great strength to the economical construction of buildings having spans up to *400 feet* or more, where unobstructed space is desired.

Columns, posts and trusses are eliminated with this construction, and a clear interior giving a maximum amount of light and ventilation obtained.

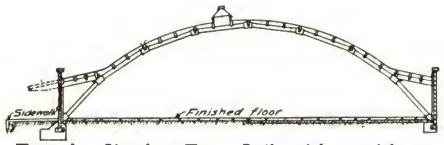


Strength

Arch roof construction can be of timber or steel or a combination of both. Standard structural shapes and sizes are employed in a patented design with patented connections to produce a roof of unusual strength. It may be fireproof, fire-retardant or non-fireproof.

Advantages of Arch Roof Construction

Maximum strength and long life. Unobstructed light and ventilation. Side walls of brick, wood sheathing, sheet iron, canvas, or folding or rolling doors. Full use of all floor space. Economy of material and labor. Temperature economically warm in winter and cool in summer. Reduced fire hazards, ease of controlling fires and low insurance rates. Added dignity, distinction and character to all long span buildings. Can be dismantled and erected with 100% salvage.



Adaptable to practically every type, style and size of building.

McKeown Bros. Company is not restricted to the building of any particular type of truss. We build for ordinary roofs, pitched roofs, curved ceilings, ornamental interiors, and for concrete arches.

Ordinary Bowstring Trusses

Built on the job and erected in place by us, or in our factory, they are influenced in the construction by years of experience. The Factory Built truss, in addition, has an upper chord glued to exact curvature and can be shipped in sections or knocked down.

Other Types of Trusses

We have no stock design of any type of truss. We aim to interpret the architect's ideas.

Construction

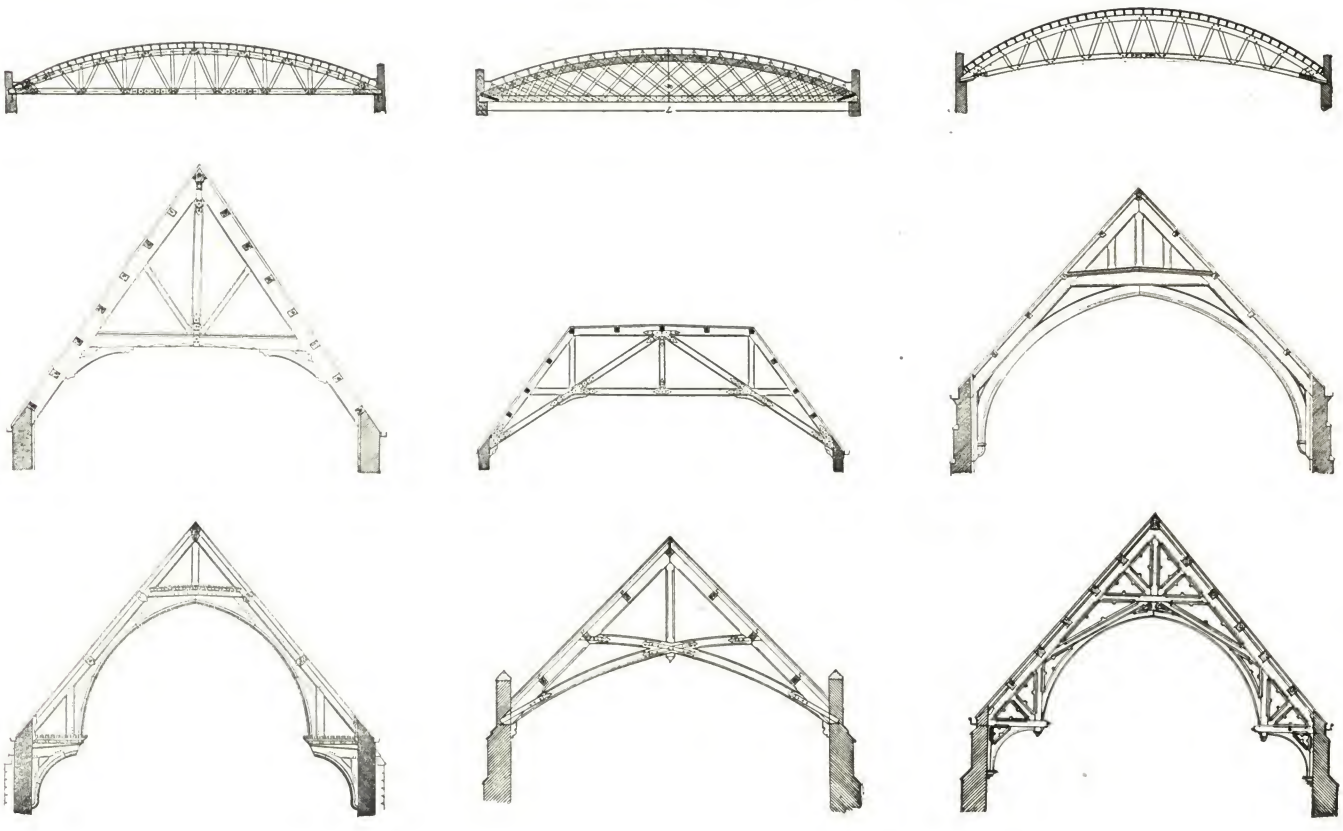
In building trusses on the site of the job, when possible, we use lumber and material from local yards, otherwise, as in the construction of Factory Built trusses, we use lumber from our own stock. This material is purchased through strict specifications, according to grading and dressing rules.

Finish

The exposed surfaces of timber trusses can be rough, rough sawn, hand adzed, hand axed, sanded, planed, sand blasted or charred.

Ornamented Ironwork

Hand-wrought ironwork of simple or complicated design made in our own shop insures the architect of faithful reproduction of his design.



Estimates

It is advisable that plans or sketches be furnished if timber trusses are desired.

For the bowstring, Crescent, etc. trusses the following information is sufficient:

(1) Number of trusses required.
(2) Over-all length of the trusses.
(3) Distance between the trusses, or spacing from center to center.
(4) Load to be carried.
(5) Location of the job.

McKeown Bros. Company *furnishes Detail Drawings and Stress Diagrams for check and approval upon receipt of the order for any type of truss.*

Product

ARCH TYPE ROOF CONSTRUCTION.

Description

Lamella Trussless Roofs, licensed, manufactured and erected by authorized licensees of the Lamella Roof Syndicate, Inc.—are roof structures designed to conform with accepted engineering practice. The design makes use of two simple and proven principles—namely, the arch and the network. The roof is made up of timbers—called lamellas—varying in section from 2x8 ins. to 6x24 ins., and in length from 8 to 24 ft. These members are bolted together to form the network.

LAMELLA
Reg. U. S. Pat. Off.

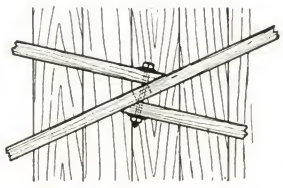

Fig. 1. Common Joint

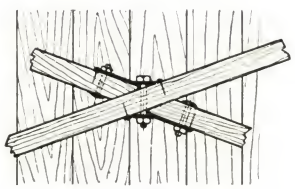

Fig. 2. Special Joint

Service

(a) Engineering—The licensees maintain engineering staffs to assist the architect in the design of the roof and its connections to other parts of the building. Detail drawings and stress calculations are promptly furnished.

(b) Construction—The Lamella stock is specially selected. A skilled and experienced crew, specializing in this type of construction, is maintained by the licensees so that the roof can be started and completed with the least possible loss of time.

Fire Resisting Qualities

Fire resisting qualities are rated in all localities equal to unprotected steel with open rafters.

They may be raised to slow burning (mill) classification by use of 4 or 6-in. material.

They may be further improved by special lumber treatment or sprinkler installation.

Acoustical Qualities

The Lamella network in its arch form pleasantly reflects the sound without causing reverberations. This has been demonstrated in the many musical halls covered with Lamella roof, some of which have successfully housed grand opera performances.

Steel Lamella Roofs

The Lamella structure may also be built using pressed or structural steel units. Steel Lamella Roofs can economically be fireproofed and are suitable for fireproof buildings of wide spans.

Data Required for Estimates

With inquiries, please give the following information:

(1) Kind of building—auditorium, garage, etc.
(2) Location.
(3) Width.
(4) Length.
(5) Height at which roof starts.
(6) Material of walls.
(7) Thickness of walls.
(8) Parapet or dripover.
(9) Size of piers, if any.
(10) Spacing of piers, if any.

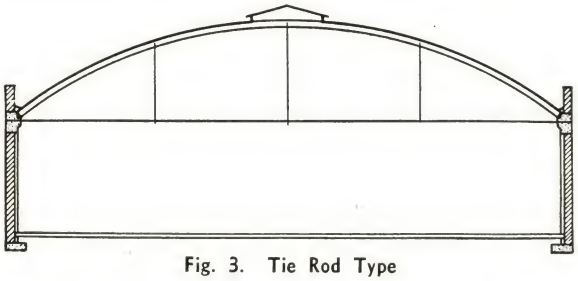

Fig. 3. Tie Rod Type

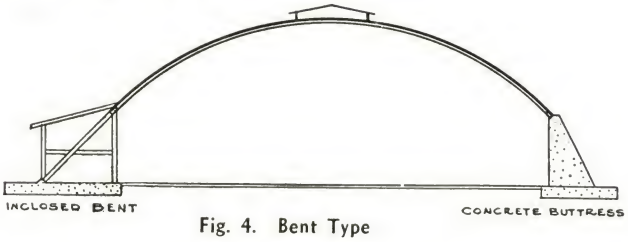

Fig. 4. Bent Type

Lamella Roofs may be curved down at the ends, thereby forming a cloistered roof of four or more sides. Their shapes may intersect to suit almost any required shape or size of building.

Products

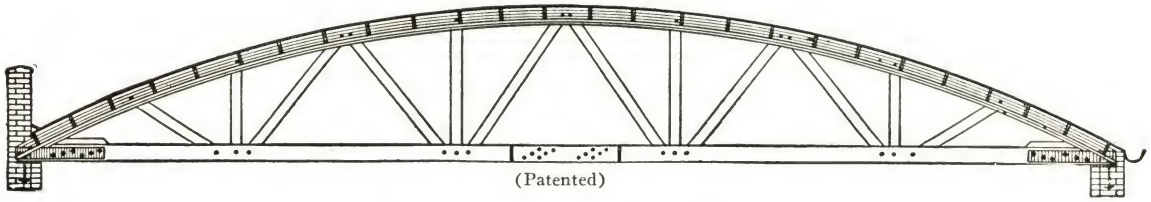
Manufacturers and erectors of Wood Roof Trusses.

Wood Roof Trusses

Spans designed from 30 to 125 ft. in accordance with best standard engineering practice and to comply with various local ordinances.

Trusses can be erected at the building site anywhere. No delays due to inability in obtaining materials; local lumber yards carry in stock all sizes of materials used in the construction of this truss.

Information Required for Estimates

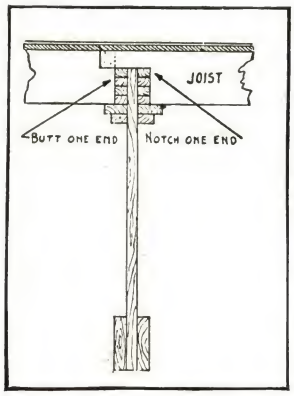


In requesting quotations the following information is necessary:

(1) Number of trusses required. (2) Span out-to-out of building walls. (3) Spacing of trusses. (4) Loads: roof, ceiling or special loadings. (5) Location of building, name of architect and owner's name.

Service

Estimates and details furnished on request.

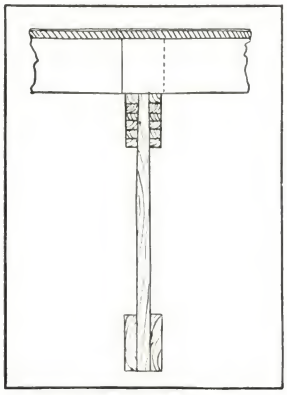


It is suggested that engineers avail themselves of our engineering service in any design calling for special types of roof trusses.

(Patented)

Summerbell Wood Roof Truss

Large solid section web members spaced far apart assure maximum light distribution. Heavy laminated top chord and bottom chord of two large solid sections reduce fire hazard. Note that the arch of the top chord is uniform from end to end and that there are no sharp breaks which cause rain to carry gravel to the gutters, or allow tar melted by the sun to run down



Section Standard Summerbell "Rigid-roof" Construction

Summerbell trusses save several courses of brick wall on all sides of the building in addition to making a rigid roof

80-ft. Span Trusses at Chicago Airport

Section of Ordinary Construction

Roof joists set on top of top chord.

Trusses of this type can be furnished, if desired

CABOT'S CREOSOTE STAINED SHINGLES

For Heat-insulating and Sound-deadening "Quilt," and for Stains, Collopakes (instead of Paint), and Wood Preservatives, see Manufacturers' Index.

Cabot's Creosote Stained Shingles

Description—Grade A, U. S. Dept. of Commerce Standard, red cedar shingles ready-stained with Cabot's Creosote Shingle and Wood Stains.

Sold in original bundles, as packed at the mill, guaranteed full count.

Preserved with genuine creosote, the best wood preservative known, and having a life at least twice as long as unstained shingles or shingles stained with nonpreservative colors.

Standard Colors—*Weathering Browns, Light and Dark Bungalow Browns, Bark Browns, Warm Brown; Light and Dark Tile Red, Maroons, etc.*—A complete range of these handsome and durable colors for roof and walls.

Light, Dark and Medium Moss Greens—Our moss greens have a richness and depth of color such as can only be produced by the strongest and purest pigments.

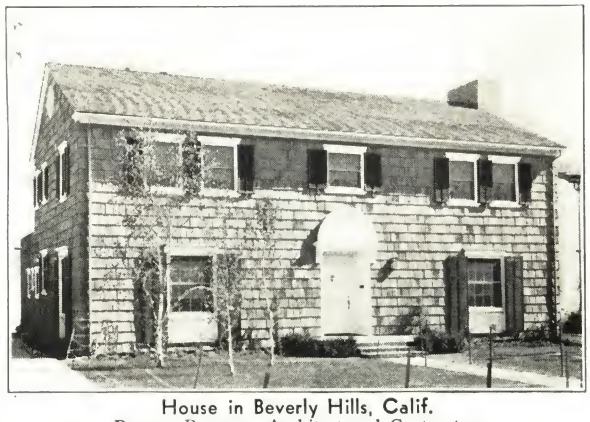
Cabot's
Creosote Stained
Shingles
Samuel Cabot Inc.

Grays—Our Weathering Grays give the true natural seashore gray tones.

White Shingles—Cabot's Shingles are also furnished ready-stained with No. 1166 White Primer, to be finished after the shingles are laid, either with (1) a brush coat of No. 1166, (2) one or two brush coats of Cabot's Old Virginia White or (3) one or two coats of Cabot's DOUBLE-WHITE. (See our pages on Collopakes [instead of Paint] for description of these materials.)

Blended Roofs—All color combinations are blended in the bundle so they can be laid without blending on the job.

Sizes



Cabot's Creosote Stained Shingles

24-in. "Royals," 18-in. "Perfections" and 16-in. "XXXX," the highest grade shingles made, are used exclusively for Cabot's Creosote Stained Shingles.

"Royals" for walls, laid with 10 to 12-in. exposure, are much more artistic than dressed siding, much warmer and the cost is actually lower. "Perfections" and "XXXX" are the standard regular sized shingles for walls and roofs.

24-in. Re-sawn, Hand-split Shakes—Flat backs; butts ¾ in. to 1¼ in. thick. These heavy and artistic shakes are rapidly gaining in popularity. They produce an effect as beautiful as tile or heavy slate and are, of course, much warmer than either, keeping out the summer's sun and the winter's cold.

Products

Originators and sole manufacturers of genuine CREO-DIPT STAINED SHINGLES, *stained under pressure,* for roofs and sidewalls.

CREO-DIPT THATCHED STAINED SHINGLES to produce the thatched roof effect.

For other Creo-Dipt products see list at top of this page and consult Manufacturers' Index.

Sold Everywhere by Leading Lumber Dealers

Creo-Dipt Stained Shingles, *stained under pressure,* are carried in stock by lumber dealers in all parts of the United States and Canada. Shipments are made from our plants at North Tonawanda, N. Y.; Cleveland, Ohio; Minneapolis, Minn.; Kansas City, Mo.; Seattle, Wash., and Vancouver, B. C.

Uniform Colors

Creo-Dipts are *stained under pressure,* after which they are given an additional treatment that applies the maximum amount of stain uniformly on the shingle. This means uniform weathering for every color—even the lightest gray shade. The heavy coat of stain prevents the usual pronounced variations in the shade of the timber from showing through, and materially lengthens the shingle's color life.

Packed in Cartons

All Creo-Dipt Stained Shingles, with the exception of Creo-Dipt Pilgrims and Aristocrats, are packed in cartons to keep them clean and free from damage while in transit, in the dealer's stock, and on the job.

Other Creo-Dipt Qualities

Creo-Dipt Stained Shingles are made only from carefully inspected red cedar, with the grain of the wood running 100% straight from top to bottom. Creo-Dipts, because of their straight grain, will lie flat without splitting or curling.

Creo-Dipt Stained Shingles effect considerable fuel savings when used on the sidewalls and roofs. Red cedar is the finest natural insulator, and Creo-Dipts overlap three times, thus giving triple protection against winter cold and summer heat. Owners tell us that the average fuel saving with Creo-Dipt varies between 15% and 25% a year.

Home of Arthur Baer, St. Louis, Mo.

BEVERLY T. NELSON, Architect

The softly sloping roof gives an air of serenity to this house on which Creo-Dipt 18-inch Perfections stained a weathered gray harmonize perfectly with the soft roof lines. The sidewalls are Creo-Dipt 24-inch Royals laid slightly staggered, and Dixie White Stain is on the chimneys.

Creo-Dipt Stain is made from the strongest pigments, ground to minute fineness in linseed oil, by our own mills. Creo-Dipt Stained Shingles, with the exception of Creo-Dipt White, do not require brushcoating after they are on the building. (See Manufacturers' Index for page on the new Creo-Dipt White.)

On Old Homes Too

Many architects are now rebeautifying old homes with Creo-Dipt Stained Shingles laid right over the old siding and roof. Write for photographs.

Sizes and Styles of Creo-Dipt Stained Shingles

Note: In specifying, give the name indicating the thickness in addition to the length of the shingles.

Thatched Effect—Special Creo-Dipt Stained Shingles are furnished for thatch roofs ready for application. Complete instructions and details will be supplied to architects and builders.

Graduated Exposure—The best effect is secured by starting at the eaves with the large Creo-Dipt Aristocrat at wide exposure, working through thinner grades at decreasing exposures up to the ridge.

Blended Color Treatment—Unusual artistic results can be obtained by using several shades of the same color starting with the darkest shade at the eaves, working to the lightest shade at the ridge.

Variegated Effects—Creo-Dipt Stained Shingles can be furnished packed promiscuously in each bundle in any proportion of the various shades which you select.

Creo-Dipt White—(See Manufacturers' Index).

Creo-Dipt Aristocrats—24 inches long; random widths; 1 inch in thickness at butt.

Creo-Dipt Pilgrims (Sometimes known as rustics or shakes)—Hand split on the weather surface and smooth sawn on the back. 25 inches long; random widths; average 1 inch in thickness at the butt. (See following page for complete information on this unusual product.)

Creo-Dipt Yorktown Shakes—Hand-split, 25 and 18 inch lengths; random widths; average ½ inch in thickness at butts.

Creo-Dipt Yorktown Shakes are exactly like Creo-Dipt Pilgrims—hand split on the weather surface and smooth sawn on the back—except that they average ½ inch thick at the butt. They are available in both 25-inch and 18-inch lengths.

Creo-Dipt Ambassadors—(Shakes) 24 inches long; random widths; 9/16 inch thick; machine grooved on the face but smooth sawn on back.

Creo-Dipt Royals—24 inches long; random widths; ½ inch in thickness at the butt.

Creo-Dipt Perfections—18 inches long; random widths; 5 shingles will measure 2¼ inches in thickness at the butt.

Creo-Dipt XXXXX—16 inches long; random widths; 5 shingles will measure 2 inches in thickness at the butt.

Covering Capacity of Creo-Dipt Stained Shingles

All shingles are sold on the basis of the square (100 square feet).

The table below shows the number of square feet a square of shingles will cover at various exposures:

Name	Exposure to the weather, in.									
	5	5½	6	6½	7	7½	8	10	10½	11
Aristocrats*	....	....	....	...*	....	75	....	100	105	110

Yorktown Shakes, 25-in.	....	....	....	....	....	62	66	82	89	90
Yorktown Shakes, 18-in.	....	66	72	78	83	89	95	....	....	....
Ambassadors*	....	....	....	....	....	75	....	100	105	110
Royals*	....	....	....	....	....	75	....	100	105	110
Perfections	....	100	111	120	129	138	148	....	....	....
Eurekas	....	100	111	120	129	138	148	....	....	....
XXXXX	100	110	120	130	140	....	....	....	....	....

*These shingles usually laid 10 inches to the weather on sidewalls and 7 or 7½ inches on roofs.

Colors

Creo-Dipt Stained Shingles are manufactured in any color or combination of colors. A color pad, showing a wide choice of shades, will be sent on request. We will make special shades or submit samples without charge.

Your Protection: The Name "Creo-Dipt" on Every Carton

The Creo-Dipt trade-mark is on every carton for the protection of yourself and your clients. For 20 years leading architects throughout the country have known it as their protection in specifying Creo-Dipts.

In writing specifications, it is recommended that you include the following:

Creo-Dipt Stained Shingles, as manufactured by the CREO-DIPT COMPANY, INC., of North Tonawanda, N. Y., shall be, etc.

Creo-Dipt Service Department

We are continually developing new and unusual combinations. Address your inquiries for further information and illustrated folders to the Service Department, CREO-DIPT COMPANY, INC., North Tonawanda, N. Y. We examine plans carefully in order to estimate the approximate number of squares of Creo-Dipt Stained Shingles required.

There is a trained Creo-Dipt salesman in your territory who always welcomes the opportunity to serve you. Look for the name "Creo-Dipt" in your telephone book.

CREO-DIPT HAND-SPLIT PILGRIMS

(Sometimes known as Rustics or Shakes)

Nature of Product

Creo-Dipt Hand-Split Pilgrims, remarkably beautiful shingles, are hand-split from first growth, live red cedar.

They are 25 inches long and average 1 inch in thickness at the butt, although this varies in individual shingles from ½ to 1¼ inches.

The surface of hand-split Pilgrims is rough and uneven, giving them a lovely ragged texture which is softened by the deep shadow lines of the thick butts.

The backs are smooth-sawn, assuring perfect watertightness when laid according to our specifications.

Uses of Creo-Dipt Hand-Split Pilgrims

Although hand-split shingles date back to the 17th and 18th centuries, Creo-Dipt Hand-Split Pilgrims are by no means limited to the Colonial house but can be used on nearly all styles of architecture.

Creo-Dipt Pilgrims are both a roof and sidewall material. You can get them in any color, stained by our patented pressure process, or unstained—just as you prefer.

Specifications

Write us, or ask our representative for complete specifications, a portfolio of Pilgrim homes and full sized samples stained in the shade you want to use.

A Pilgrim Roof for Arthur C. Webb

Designed by GUY O. KOEPP, Architect, of Carmel-by-the-Sea, Calif. This house has a roof of Creo-Dipt hand-split Pilgrims, stained red.

Creo-Dipt Pilgrims on Roof, Creo-Dipt White on Brick

Edham KOLORED Shingles

TRULY SUNFAST

PERMANENT COLORS ON RED CEDAR • IDENTIFIED AND PROTECTED BY THE RED CAPS

INDIVIDUALLY SATURATED AND PROCESSED PRESERVING THE COLOR AND THE WOOD

Protected by "Red Cap" Identification

In order that these shingles may arrive on the job, clean, unscratched and ready to use, every bundle is contained in protective end caps. This protects faces, edges and butts while shingles are being handled in the lumber yard. It keeps them free from lime, cement, dust and dirt until ready to be used

Edham Sunfast Process

A permanence of color that defies the elements is obtained by the exclusive Sunfast process of staining straight, vertical grain, West Coast red cedar shingles—immune to atmospheric changes, scorching sun, beating rain, driving sleet. Non-fading, permanent, truly Sunfast.

A Shingle Actually Sunfast

Only Nature's own true mineral colors are used, laboratory tested and scientifically mixed, with linseed and other essential oils in accordance with secret stain formulas. After thoroughly saturating and brushing the shingles, the linseed oil content of the stain is oxidized by a process of thermometer-controlled treatment by heated air. This produces a "linoleum-like" finish causing positive fixation or adhesion of the color pigment to the wood—truly permanent colors.

Available in Wide Variety of Sunfast Colors

The appearance of these new shingles actually improves with age, as their soft harmonious colorings are mellowed. Unaffected by acid or alkaline conditions, even when dipped into hot lime or plaster, they will not peel or crack. The colors will not change. They are truly non-fading.

Available in green, gray, brown, red or attractive combinations of any of these colors—also the incomparable new grays and prime white. Packed in bundles in correct proportions, ready for laying.

Covering Capacity

Edham Sunfast Shingles are supplied on the square basis (a square containing sufficient shingles to cover 100 sq. ft.) figured as follows:

Shingle length, in.	Exposed to weather, in.	Bundles to square	Courses
16	5	4	20/20
18	5½	4	18/18
18 (Process Shakes)	7½	3	18/18
24	10	3	13/14

Sizes and Styles

The Edham Kolored Sunfast Shingles can be obtained in a wide variety of sizes and styles, as follows:

Shingle	Size, in.	Butt, in.
XXX	16	6 to 2
XXXXX	16	5 to 2
Eureka	18	5 to 2
Perfection	18	5 to 2¼
Process Shake	18	9/20
Royal	24	½ and
Supreme	24	1
Process Shake	25	½
Hand Split Shake	25	½ to 1¼

Color and Planning Service

A service department is maintained to co-operate with architects, contractors and builders, color suggestions and layouts supplied without charge.

Architects' Sample Pad of Actual Shingles

A request on your letterhead brings a pad showing the full color range of Edham Kolored Sunfast Shingles.

Sidewalls of this Colonial Residence at Kansas City, Mo., are in Gray with a Green Shingle Roof of Edham Sunfast Shingles

THE ELHIDE COMPANY

JOHN C. RUNKLE, President

Makers of Elhide Hand-Split Cedar Shingles

CAMBRIDGE, MASS.

PLANT AT HATZIC, B. C.

NEW YORK OFFICE: 122 East 42nd Street

Products

ELHIDE HAND-SPLIT CEDAR SHINGLES.

For Elhide Hand-Split Cedar Fencing and Elhide Monson Maine Roofing Slate, see Manufacturers' Index.

Elhide Hand-Split Cedar Shingles

Elhide Hand-Split Cedar Shingles are rived by hand from the giant cedars of British Columbia, the source of the best red cedar. There the Elhide workmen cut the trees, split the shakes with maul, frow and wedge, and saw the shingles on one side only to effect a tight-laying undersurface.

Stock—Rotproof red cedar, air-dried and 100% edge (straight) grain, which effectually prevents warping, curling and consequent splitting. Free from knots, sap and other imperfections.

Sizes—25 and 31 ins. long. Random widths 4 to 12 ins. Graded to seven butt thicknesses, from ½ to 2 ins. (For table of sizes, see following page.)

Weight Per Square—From 200 lbs. on ½-in. butts to 700 lbs. on 2-in. butts. Note: Even the 2-in. butt shingles are light in weight compared with tile, slate, etc.; and do not require extra construction to support their weight on a roof.

Butts—The butt-line has a natural irregularity typical of a hand-made shingle but this characteristic unevenness is not artificially exaggerated.

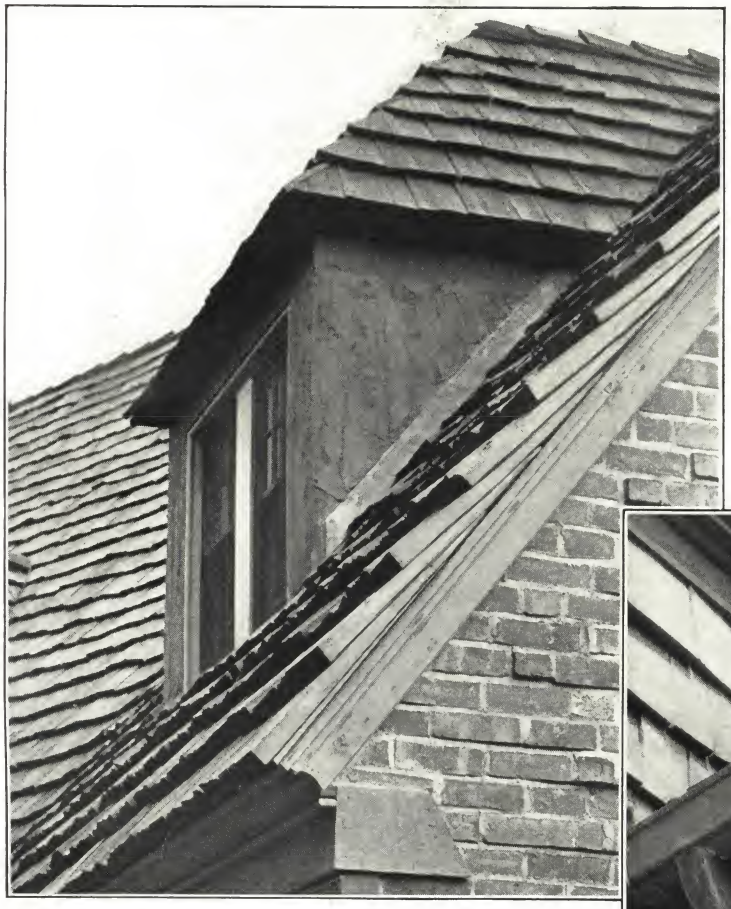
Durability—By comparative tests, British Columbia Red Cedar is rated as one of the most durable woods for exterior use. It contains preservative oils which prevent rot and decay. Straight-grained stock prevents warping and splitting after the shingles are applied. The exposed surface of an Elhide Hand Split Shingle is entirely unbroken hard-grain which resists the destructive effects of the weather.

Staining—Untreated Elhide Shingles weather to a delightfully mellow tone. They require no stain or paint to preserve them, but if color is desired, we are equipped to stain them any shade, including white primer or bleaching oil.

Application—To secure an authentic old-time effect, do not cut or trim the edges of Elhide Shingles. Lay each shingle vertically. Use at least two nails to each shingle, spaced about 2 ins. under the lap. Copper nails, or hot dipped, zinc-coated nails should be used to secure the full durability of these long-wearing shingles. The joints should be well broken, with at least a 2-in. side-lap. On roofs, a watertight layer of asphalt roofing felt,

Elhide Hand-Split Cedar Shingles

Patented March 23, 1926



Actual appearance of Elhide Hand-Split Cedar Shingles as applied on a sidewall. In this case, the shingles are 1 in. thick at the butt, laid at an exposure of 10 in. The beautiful and interesting texture of the split cedar, which varies on each shingle, and the characteristic shadow lines are clearly evidenced by this illustration.

weighing at least 30 lbs. per 100 sq. ft., should be laid under all hand-split shingles. (The uneven surface of Elhide Shingles allows sufficient ventilation to prevent dry rot or decay.) For a starter course, we suggest the use of ordinary sawed shingles.

Samples—Sample shingles and prices on any thickness will be furnished upon request. We shall also be pleased to suggest layouts and to refer to representative installations in your vicinity.

Condensed Specification

All roofs and sidewalls shall be covered with Elhide Hand-Split Cedar Shingles (100% straight-grain) ..... inch butts, exposed ..... inches to the weather, as made by The Elhide Company, 130 Sixth Street, Cambridge, Mass. (Write for complete specification.)

Above:

Graduated Roof of Elhide Hand-Split Cedar Shingles on a Residence, Wellesley, Mass.

Walker, Walker & Kingsbury, Architects, Boston, Mass.

The first four courses are 1¾ ins. thick, 31 ins. long, laid at a 10-in. exposure. Balance of roof is covered with shingles which gradually diminish in both thickness and exposure to ½-inch butts, laid 6 inches to the weather, at the ridge

At Right:

Cornice of Boathouse, Manhasset, L. I., N. Y.

LaFarge, Warren & Clark, Architects, New York, N. Y.

The roof is covered with Elhide Hand-Split Cedar Shingles graduated from 1¾-inch butts laid at a 10-inch exposure at the eaves, to ½-inch butts, 6 inches to the weather, at the ridge. Shingles 1 inch thick are used on the sidewalls.

Elhide Graduated Roofs

The conventional wood shingle roof is not only the most typically American roof, but because of obvious advantages and proved worth, has been adapted in some manner to almost every form of present-day architecture. Elhide Hand-split Cedar Shingles retain all the desirable qualities of light-weight, warmth and weathering beauty that are inherent in the wooden shingle and, in addition, provide a rugged, textured surface; also an unusual durability free from upkeep expense obtainable only in a shingle rived by hand, entirely straight-grained and air-dried.

Heretofore, designers have turned to slate slabs, ¾ or 1 inch thick, when laying out a graduated roof. It has remained for The Elhide Company to produce for this purpose massive hand-split wooden shingles up to two inches in thickness.

The architect is now afforded an opportunity to design a graduated roof of unsurpassed massiveness and strength and yet retain all the beauty and characteristic charm of the wooden shingle enhanced by the ruggedness and texture of the hand-split surface.

For example, a graduated roof may be laid out in accordance with the following schedule:

Beginning at the eaves:

4 courses,	2 in.	thick,	10 -in. exposure
4 courses,	1¾ in.	thick,	9½-in. exposure
4 courses,	1½ in.	thick,	9 -in. exposure
4 courses,	1¼ in.	thick,	8½-in. exposure
4 courses,	1 in.	thick,	8 -in. exposure
4 courses,	¾ in.	thick,	7½-in. exposure
Balance	½ in.	thick,	7 -in. exposure

Upon presentation of roof plans and elevations, we shall be pleased to draw up similar layouts of correct proportions. (See "Application" and "Specification" for additional information.)

STANDARD SIZES OF ELHIDE HAND-SPLIT CEDAR SHINGLES
(Special thicknesses and lengths made to order)

Three Typical Examples

The informal cottage (right) at Darien, Conn., is an excellent example of a well-laid sidewall of Elhide Hand-Split Cedar Shingles. The desired effect of age and weather-beaten exposure is achieved in part by the prominent joints that appear between some of the shingles but, of course, the characteristic texture of Elhide Shingles is in itself the greatest assistance in securing a properly seasoned appearance. In this instance, ½-in. butt shingles were laid at an exposure of 10 in.

Paul Revere House, the oldest building now standing in Boston, was built about the middle of the seventeenth century. It was restored in 1908, and is now roofed with Elhide Hand-Split Cedar Shingles with butts ½ in. thick. It is a typical example of the many restorations and reproductions of early American architecture for which Elhide Shingles have been selected.

Cottage in Darien, Conn.
DAVIS & WALLDORFF, Architects, New Haven, Conn.

Paul Revere House
JOSEPH EVERETT CHANDLER, Restoration Architect, Boston, Mass.

The houses of that early period were roofed and sometimes sided with shingles which were split by hand from cedar logs and of such length that exposures of 10 in. or more were the usual practice. It is because Elhide Hand-Split Cedar Shingles are of such length and general appearance when laid that they are so often specified to meet these authentic requirements.

The entire roof and all sidewalls of the country residence (lower right) on the shores of Lake Erie, near Buffalo, N. Y., are covered with Elhide Hand-Split Cedar Shingles, 1½ ins. thick at the butt. It is an illustration of the exceptional and completely individual effect it is possible to obtain by the use of the extraordinarily thick shingles made by THE ELHIDE COMPANY.

JAMES LUMBER COMPANY

ESTABLISHED 1875

88 Broad Street
BOSTON, MASS.

"BLUE JAY" HAND MADE CYPRESS SHINGLES

"Blue Jay" Shingles are hand split—rived with the grain—which preserves all the wonderful weather-resisting qualities of heartwood cypress, "The Wood Eternal." No single generation lives long enough to renew a hand split and shaved cypress roof that has been properly laid.

"Blue Jay" Cypress Shingles are made by exactly the same methods as were followed by the pioneers of South Carolina and their slaves, who as far back as 1640 did a thriving business in this line. Some of the roofs on which they were laid in those days are still in service today—weatherproof after nearly three centuries of exposure.

Today, descendants of those same slaves, working in the same southern swamps, are felling selected trees, cutting bolts and with frow, maul and drawshave, are making "Blue Jay" Shingles for American homes.

When split and tapered, they are piled loosely and left to season and to weather in the sun and air. Therefore, as delivered to the job, "Blue Jay" Shingles are already semi-weathered.

Further exposure to inland air deepens their wonderful soft brown tones, while along the shore they weather to a silver gray.

To the Colonial type of house, "Blue Jay" Shingles add years—both in appearance and weatherproofness. For other types, or wherever desired, they may be painted or stained.

All "Blue Jay" Shingles are carefully selected, graded and fully guaranteed.

Sizes—"Blue Jay" Cypress Shingles are made in the two sizes most favored in Colonial days and still considered best:

24 in., with 5/8-in. butts and 1/8-in. tops.
20 in., with 1/2-in. butts and 1/8-in. tops.

Samples gladly supplied on request.

Laying—For roofing, the 24-in. size should be laid 7 in. to the weather, and the 20-in. size 6 in. to the weather. For sidewalls, the 24-in. shingles may be placed 9 or even 10 in. to the weather. The 20-in. size should be laid 7 or 8 in. to the weather.

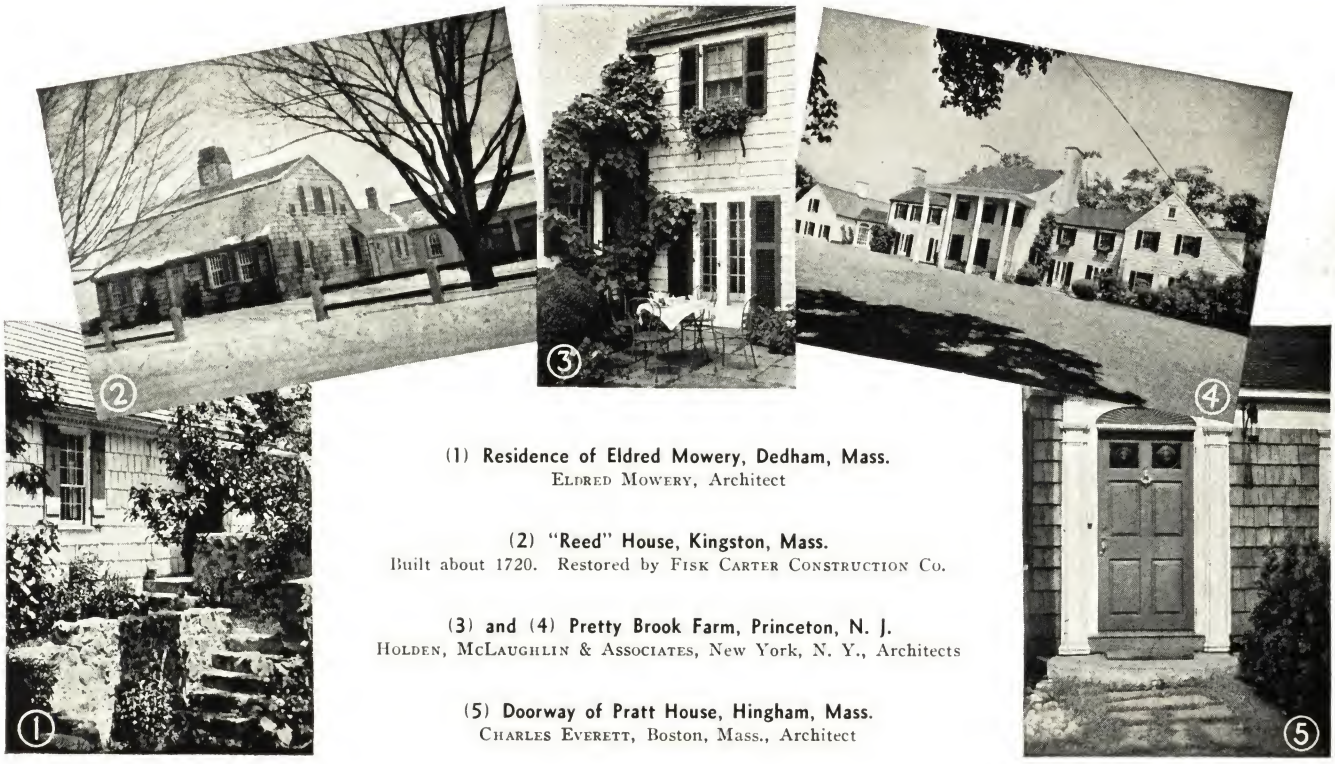
Nailing—Specify copper (1¾ to 2¼ in. in length), "yellow metal" or old-fashioned dipped galvanized nails, 5d or 6d according to exposure. The less the amount of shingle exposed to weather the longer the nail should be. On sidewalls, 4d nails may be used. Prices on nails will be quoted if desired.

Staining—Although "Blue Jay" Shingles never have that "new," "raw" look, and never actually require staining—either for appearance or preservative purposes—they may be whitened or colored with paint or any standard stain.

Prices—Prices for "Blue Jay" Shingles loaded on cars Boston, Mass., shipped from stock, are as shown below. Freight and carting additional. Freight to most New England stations will not exceed $1.00 per square; carting, not exceeding 10 miles, about $1.00 per square.

20-in. Shingles*

Laid 6 in. to weather $17.00 per 100 sq. ft. covered
Laid 7 in. to weather 14.50 per 100 sq. ft. covered
Laid 8 in. to weather 13.00 per 100 sq. ft. covered



24-in. Shingles*

Laid 7 in. to weather $20.75 per 100 sq. ft. covered
Laid 8 in. to weather 18.00 per 100 sq. ft. covered
Laid 9 in. to weather 16.00 per 100 sq. ft. covered
Laid 10 in. to weather 14.50 per 100 sq. ft. covered

*For recommended exposures, see paragraph "Laying," above.

Prices for points outside of New England furnished upon request, based on shipments made from nearest available stock. Ample supplies always on hand.

Specifying—To obtain the genuine article specify as follows: "For roof and sidewalls use genuine cypress, clear all heart, hand made, split and shaved shingles, 'Blue Jay Brand,' supplied by JAMES LUMBER COMPANY, 88 Broad Street, Boston, Mass."

WEATHERBEST STAINED SHINGLE COMPANY, INC.

Manufacturers of Weatherbest Red Cedar Stained Shingles

NORTH TONAWANDA, N. Y.

FACTORIES: NORTH TONAWANDA, N. Y., ST. PAUL, MINN., CLEVELAND, OHIO

Products

WEATHERBEST EDGE GRAIN RED CEDAR STAINED SHINGLES for roofs and sidewalls; WEATHERBEST 24-in. COLONIAL WHITE STAINED SHINGLES; WEATHERBEST THATCHED EFFECT STAINED SHINGLES; WEATHERBEST "DOUBL-THIK" STAINED SHINGLES, WEATHERBEST OLD COLONY HAND RIVED SHAKES; WEATHERBEST BRUSH COAT SHINGLE STAINS.

Used on Roofs and Sidewalls

WEATHERBEST stained shingles are used on sidewalls as well as roofs and are adaptable to practically every type and style of building—from the small cottage or bungalow to the stately country home. The soft, semi-transparent colors add much to the attractiveness of a home. WEATHERBEST stain emphasizes the grain in the wood just enough so that the flat tone of a painted shingle or surface is absent.

Reliability

There is twenty years' experience behind this rigorous WEATHERBEST policy: *"Not to cheapen materials or process to meet price competition."*

Each bundle of WEATHERBEST stained shingles is protected with WEATHERBEST "Visibl-Pak" covers and carries the green WEATHERBEST label and is our guarantee of perfect material and lasting colors.

Quality of Weatherbest Shingles

Only the finest grade of all clear, strictly 100% edge (vertical) grain, red cedar is used in the manufacture of WEATHERBEST stained shingles. Every shingle is perfect from tip to butt. Extreme care is exercised that all shingles are entirely free from any trace of dampness before being subjected to the WEATHERBEST process of staining.

Quality of Weatherbest Stain and Staining Process

WEATHERBEST stain consists of the strongest color pigments obtainable, high grade wood creosote preservatives and pure linseed oil as binder. These ingredients are mixed in our factories by our color and oil experts in the correct proportion to insure colors that are rich and soft in tone, and, above all—*durable*.

All shingles are unbundled at our factories and stained separately—not bundle-dipt as is the case with many other stained shingles. The WEATHERBEST process treats each shingle thoroughly and perfectly. Three shingle-by-shingle inspections occur during the WEATHERBEST process of staining.

Weatherbest Sizes, Colors and Covering Capacity

WEATHERBEST stained shingles are furnished in the following sizes:

16 in. WEATHERBEST XXXXX	5 butts to 2 in.
16 in. WEATHERBEST "Doubl-Thik"	5 butts to 3½ in.
18 in. WEATHERBEST Eurekas	5 butts to 2 in.
18 in. WEATHERBEST Perfections	5 butts to 2¼ in.
24 in. WEATHERBEST No. 1 Royals	½ in. butts
24 in. WEATHERBEST "Doubl-Thik"	1 in. butts

Note: See second following page for sizes of Weatherbest Old Colony Shakes and Weatherbest 25-in. Resawn Cedar Shakes.

WEATHERBEST colors consist of 40 different shades of greens, browns, reds and grays. WEATHERBEST stained shingles are also furnished in a color combination similar to weathered straw for WEATHERBEST thatched effect roofs, and in many variegated and blended color schemes. Special colors are also furnished without extra charge. Color samples on request.

NUMBER OF SQUARE FEET A SQUARE OF WEATHERBEST WILL COVER AT VARIOUS EXPOSURES

A Weatherbest Home at Spring Lake, Mich.

ALEX MCCOLL, Architect

On this charming home the architect specified a WEATHERBEST variegated green roof and sidewalls of 24-in Heavy Butt WEATHERBEST in Prime White

Weatherbest Variegated Color Roofs

WEATHERBEST stained shingles in several shades of one color, or different colors, may be used on roofs with decidedly pleasing results. For this purpose, there are standard WEATHERBEST variegated color schemes in browns, greens, reds, grays, etc., worked out to just the correct proportion of colors. No extra labor is required to lay, as the different colored shingles are mixed and then rebundled at our factories so that the carpenter lays them as received. Ask for panels in miniature showing variegated colors.

Roof Detail of Home of Albert Tilt, Jr., Round Hill, Greenwich, Conn.
TREANOR & FATIO, Architects
WEATHERBEST 18-in Perfection Stained Shingles in a special blend of dark brown to red. Shingles laid extremely irregular with doubling of courses at some sections. Specifications on request. H. C. Atwater, Inc., Contractor. Photo—Studio of Harold Haliday Costain, Scarsdale, N. Y.

Weatherbest Blended Color Roofs

Another roof treatment developed by WEATHERBEST is the blended color roof. This consists usually of four to seven shades blending from dark to light of any particular color or even blending from one color to another. WEATHERBEST blend roofs are prepared in our factory and the shingles properly proportioned and packed ready for laying in proper order so that no extra labor is required. So carefully are the various shades blended that the eye cannot detect where the actual changes occur. Where WEATHERBEST blend roofs are desired blue prints should be sent to our Service Department in order that the proper proportions of each color can be worked out and the prints marked for proper laying.

Ask for panels in miniature showing variegated color and blended roofs.

There are many ways WEATHERBEST can be laid on roofs to give unusual effects. Our Architects' Service Department will gladly suggest effects and furnish laying specifications.

24-in. Weatherbest Colonial White Shingles

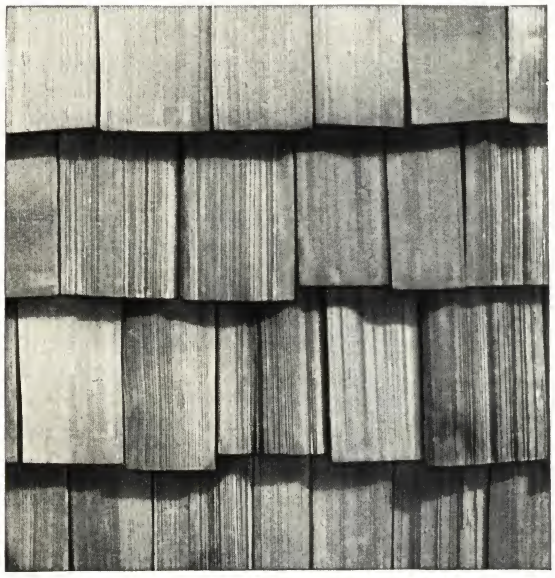
The large 24-in. heavy butt, WEATHERBEST Colonial white stained shingles are used extensively on sidewalls for the wide course effect. The pure, non-glaring white of WEATHERBEST Colonial white stain combines to make a sidewall that is far more attractive than the monotonous white of a painted clapboard siding. WEATHERBEST Colonial white stained shingles are first treated at our factories with a filler coat of our No. 500 white preserving stain. After they are laid on the sidewalls, the shingles should then receive two light brush coats of WEATHERBEST Colonial white stain to produce the true white-washed effect. Send for literature on Colonial white.

Weatherbest Thatched Straw Effect Roofs

Combining attractiveness with long life, a WEATHERBEST thatched effect stained shingle roof offers the means of a radical but artistic departure from the conventional sharp angle roof.

WEATHERBEST thatched stained shingles are furnished ready for application. They come bent with the grain (lengthwise) to a 20-in. radius for the rounded surface of hips and valleys and for capping the ridges; bent with the grain to a 10-in. radius for the curves or roll at rakes; bent to a 20-inch radius against the grain (crosswise) for the curve at eaves and rounding of ridges, and flat for the flat surfaces of the roofs. Butts are specially sawn so that when laid, irregular, wavy courses will result. Furnished in any color desired.

Full information and standard specifications for constructing a WEATHERBEST thatched effect stained shingle roof is given in our book, "The Construction of WEATHERBEST Thatch Roofs," which is furnished on request.



When thatched effect roofs are specified we ask that a set of plans be sent to us in order that we may estimate the quantities required of the different shingles.

William Sparks Residence, Jackson, Mich.
CLAIRE ALLEN & SONS, Architects
For the roof, WEATHERBEST Thatch in Variegated Green; for the walls, 24-in. WEATHERBEST finished in WEATHERBEST Colonial White

Weatherbest Old Colony Hand Rived Shakes

WEATHERBEST Old Colony shakes are split and tapered by hand in much the same manner as those made by our forefathers in the East from pine and white cedar; in the South from cypress, and on the Western Coast from red cedar. The lasting qualities of these old-time hand split shakes are well known.

Weatherbest Old Colony Shakes

Hand splitting of WEATHERBEST Old Colony red cedar shakes results in a very uneven surface and the grain is perfectly straight. It gives them an artistic unevenness that imparts an old-time atmosphere to a roof or sidewall. But at the same time, WEATHERBEST Old Colony shakes conform with specified measurements in order to meet the more rigid requirements of modern-day architecture. They are available in lengths of 18, 25, 31 and 37 in., the latter allowing a maximum exposure of 18 in. on sidewalls and 12 in. on roofs.

WEATHERBEST shakes are stained any color desired. We suggest that sidewalls be in WEATHERBEST weathered gray or a silver gray color, and for roofs, either a WEATHERBEST variegated brown or weathered gray. We will be only too glad to send full size samples of shakes stained any color desired.

To those desiring the quaintness characteristic of early America, we unhesitatingly recommend these genuine WEATHERBEST Old Colony hand rived shakes for roofs and sidewalls.

Following is a brief description of the different sized Old Colony Shakes. Full information and illustrations of their use on various types of homes is contained in a book gladly sent on request.

The 8-in. Length—Random Widths. Thickness at butts is from ⅜ to ½ in. allowing slight variations over or under in a small proportion. One square laid on sidewalls at standard 8½ in. exposure covers 100 sq. ft. At 5 in. standard exposure on roof one square will cover 67 sq. ft.

The 25-in. Length—Random Widths. Thickness at butts is from ⅜ to ⅝ in. allowing slight variations over or under in a small proportion. One square laid on sidewalls at standard 12 in. exposure covers 100 sq. ft. At 8 in. standard exposure on roof one square will cover 66 sq. ft.

The 31-in. Length—Random Widths. Thickness at butts is from ¾ to 1 in. allowing slight variations over or under in a small proportion. One square laid on sidewalls at standard 15 in. exposure covers 100 sq. ft. At 10 in. standard roof exposure one square covers 68 sq. ft.

The 37-in. Length—Random Widths. Thickness at butts is from ¾ to 1¼ in. allowing slight variations over or under in a small proportion. One square laid on sidewalls at standard 18 in. exposure covers 100 sq. ft. At 12 in. standard roof exposure one square covers 66 sq. ft.

Weatherbest 25-in. Resawn Cedar Shakes

These shakes are rough and uneven on the one side and smooth sawn on the other. They are of random widths but not all edge grain as are Weatherbest Old Colony Shakes. The length runs from 24 to 26 in. and thickness at butts is from ⅝ to 1¼ in. with an average of ⅞ in. Laid on sidewalls at standard 10-in. exposure one square covers 100 sq. ft. At 7½-in. standard roof exposure one square covers 76 sq. ft. Samples of these and Old Colony Shakes gladly sent on request.

Standard Specifications for Weatherbest Old Colony Sidewalls and Roofs

For Sidewalls—WEATHERBEST Old Colony Genuine Hand Rived Tapered Red Cedar Shakes stained (insert size and color) laid to (insert inches) weather exposure and applied with zinc coated nails over sheathing and building paper.

For Roofs—WEATHERBEST Old Colony Genuine Hand Rived Tapered Red Cedar Shakes stained (insert color and size or variegation) laid to (insert inches) weather exposure and applied with zinc coated nails over tight sheathing and slaters' felt.

Weatherbest Standard Specifications

To guard against substitution of inferior material, we advise incorporating the following in specifications:

Shingles: To be (insert size and color and inches exposure to the weather) WEATHERBEST, all clear, all edge grain stained shingles, as manufactured by WEATHERBEST STAINED SHINGLE COMPANY, INC., of North Tonawanda, N. Y., and St. Paul, Minn.

Frederick E. Weyerhaeuser Residence, Manitou Island, White Bear Lake, Minn.

EDWIN H. LUNDIE, Architect

Nearly a carload of 25-in. WEATHERBEST Old Colony Shakes used for the sidewalls.

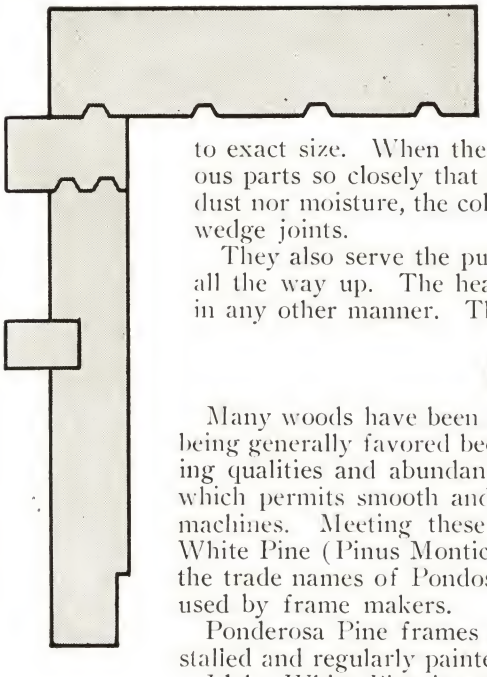
PINE CRAFT
Weather Proof
FRAMES

"THE FRAMES WITH THE WEDGE JOINTS"

CATALOG NO. 7-A • 1931 - 32

WHITE PINE SASH COMPANY
SPOKANE, WASHINGTON

PINE CRAFT WEATHER-PROOF FRAMES



Stock Frames in Varying Details for Use from Coast to Coast

Pine Craft Weather-Proof Frames are a product of the White Pine Sash Company, Spokane, Washington, one of the country's largest producers of pine sash and frames. Much time was spent and many experiments were made in developing the weather-proof features, which are explained below.

The fact that this construction (originated by Pine Craft) has been widely imitated by other manufacturers testifies to the merit of the idea.

The Pine Craft trade mark is registered in the United States Patent Office. This trade mark is represented by a distinctive label, a copy of which appears on the back cover of this catalogue. One of these labels is affixed to each frame bundle.

Pine Craft Weather-Proof Frames are made in a variety of styles and sizes for all manner of construction and to suit the peculiar needs of the territory where used. In addition to the stock patterns shown herein and which are generally used for the sake of service and economy, we are equipped to manufacture frames to architects' details, where special treatment of the window openings is desired.

Wedge Joint Construction

The adjoining half size cut shows a cross section of a Pine Craft Weather-Proof Frame. The various members are united by wedge-shaped tongues and grooves, milled to exact size. When the frame is nailed up, these tongues and grooves unite the various parts so closely that they present to the elements a front of solid wood. Neither dust nor moisture, the cold blasts of winter, nor the hot winds of summer can pass the wedge joints.

They also serve the purpose of lining up the casings. The side casings are parallel, all the way up. The head casing is parallel with the sill. They cannot be assembled in any other manner. The result is that storm sash and screens fit perfectly.

Materials Used

Many woods have been used for the building of frames, the soft pines being generally favored because of their weather resisting and paint holding qualities and abundant supply. They are also extremely workable, which permits smooth and accurate machining to pattern on high speed machines. Meeting these requirements to a surpassing degree, Idaho White Pine (Pinus Monticola) and Ponderosa Pine, formerly sold under the trade names of Pondosa Pine and California White Pine, are widely used by frame makers.

Ponderosa Pine frames are moderately priced, and when properly installed and regularly painted, will give a lifetime of faithful service.

Idaho White Pine is one of the few genuine white pines available in commercial quantities. Frames made of this wood are slightly higher in price than Ponderosa Pine frames, but will withstand neglect to a remarkable degree and with reasonable care will outlast the useful life of any building in which they may be installed.

Pine Craft employs both species in the manufacture of frames, and furnishes frames of 100% Idaho White Pine, 100% Ponderosa Pine, or any combination of the two species, local preference being the determining factor.

Oak door sills are made from carefully selected oak sill stock, thoroughly air dried. The sawn ends are primed with linseed oil to prevent checking.

WHITE PINE SASH COMPANY

SPOKANE, WASHINGTON

CONSTRUCTION DETAILS

Sash opening sizes vary in different parts of the country (see "Window Opening Sizes" below). Pine Craft frames are made the proper opening size for the locality where sold. The standard width of sash run is $1\frac{13}{32}$ in. for $1\frac{3}{8}$-in. sash and $1\frac{25}{32}$ in. for $1\frac{3}{4}$-in. sash. Window frame sills are pitched $2\frac{1}{4}$ in. to 1 ft., providing perfect drainage and yet not so steep that stock sizes of storm sash and screens cannot be used. Door sills are pitched $1\frac{1}{4}$ in. to 1 ft.

Most frames are shown with $4\frac{1}{2}$-in. casings, but any Pine Craft dealer can furnish these in narrower widths if desired.

PULLEYS

Pine Craft frames are fitted with Dillon Jam-Proof Pulleys or Grand Rapids Pulley No. 18, both with everlasting bronze bearings, and both can be furnished in either lacquer or galvanized finish.

Pulleys with special face plates can be furnished where required.

For Dillon Jam-Proof Pulleys as made by Stanley Works, see Manufacturers' Index.

GRADES

Pine Craft frames are furnished in two grades. "Clear" grade frames have all exposed faces clear. "No. 1" grade frames may have pulley stiles and sills containing sound knots, not over $1\frac{1}{2}$ in. in diameter. Other parts are practically the same as furnished in Clear grade frames. Clear grade frames may be identified by black and gold labels, No. 1 grade frames by blue and white labels.

LOCALITY USES

Custom and usage have decreed that certain types of frames shall be used in certain territories. Pine Craft recognize this fact and Pine Craft dealers carry the proper types of frames for the territory they serve. These territories are quite well defined and for convenience are set forth below, together with frame patterns most commonly used.

	Cellar frames	Frame house		Brick veneer		Brick wall	
		Window frames	Door frames	Window frames	Door frames	Window frames	Door frames
New York City area and northern New Jersey...	776	702-703 711	750-751 756	726	762	730 736	765
Boston area.....	772	719	752-A				
Western Masachusetts and northern Connecticut...	772	709	752	726	762	730 736	765
Central and western New York	771	701-711	750-756	725	761	730 736	765

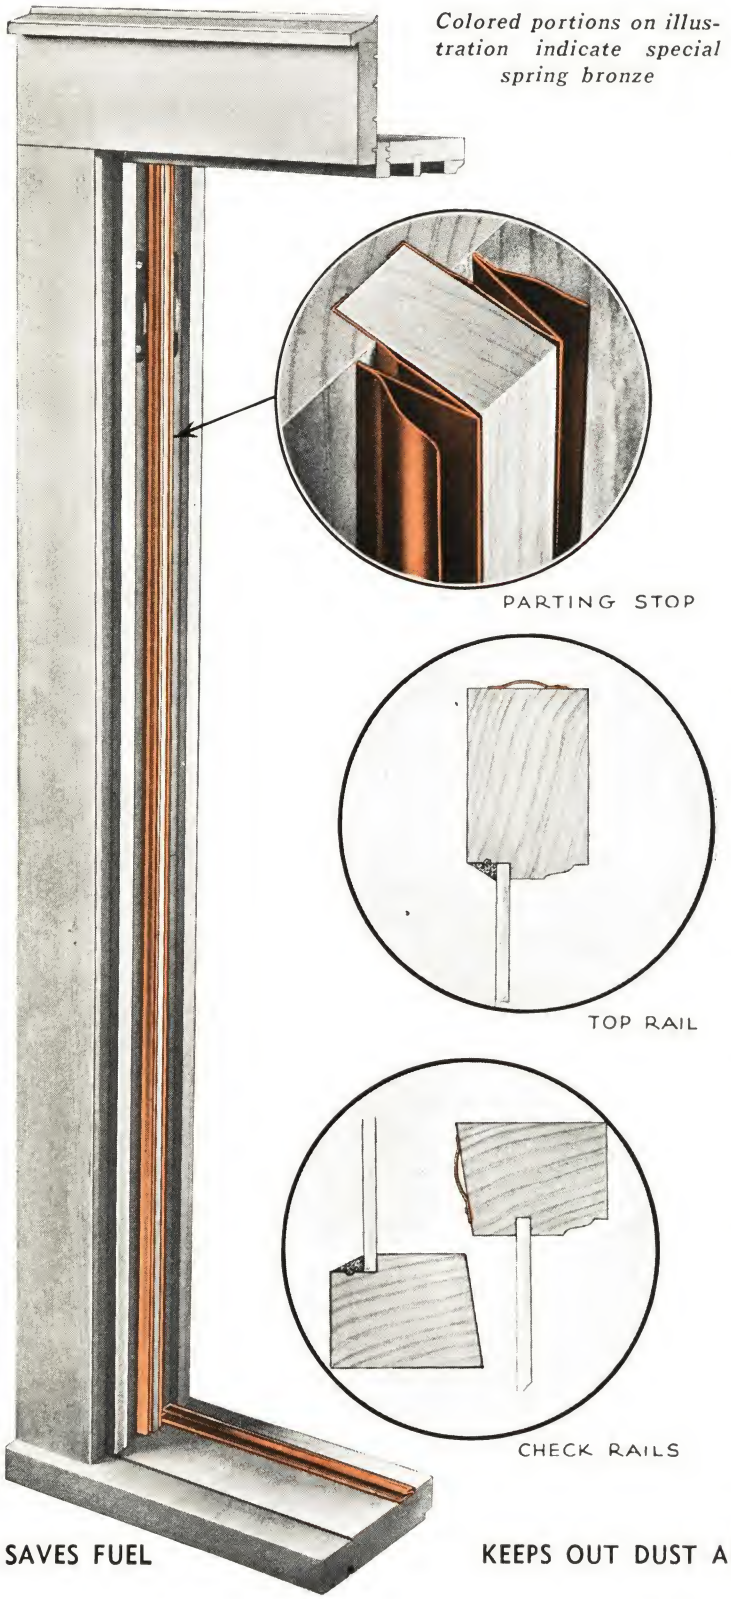
St. Louis and southwest..	771 772	700-701 720	750-752	726	762	732	765
See pages.....	12	4-6	7-8	9	9	10	11

Casement frames are not shown in the above schedule, as their use is relatively small. They are, however, shown in this catalogue under the numbers 740-743-745-746. Casement Frame No. 740 is in general use in all territories. Nos. 743-745 and 746 are used in the Philadelphia territory. See page 6.



There is more or less over-lapping of the territories shown, and this schedule should be used only as a general guide. Other territories are not quite so well defined, but some patterns of frames shown herein are considered proper for use in all important building centers.

WINDOW OPENING SIZES

		Add to glass size Width	Height
Boston area	Boston openings	3⅝-in.	5-in.
New York and northern New Jersey	New York openings	4 -in.	6-in.

Michigan, Illinois and West, 2-Lt. windows	Western openings	4 -in.	6-in.
Indianapolis market openings		5 -in.	6½-in.
Baltimore and Washington, D. C., market openings		4½-in.	6¼-in.

PINE CRAFT WEATHER-PROOF FRAMES COMPLETELY WEATHERSTRIPPED

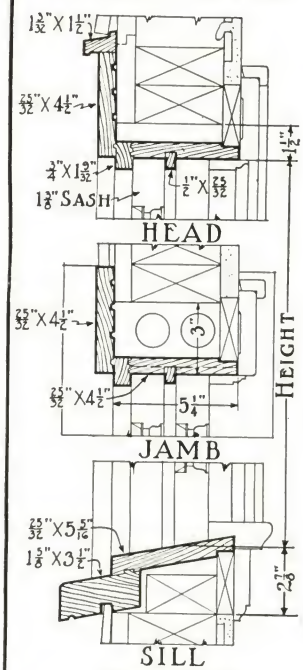
For Frame, Brick Veneer or Masonry Construction

Colored portions on illustration indicate special spring bronze

Weather-Proof and Weatherstripped — To the weather-proof features of the Pine Craft Frame has been added the necessary complement — a weatherstripped opening. Pine Craft Frames are made weather-proof by Wedge Joint Construction and now the sash openings are sealed by the use of special spring bronze weatherstrips. The side weatherstrip attaches to the parting stops, the "S" shaped fold making double contact with the sash (see illustration at left). A strip of similar design is attached to the sill, the bottom rail of the sash resting thereon. Between the check or meeting rails is used a single curved strip, which does not interfere with locking the window. The same style is also attached to the top of the top rail, completing the assembly and assuring practically an *air tight window*. These weatherstrips also end the annoyance of rattling windows.

Where Used — Residences, apartments, office buildings, hospitals and all heated buildings having double hung windows.

Advantages—Pine Craft Weatherstrip seals *all* the crack around the window; top, bottom and center as well as at the sides. In the average residence the length of crack around double hung windows is approximately seventeen feet, of which about 60% is at the sides and about 40% at the top, bottom and center. Obviously, if only the sides of the sash are weatherstripped almost half of the total crack is left open to the elements. Pine Craft Weatherstrip seals *all* the crack more efficiently.



The side weatherstrip extends a full half inch from the face of the pulley stile and because of the "S" shaped fold, forms double contact with the sash instead of only single contact as with most metal weatherstrips. The flexibility of this strip compensates for any swelling, shrinkage or warping of the sash and allows them to run smoothly.

How Furnished—Pine Craft Weatherstripped Frames are furnished with the side strips attached to the parting stops and the horizontal strips included in the frame bundle. If Pine Craft Fitted Sash are ordered with the frames they are furnished already fitted for the frame, with bottom rail bevelled and the top rail, check rail and bottom rail weatherstrips attached. The bottom rail weatherstrip may be attached to the sill as shown in the illustration if desired, but the preferred method is to attach this strip to the bottom rail.

PINE CRAFT WEATHER-PROOF FRAMES
WOOD FRAME CONSTRUCTION

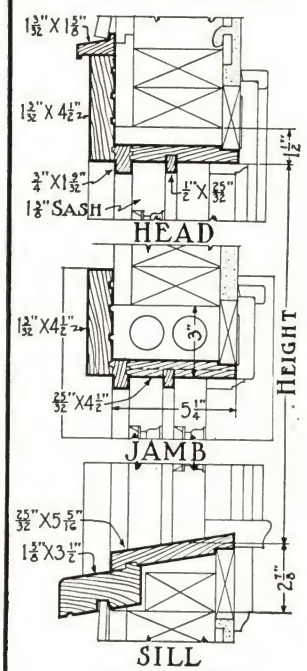
FRAME NO. 700.

SCALE: 1½"=1'-0"

WINDOW FRAMES

Frame No. 700 is in general use throughout the southwest. No. 701 is used largely in middle New York State and in the midwest. No. 702 and No. 703 are favorites in the New York metropolitan district and in northern New Jersey. Frame No. 707 is used mostly in Michigan, while No. 709 is preferred in western Massachusetts, northern Connecticut and the central northwest. Mullion centers are shown on page 8. All of these frames can be furnished equipped with the Pine Craft Weatherstrip shown on the opposite page.

Stock Sizes



Widths—Every 2 in. from 12-in. to 48-in. glass size inclusive, and in addition 21-in. and 27-in.

Heights—Every 2 in. from 12-in. to 48-in. glass size inclusive, and in addition 15-in., 19-in., 21-in., 27-in. and 31-in.

To determine window opening size add for wood allowance as indicated on page 2.

ANDERSEN FRAME CORPORATION

BAYPORT, MINNESOTA

Products

ANDERSEN FRAMES made of Wood for all types of Windows and Doors in any kind of construction or style of architecture.

ANDERSEN WEATHERSTRIPS for all Andersen Frames.

For Andersen Noiseless Sash Pulleys, see Andersen Foundry Co. in Manufacturers' Index.

Materials Used in Andersen Frames

When so specified, clear Genuine White Pine with a minimum of sapwood is used for all parts. This wood has been known to stand exposed to the weather for centuries without protection. Such durability, combined with even texture and the ease with which this wood takes and holds paint, makes Genuine White Pine a perfect wood for window and door frames.

Andersen Frames are also made of Pondosa Pine, with all important joints primed with aluminum paint. The same construction features and extra protection of aluminum paint make it possible to guarantee the same permanent satisfaction with either frame. Specifications for Andersen Frames should specify either Genuine White Pine or Pondosa Pine.

Andersen Noiseless, Wearproof Sash Pulleys are furnished installed in all frames for double hung windows. For detailed description of this patented pulley, see Andersen Foundry Co. in Manufacturers' Index.

Andersen Manufacture

These frames are completely manufactured in the world's largest and most modern frame plant. More than 27 years of experience in specializing in frame manufacture and standard methods of production result in a product that is far superior to frames made to special details in the small local shop. Quantity production of standard designs also means that these better frames can be furnished at considerably lower prices than special frames. Smooth milling and absolute accuracy in cross milling on high speed machines are standard requirements for Andersen Frames. This accuracy and the reinforced construction permit a great saving of labor time in fitting windows and inside trim to the frames. It is not necessary to do an individual job of measuring and cutting on each window or sash, nor is it necessary to cut each set of trim to fit one special frame. The windows and trim can be fitted to standard dimensions and any window or set of trim will fit any frame of the same size.

Construction of Andersen Frames

There is an Andersen Frame for every opening in any wall. There are frames for basement sash, double hung windows, casement sash, stationary sash and doors. Each of these types can be had in a special design for your particular construction whatever it may be.

Incorporated in these various frame designs are many exclusive construction features which make leakproof joints and provide a tight joining between the frame and the wall. The most outstanding feature is the locked sill-joint on all double hung window frames for frame wall construction and all casement sash frames. This new joint permanently locks the sill and jambs together and prevents leakage of water. It is a combination of sill dadoed and jamb dadoed construction with none of the disadvantages of either. It eliminates the necessity of blocking under the sill as the jamb lugs automatically support the sill. The locked sill-joint cannot be racked or opened up. (Pat. R.E. 17,552.) Other important features in this frame line are the 3 in. to the foot sill slope on all frames. Architects have long specified this as the standard, realizing that it makes a much better job than the sill with less slope. For complete drainage, so that no dirt nor water can lodge to start decay, the blind stops are chamfered at their lower ends. All frames for masonry construction have multiple mortar clinch grooves. Tests conducted by the University of Wisconsin showed that this reduces air infiltration 42% between the frame and the masonry.

Andersen Frame wall frames have provision for wide blind stops. These can be easily applied in the dealer's shop or on the job. By installing the frames in this way 54 per cent of the air leakage around the frame is stopped according to other tests by the Wisconsin laboratories.

Space does not permit showing our full size details in this catalogue but we shall be pleased to send you complete tracing details and full descriptions of Andersen frames. Architects have found these to be of considerable value and assistance.

Frame Sizes

Andersen Frames are made to receive all standard sizes of windows, sash and doors. Double hung window frames are made to receive either 1⅜ or 1¾-in. windows. Door and casement frames can be furnished with either 1⅜ or 1¾-in. rabbets.

Weatherstripping

There are Andersen Weatherstrips made of special spring phosphor bronze to fit all Andersen Frames. The weatherstripping for double hung windows is inexpensive; requires no labor for installation, no nailing, routing, rabbeting or inconvenience; and it is remarkably effective in reducing air leakage. You can also obtain weatherstrips for door and casement frames which can be applied at the factory or on the job at very little expense. We have laboratory tests on this product for your information—we will be glad to send you copies.

Distribution

All Andersen products are distributed through wholesale jobbers throughout the country who carry adequate stocks at all times. Any building material dealer can furnish Andersen Frames and Andersen Weatherstrips either from his own stock or by drawing upon his jobbers.

Service

The ANDERSEN FRAME CORPORATION puts an unqualified guarantee on all products.

We also maintain an Architectural Service Department equipped to adapt our standard frame designs to any wall construction. This service is free and we shall be glad to have you send us your requirements or we can have our representative call upon you to help you in laying out the best window arrangement for your building.

For further information and large size tracing details address ANDERSEN FRAME CORPORATION—Department S, Bayport, Minnesota.

F. W. STEVENS & SON, INC.

Manufacturers of Unit Casement Windows

70 Needham Street, NEWTON HIGHLANDS, MASS.

Products

STEVENS UNIT CASEMENT WINDOWS and SCREENS. Patented in United States of America and Canada.

Unit Casement Windows

Advantages—A completely assembled product including frames, sash, glass, screens, weatherstrips. Suitable for all kinds of construction, and architect's details. Guaranteed to be weathertight. Complete control of ventilation without direct drafts. Our ventilated transom window is especially suited for schoolhouses and hospitals. Transoms operated without disturbing screens or shades, or may be fixed.

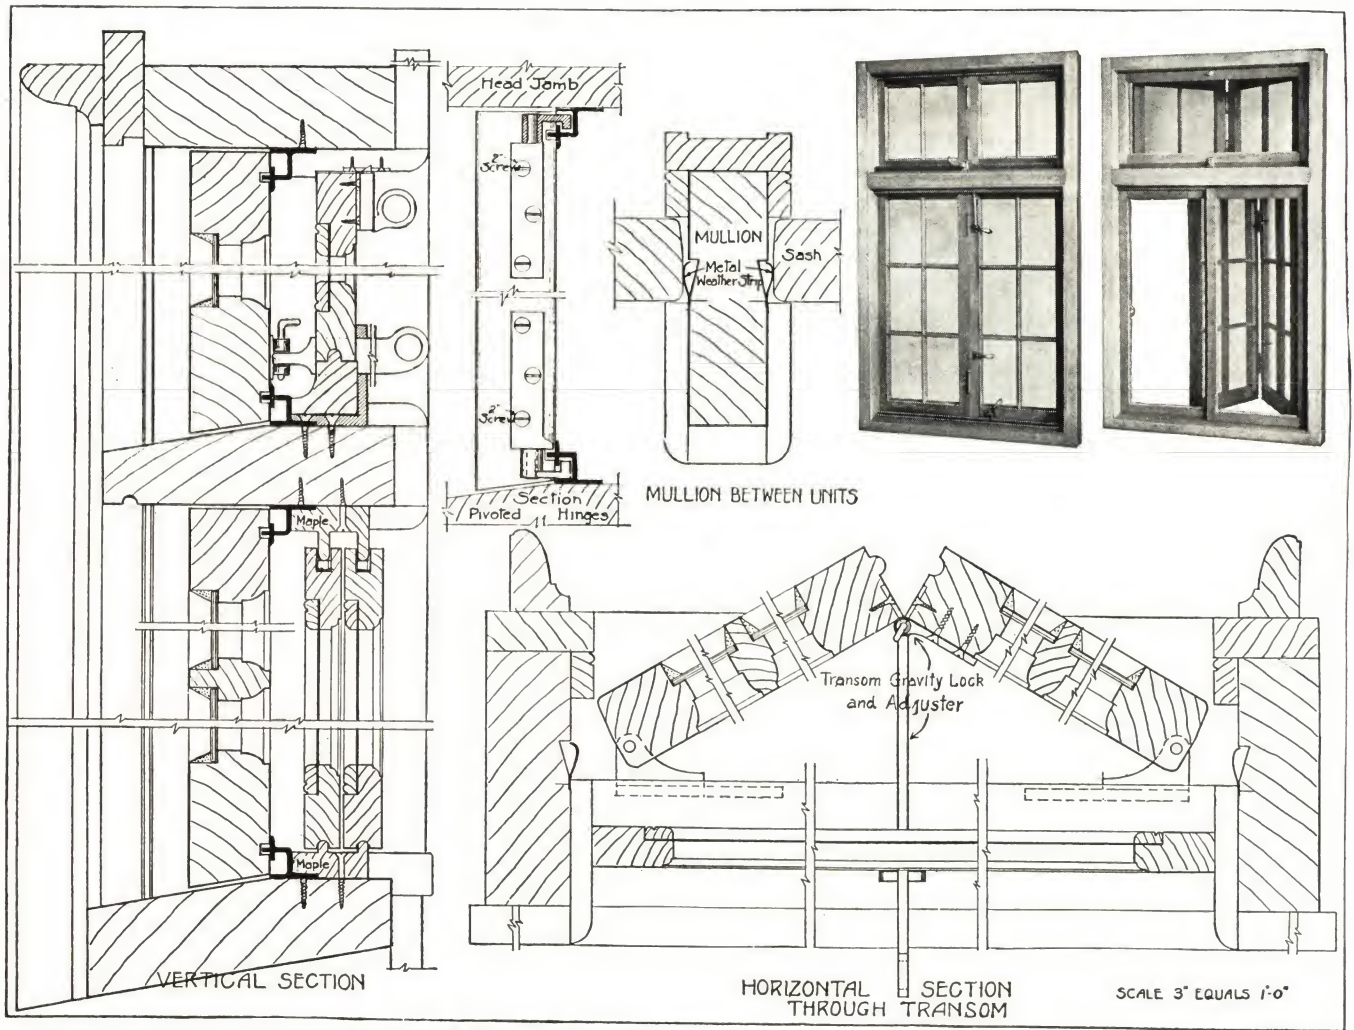
Ease with which windows can be cleaned on the outside from within—thus eliminating danger in cleaning.

Simplicity of construction. May be installed in old frames without disturbing interior or exterior finish.

Materials—***Frames***—Either for brick or wood construction from good seasoned white pine made to our standard or architect's details.

Sash—1¾ in. thick from best white pine.

Glass—Selected quality in the varying thicknesses. Glazed with the best glazing compound.



Screens—Made from best of rift sawed white pine, wired with 16-mesh dark copper screen cloth.

Hardware—All solid brass to our special detail, and completely fitted to sash. Special finishes of hardware may be furnished.

Installation—Windows are delivered at the building assembled, and carpenter has only to set units in openings designated on the plans. This completes the job in so far as the operation of sash and screens is concerned.

We do not furnish interior trim. For frame construction make rough openings 5 in. wider and higher than size of sash to be used.

Operation of Sash—A slight outward push in the center of each pair of sash will make the units fold together; they can then be slid to either side, or they may be placed in any position so as to give as little ventilation as desired. For single sash or groups of three,

Details of Stevens Unit Casement Windows with Transom

the odd single sash opens similar to the units, except that one of the pivoted corner hinges is replaced by an arm, one end of which is secured to sash, other being fastened to jamb, allowing sash to remain rigid in outswung position.

Note: Sashes may be glazed with "Vitaglass," the health-giving window glass, which transmits the curative ultra-violet rays of daylight.

Further information and full sized details for either brick or wood construction furnished upon request.

Hardware for Stevens Unit Casement Windows

The extruded brass track (Fig. 1) is screwed to stool and head jamb the entire width of each opening; the horizontal projecting tongue of track acts as a weatherstrip, fitting into a groove in the sash. The pivoted hinges (Fig. 2) are of cast brass; each hinge slides in extruded track from which it is impossible to become disengaged. Commercial spring bronze weatherstrips are furnished full length for each pair of jambs. Butts are 3x2 in. and are solid wrought brass; two or more being required for each pair of sash, depending on height of sash. The polished cast brass handle and lock (Fig. 3) is used as a lock, a slight turn securely fastening the sash. Polished cast brass top lock for use on high sash (Fig. 4); one lock required for each pair of sash. Transom gravity lock and adjuster for operating transom only (Fig. 5). Loose pin butt (Fig. 6). Handle to open and close the window (Fig. 7).

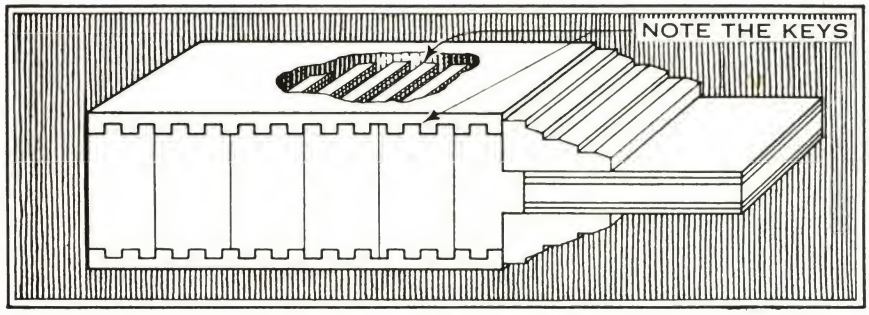
COMPOUND KEY-VENEERED WOOD DOORS

Guarantee



Full and complete without reservations. Covers defects in material and workmanship.

Construction

Stiles and rails have 7/8-in. core strips of chestnut or white pine cut from air dried lumber and thoroughly kiln dried. No scraps or refuse blocks used in cores.

Heavy sawed veneers applied in this way practically eliminate veneer trouble. Doors outlast the building.

Finishing Department—A very complete and adequate finishing department is maintained for the purpose of applying whatever part of the finish is desired by the customer. It is frequently a great convenience to have stain and filler, or even a complete finish applied before shipment is made.

Key-Veneered Construction

Showing method of applying veneers by tongue and groove process which gives twice the gluing contact of the ordinary method of applying the veneers flat and locks the structure in an inseparable bond

Veneers are sawed 1/4-in. thick, tongued and grooved to the core and rolled on under pressure by special patented process.

All panels are five-ply with face veneers either sawed, rotary cut or sliced, as the architect may specify.

Panel cores are all thoroughly re-dried, with face veneers ironed flat and re-dried in plate driers.

All wood stock goes into work dried within three to four percent of moisture and continues through a mill where atmospheric moisture is kept to a minimum.

Advantages of Construction—Glue surface between core and veneer is double that of any other veneer construction. (See illustration for core and veneer contact.) The shearing strain that is bound to occur between hardwood veneer and softwood core is overcome by this construction.

Strains and stresses are further neutralized by reversing the grain in core strips. All surplus glue and all air pockets are *rolled out* and are absolutely eliminated with this process.

Specifications Key-Veneered Panel Doors

All interior stile and rail doors shall have stile and rail cores built up of strips of softwood not thicker than 7/8-in., glued together under pressure, with 3/4-in. edge strips of same wood as face veneer. All stile and rail veneers shall be sawed 1/4-in. thick to finish $\frac{3}{16}$-in. thick, and shall be tongued and grooved to the core with at least four tongues and four grooves to the inch and glued with best grade of glue. Tongues and grooves shall be cut not less than $\frac{1}{16}$-in. deep.

All panels shall be laminated five-ply with grain crossed on alternate plies. All stile and rail joints to be mortise and tenon construction.

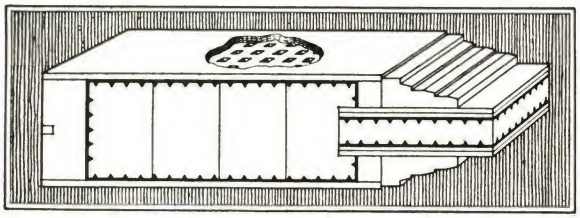
All doors to be hand or belt smoothed and entirely free from cross grain sander scratches on plain surfaces and from knife marks on mouldings and moulded edges.

Outside doors to conform to above specifications, except to be put together with waterproof glue.

All doors to receive one coat of stain and shellac (including filler if necessary), or lead and oil priming before shipment.

X-ray Lead Lined Doors

A membrane of unbroken sheet lead built into the center of a finely finished wood door, with bolts protected by lead sleeves and lead caps all concealed by the face veneer without surface plugs. Lead sheathed "split jambs" also furnished complete for X-ray rooms. Consult our Engineering service.



PYRONO FIREPROOF WOOD DOORS

Process of Construction

The PYRONO process is a mechanical method of fireproofing wood cores in the manufacture of doors and trim.

In PYRONO construction, cores of non-resinous wood are used and these when assembled are covered with pure, long fiber asbestos sheathing mechanically bonded to their surfaces, excluding oxygen, thus preventing ignition and assuring against spread of flame from the place of origin to other parts of a building—the one essential province of a fire door.

Designs—Flush doors with or without inlay. Panel doors, any arrangement of panels. Sash doors with glass lights not exceeding 720 sq. in. PYRONO doors and trim furnished in all cabinet woods used in interior finish.

Section of Stile or Rail Illustrating Pyrono Asbestos Interlined Fireproof Construction

Appropriate Use

PYRONO doors are used for stairways, elevators, corridors and partitions, in office buildings, hotels, hospitals, apartments, schools, dormitories and similar types of fireproof buildings.

Fully Tested

PYRONO, first introduced in 1910, has fully demonstrated in official tests and actual fires its perfect efficiency as a fire retardant. The most convincing proof of the fire resisting qualities lies in the fact that not one case of failure of a PYRONO door is recorded in the many actual fires which have occurred in buildings, great and small, protected by these doors.

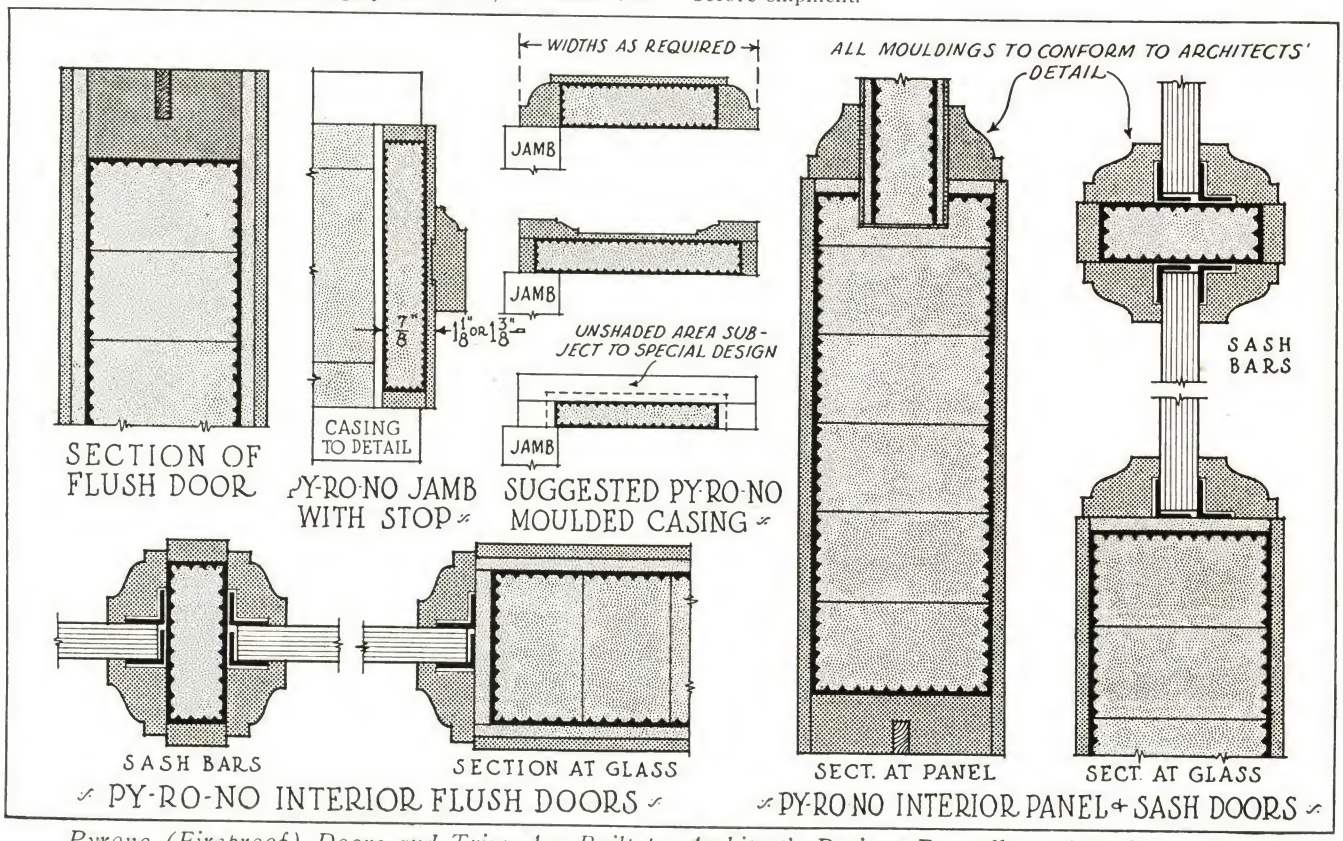
Specifications of Pyrono Fireproof Doors

Pyrono Panel Doors—Fireproof paneled veneered doors to be constructed as follows: Stile and rail cores to consist of narrow softwood strips, thoroughly kiln-dried, not more than ⅞-inch thick and glued together under pressure. This wood core to be covered on face and edges with pure long fibre asbestos sheathing thoroughly glued and indented with not less than twenty-five indentations to the square inch. Each indent to be perforated at its base to perfect the glue bond between core and veneer. Hardwood veneer as specified to be applied to face of such stiles and rails, and edge strips to match veneer to be applied to all edges.

Panels shall be laminated seven-ply with grain crossed on alternate wood plies. The ply next to the core on each side shall be pure long fibre asbestos sheathing thoroughly glued and indented to the core as indicated for stile and rail construction. Face veneer to be as specified by architect. All panels to be not less than ¾-inch thick.

All stile and rail joints to be of mortise and tenon construction.

All doors shall be hand or belt smoothed and entirely free from cross grain sander scratches.



All doors to receive one coat of stain and shellac (including filler if necessary), or lead and oil priming before shipment.

Pyrono Flush Doors—Fireproof flush veneered doors to be constructed as follows:

Cores to consist of narrow softwood strips, thoroughly kiln-dried, not more than ⅞-inch thick, glued together to form stiles, cross rails and flush panels, and framed together with mortise and tenon joints. This wood core to be covered on face and edges with pure long fibre asbestos sheathing thoroughly glued and indented to the core, with not less than twenty-five indents to the square inch. Each indent to be perforated at its base to perfect the glue bond between core and cross band.

Hardwood edge-strips of same wood as face veneer to be applied on all edges and door to be completed by application of ⅛-inch cross-band and face veneer not more than ⅛-inch thick.

All doors to be hand or belt smoothed and absolutely free from machine or sander marks that will appear on application of stain or varnish. All doors to receive one coat of stain and shellac (including filler if necessary), or lead and oil priming before shipment.

Pyrono (Fireproof) Doors and Trim Are Built to Architect's Designs Regardless of Period or Type

TRADE-MARK

Guarantee

W. D. CROOKS & SONS guarantee to replace in the white any Crooks door that proves defective in material or workmanship.

Trade-mark is stamped on top and bottom rail of each door.

Policy

Limited Quantity—Unlimited Quality.

A limited output has been the policy of this organization since its beginning over forty years ago. The company's heads believe this the only possible means of maintaining its standard on custom-built doors to architects' details, which constitute 75% of its sales.

Construction

Crooks doors are veneered with any foreign or domestic wood specified. All veneer is shrunk in a re-drying machine. It is then mechanically tested to prove the absence of moisture.

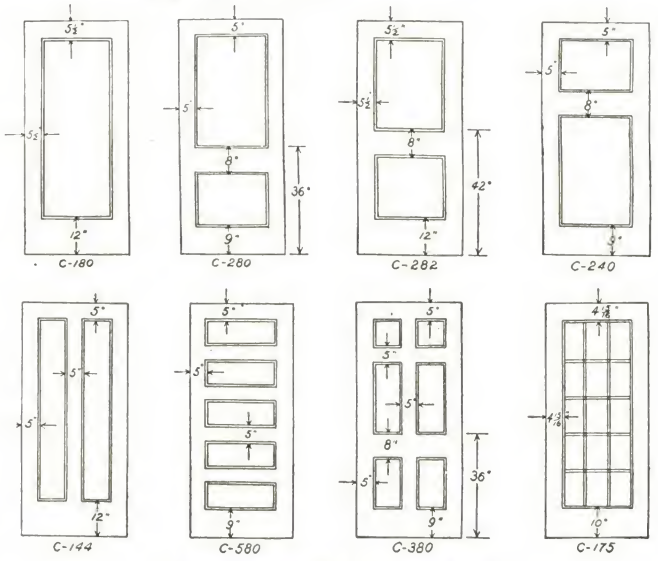
Core is "built-up" of narrow chestnut or white pine, kiln dried strips, which are glued together and kept in retainers in hot rooms until perfect joints are assured. Core is then planed to even thickness and veneers applied under hydraulic pressure. Material is again held in retainers in hot rooms until all moisture is eliminated from the glue.

Succeeding operations are practically identical in all factories, the only difference being in the skill with which the work is performed.

Stock Doors

Over 10,000 stock doors in chestnut, birch, plain red oak, red gum and walnut are always on hand for immediate shipment. Twenty designs of red oak entrance doors are included. These are made with ¼-in. *sawed* veneers and waterproof glue.

Sample (Special) Doors



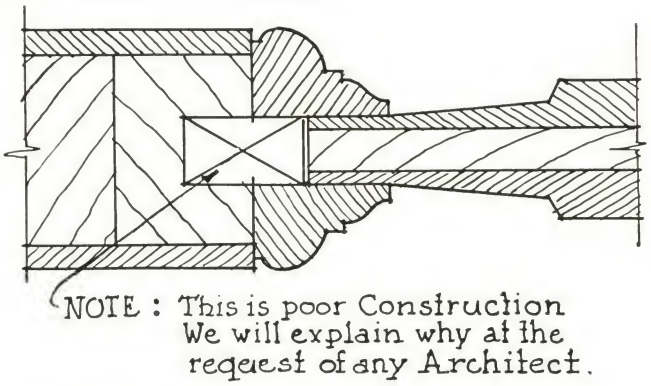
The company welcomes the opportunity to make and submit full size sample doors at actual cost. This suggestion has recently found favor with architects on a number of large buildings.

General Specifications and Details

A set of specification and detail sheets covering the best method of construction for all types and designs of veneered doors will be mailed upon request.

Standard Designs

There is always a saving in the cost of manufacture where a standard design can be used. The style of moulding on these designs is optional but should not exceed ½ in. in width.

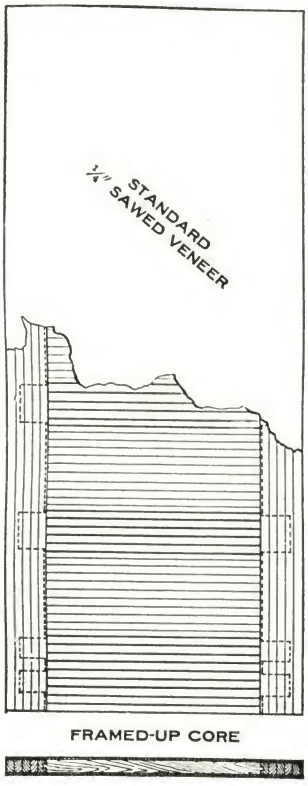


Crooks Standard Door Designs

Dimensions are overall including width of moulding

Good and Poor Construction

The construction shown in the sketch below is quite generally used even for the better class of door work. Why it is impractical and how W. D. CROOKS & SONS overcome the dangers of such constructions will be gladly explained on request.



Specifications for Crooks Non-warping Flush Door

Flush Doors to be Crooks Non-warping Construction as manufactured by W. D. CROOKS & SONS, of Williamsport, Pa.

Core—To be chestnut or white pine, to contain not more than 5% moisture. Stile core to be built up of strips not more than 1¾ in. by thickness of core, rails and panels to be built up of pieces not over 3 in. wide, glued with waterproof glue under heavy pressure.

Frame—Core of stiles, rails and panels to be *framed*, mortised and tenoned (or doweled) to make five cross

panel flush surface. All tenons or dowels well glued and door assembled under heavy pressure.

Core Door—Core of door to be sanded smooth, ready for face veneer.

Face Veneer—Face veneer to be *sawed* (not rotary cut) standard ¼ in. thick, not less than $\frac{3}{16}$ in. when sanded, and to be matched book-leaf. All joints in face veneer to be parallel with edges of door and well glued. Edges same wood as face veneer and at least ¾ in. thick.

Gluing—Face veneer to be glued to core with waterproof glue under heavy pressure and held in retainers until glue is set.

Redrying—Doors to be redried after veneering to remove all moisture contained in glue.

Sanding—Face of door to be sanded in such a manner that when varnish is applied, machine or sander marks will not show through finish.

Special Doors to Architects Design

W. D. Crooks & Sons for over forty years have co-operated with architects in all parts of the country in the construction of special doors to the design of the architect. This work has given us an experience and an insight into the problems of the architect which enables us to work with him in securing the most satisfactory results for all concerned.

Folding Partition (Accordion) Doors

We manufacture doors for folding partitions in any size or thickness and design, flush or paneled, in accordance with architect's details, ready for applying hardware and installation by contractor at building. Because of the large sizes usually required, rigid construction is all important; this we follow in manufacture.

Construction Suggestions

The information given in the following suggestions for special doors is of a practical nature and should be of value to the specification writer.

Use *sawed* veneers on cores of kiln-dried, soft wood strips.

Exterior doors, as well as all heavy duty doors, such as schoolhouse and church doors, should be detailed mortise and tenon construction.

Doors with flush or raised moulding should be mortised and tenoned.

Detail one panel doors not less than 1¾ in. thick, with panel not less than ½ in. thick.

Doors veneered with two kinds of wood should be at least 1¾ in. thick.

Doors over 2 ft. 8 in. wide or 7 ft. high should be made 1¾ in. thick.

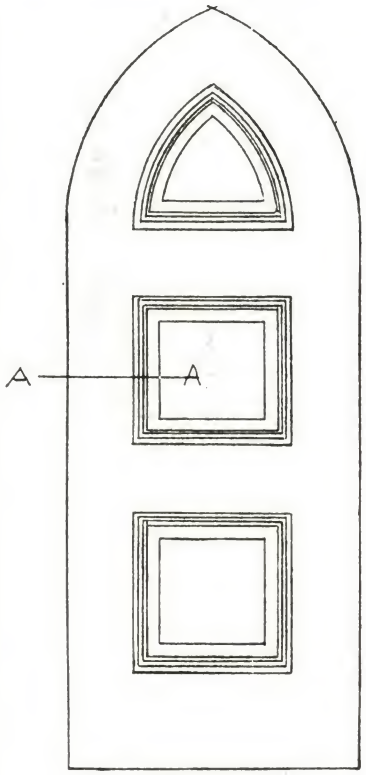
Sanitary (flush) doors should be detailed at least 1¾ in. thick.

Solid stuck mould should not be detailed wider than ¾ in.

Bars in sash doors should be at least ¼ in., not to exceed ½ in. between glass.

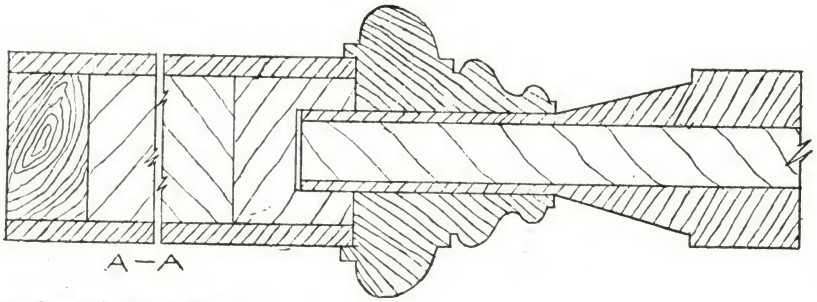
All panels, both flat and raised, should be laminated.

Specify waterproof glue and standard ¼-in. *sawed* veneers on all exterior doors.



Always specify hand sanding when expensive foreign or domestic woods are used. The results far exceed the added cost.

Sanitary (flush) doors should be hand cleaned.



List of Prominent Users of Crooks Doors

The following users are listed to further indicate the quality of Crooks doors.

House and Senate Chambers of U. S. Capitol, Washington, D. C.
Pennsylvania State Capitol, Harrisburg, Pa.
Architects Building, Philadelphia, Pa.
Sterling Memorial Library, Yale University, New Haven, Conn.
Sterling Law Buildings, Yale University, New Haven, Conn.
Institute of Biology, Harvard University, Cambridge, Mass.
War Memorial and Boldt Tower, Cornell University, Ithaca, N. Y.
Duke University (10 buildings), Durham, N. C.
Administration Building, Board of Education, Philadelphia, Pa.
Detroit-Leland Hotel, Detroit, Mich.
Senior High School and ten grade schools, Philadelphia, Pa.
John D. Rockefeller, Jr. Residence, Pocantico Hills, N. Y.
Providence Courthouse, Providence, R. I.
Delaware State Capitol, Dover, Del.
Orange Memorial Hospital, East Orange, N. J.
Office Building (Durant) General Motors Corp., Detroit, Mich.
West Virginia State Capitol, Charleston, W. Va.

CARNAHAN MANUFACTURING CO.

Veneered Doors and Millwork Since 1870

303 Mill Street
LOOGOOTEE, IND.

Products

STOCK and SPECIAL VENEERED DOORS.

Also Interior Trim, Stairs, Wainscoting, Panels and Moulding.

Special Millwork and Facilities for Production

The CARNAHAN MANUFACTURING CO. makes a specialty of interior and exterior millwork made to architects' detailed plans. All the details of mouldings, etc., are carefully cut and detailed drawings are followed accurately.

The workmanship is of the highest grade, as our equipment consists of the most advanced type of machinery and the men are thoroughly trained.

Large quantities of materials are carried in our yards and storage buildings so as to have seasoned stock from which to execute work on short notice.

Panel Doors

Stile and rail doors are made with white pine cores thoroughly dried, using the best of glue and the very latest methods of manufacturing.

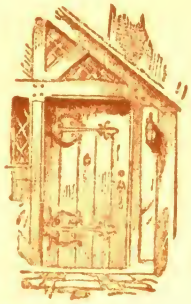
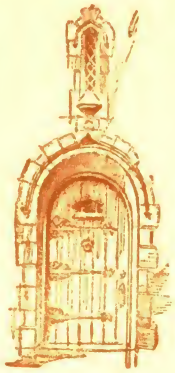
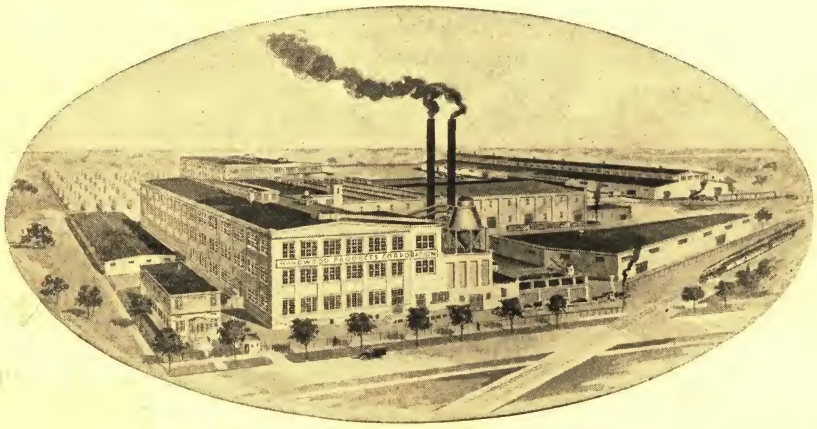
MANUAL OF VENEERED DOORS







HARDWOOD PRODUCTS CORPORATION

NEENAH
WISCONSIN

Quality Is Never an Accident But Always the Result of High Intention, Sincere Effort, Intelligent Direction and Skillful Execution

HARDWOOD PRODUCTS CORPORATION PLANT

QUALITY

QUALITY VENEERED DOOR installations are never accidents.

MECHANICAL EQUIPMENT or large volume production does not in itself produce quality. QUALITY must emanate from a determined desire on the part of the organization and every one connected with it to give the highest grade of workmanship and materials for the price quoted.

The QUALITY of HARDWOOD PRODUCTS CORPORATION VENEERED DOORS is based on the cumulative experience of a corps of master craftsmen whose long, uninterrupted association with the Company and its policies have made them quality-conscious.

HARDWOOD PRODUCTS CORPORATION doors are not orphans. Each door is stamped with our name on the top rail, assuring a guaranteed door.

It may be said that there is very little difference between doors as made by one manufacturer and another, under the same specifications, but this little difference may be an important consideration.

THE PURPOSE OF THIS MANUAL

It is the purpose of this MANUAL to coordinate all important factors of veneered door design and construction in a proper relationship, for the benefit of the ARCHITECT, DEALER, and BUILDER.

Our recommendations, as incorporated in this MANUAL, are based on the experience of many years as manufacturers of veneered doors exclusively, our production over the last twelve years alone being over 3,000,000 doors of varied woods and details of construction.

GUARANTY

WE UNQUALIFIEDLY GUARANTEE EVERY HARDWOOD PRODUCTS CORPORATION DOOR MADE ACCORDING TO OUR RECOMMENDATIONS AND AS DESCRIBED IN THIS MANUAL TO BE FREE FROM DEFECTS OF WORKMANSHIP AND MATERIAL, AND WILL REPLACE ANY DOORS THAT PROVE TO BE DEFECTIVE WITHIN THE MEANING OF OUR SPECIFICATIONS AND RECOMMENDATIONS.

THE COMPANY—ITS FACILITIES AND PRODUCTS

The Company

Located in the heart of the hardwood country, the company has been continuously in business for twenty (20) years, specializing in the manufacture of high quality hardwood-veneered and solid-softwood doors.

Responsibility

Our rating in R. G. Dun's and Bradstreet's is over $1,000,000 —first grade of credit.

Facilities

We operate one of the largest plants in the country devoted to the manufacture of hardwood-veneered and solid-softwood doors.

Our plant is equipped with the most modern and efficient door machinery.

During the last twelve (12) years we have manufactured over 3,000,000 doors for buildings in all sections of the United States and Canada.

Standard (Stock) Doors

We manufacture a complete line of Standard Hardwood-veneered and Solid-softwood Doors in a variety of standard designs.

Standard Thicknesses—1⅜ and 1¾ in.

Standard Widths—2 ft., 2 ft. 2 in., 2 ft. 4 in., 2 ft. 6 in., 2 ft. 8 in., 2 ft. 10 in. and 3 ft.

Standard Heights—6 ft. 8 in., 6 ft. 10 in. and 7 ft.

Standard Stile Widths—4⅞ and 5½ in.

Standard Rail Widths—4⅞, 5½, 8¼, 9½ and 12 in.

Note: *Standard stile and rail widths work to economical milled stock lumber and veneer sizes. Widths are full stile and rail widths and in the case of solid stuck mouldings include the moulding.*

Flush Doors

The constantly increasing demand for Hardwood Products Corporation flush doors is evidence in itself of the high quality of their construction. As a result of our drying and seasoning methods, using specially designed equipment, we have eliminated the common defects in the ordinary flush door, such as checks, ridges and waves in the face veneer.

The construction is five-ply laminated. All face veneer and cross-banding is thoroughly re-dried in veneer plate dryers before the material enters the manufacturing plant.

Flush doors are far more durable than other doors.

We can furnish this type of door as well as any other type in a fireproof construction to meet the building code of the City of New York. This fireproof feature is described on page 14.

Standard Thickness—1¾ in.

Standard Widths—2 ft., 2 ft. 2 in., 2 ft. 4 in., 2 ft. 6 in., 2 ft. 8 in., 2 ft. 10 in., 3 ft., 3 ft. 4 in., 3 ft. 8 in. and 4 ft.

Standard Heights—6 ft. 8 in., 6 ft. 10 in., and 7 ft.

Semi-special Doors

These doors have all the characteristics of special doors with the advantages of certain standardization economies. By using our standard door thicknesses (1⅜ and 1¾ in.) and our standard widths of stile (4⅞ and 5½ in.) and rails (4⅞, 5½, 8¼, 9½ and 12 in.) a considerable saving in cost can be made with no apparent loss in individual design. Special assembly of stiles and rails to suit the designer's taste may be made. Mouldings may be of special design profiles.

Special Doors

Due to specialization and our unusual mill facilities, we are able to produce—at surprisingly reasonable cost—special design doors of the highest standard of material and workmanship, in accordance with architect's details.

Fire-resisting Wood Doors

We have a complete plant for fully fireproofing wood and are manufacturing doors made of this fireproofed wood which will meet the rigid requirements of the building code of the City of New York. This code requires that doors in all buildings over 150 ft. high shall be either of steel or of fireproofed wood which will meet the prescribed tests.

X-Ray or Lead-lined Flush Doors

As a standard construction for our lead-lined Flush Doors we have adopted specifications similar to those prescribed by the New York State Building Code, which we believe to be superior to any other type of construction. See description and details, pages 11 and 13.

Standard Thickness—2⅛ in.

Standard Widths—2 ft., 2 ft. 2 in., 2 ft. 4 in., 2 ft. 6 in., 2 ft. 8 in., 2 ft. 10 in., 3 ft., 3 ft. 4 in., 3 ft. 8 in. and 4 ft.

Standard Heights—6 ft. 8 in., 6 ft. 10 in., 7 ft.

Sound-proof Flush Doors

These highly sound-resistant flush veneered doors of very practical construction are made of two ⅞ in. thick doors glued to a ⅜ in. thick center of Flax-li-num insulation. The Flax-li-num center has a wood edge 2½ in. wide by ⅜ in. thick forming a solid wood edge around the perimeter of the door. Sound Proof Flush Doors are particularly adapted to use in hospitals and for communicating doors in hotels.

Standard Thickness—2⅛ in.

Standard Widths—2 ft., 2 ft. 2 in., 2 ft. 4 in., 2 ft. 6 in., 2 ft. 8 in., 2 ft. 10 in., 3 ft., 3 ft. 4 in., 3 ft. 8 in. and 4 ft.

Standard Heights—6 ft. 8 in., 6 ft. 10 in., 7 ft.

Laminated (Three Ply) Flooring

The Hardwood Products Corporation, beside doors, manufacture an exceptionally high grade laminated (3 ply) flooring of random widths and lengths showing artificial crack lines, plugs and keys, both plain and period patterns, in plain White Oak and Quartered White Oak plain or fumed, plain Red Oak, Walnut, Teak and other accepted flooring woods.

STANDARD PANELED AND GLAZED DOORS

Construction Standards and Special Features—Specification Data

Kiln Drying and Seasoning of Material

Note: *As a result of our special drying and seasoning methods we have practically eliminated the common defects in the ordinary stock door such as checks, ridges and waves in the panel face veneers and core joints showing through the stile and rail face veneers. Our specially designed drying and seasoning equipment insures permanently smooth veneered surfaces in the finished doors.*

Cores—All core blocks are kiln-dried to from 3 to 4 per cent moisture in a specially designed core kiln.

Panels—All face veneer, center stock and cross-banding is thoroughly re-dried in veneer plate-driers and all moisture removed before the material enters the manufacturing plant. After gluing up, the finished panels are re-dried before sanding to remove the excess moisture contained in the glue.

Stiles and Rails—Before stiles and rails are machined and clamped into the finished door, they are thoroughly seasoned and moisture from the glue removed so that the finished door will contain, as nearly as possible, the same percentage of moisture (on the average about 6 per cent) as will obtain at the point of delivery and installation.

Glue

We strongly recommend the use of a selected, high grade vegetable glue for interior doors. However, where specified we can furnish our doors with the face veneers applied with waterproof glue. Laboratory tests have shown that this waterproof glue, although not affected by moisture, does not make quite as strong a glue joint as a high-grade vegetable glue.

Core Material and Construction

All core material used in building up stiles and rails is composed of clear white pine blocks. The core blocks are put together with special tongue and groove joints (see details) assuring maximum glue surface for strength and perfect, permanent alignment. Both edges of the stile and rail pine cores are finished with ⅞ in. interlocking hardwood strips.

Note: *Wherever necessary, we are prepared to furnish doors according to New York State Specifications which provide for alternating full length core strips and, in some cases, heavier veneers than usual. See detail, page 14.*

Face Veneers

Rotary-cut Veneers—Unless otherwise specified, standard (stock) Oak, Birch and Gum doors are veneered with *rotary-cut veneers, carefully selected to guard against the* rupture of the wood fiber. They cost somewhat less than sliced or sawed veneers.

Note: *Our experience proves that properly manufactured rotary-cut veneer gives a satisfactory surface.*

Sliced or Sawed Veneers—Where so specified we are prepared to furnish (at somewhat higher cost) sliced or sawed veneers. All quarter figured gum, quartered oak, walnut and mahogany veneers are either sliced or sawed.

Plain Oak—Furnished in both Red and White Oak. Stile and rail veneers should be not less than ⅛ in. thick before sanding and panel veneers not less than $\frac{1}{16}$ in. thick before sanding.

Note: *Specify whether Red or White (Red usually costs less than White); thickness for stiles and rails and for panels; rotary-cut, or sliced or sawed.*

Quartered White Oak—Furnished in large or small flake figure and in special figure, sliced or sawed veneers only. Stile and rail veneers should be not less than $\frac{1}{16}$ in. before sanding and panel veneers not less than $\frac{1}{20}$ in. before sanding.

Note: *Specify whether large or small flake or special figure. If special figure is desired, specify that manufacturer shall submit samples for approval. Specify thickness for stiles and rails and for panels.*

Birch and Gum—Furnished in Unselected, Selected Red and Selected White. The regular grades are what is commercially known as unselected, meaning unselected as to color, otherwise clear sound wood of first quality. In both Birch and Gum the outer part of the log is known as "White" and on the large logs the inside is "Red." Unselected veneers are successfully used where a medium or dark stain is applied. Either Selected Red or White Birch or Gum costs considerably more than Unselected. Stile and rail veneers should be not less than ⅛ in. thick before sanding and panel veneers not less than $\frac{1}{16}$ in. thick before sanding.

Note: *If Selected Red or White are desired, so specify, otherwise it will be understood that Unselected will be furnished. Specify thickness for stiles and rails and for panels; rotary-cut or sliced or sawed.*

Quartered Figured Gum—Produced only from the heart of Figured Red Gum logs, considered a cabinet wood, and furnished in sliced or sawed veneers only. Stile and rail veneers should be not less than $\frac{1}{16}$ in. thick before sanding and panel veneers, if highly figured, not less than $\frac{1}{4}$ in. thick before sanding. Panels should be made five (5) ply.

Note: *Specify thickness for stiles and rails and for panels. If special figure is desired, specify that manufacturer shall submit samples for approval or specify the price per sq. ft. See "Selection of Hardwood Door Veneers," page 15.*

Walnut—Furnished in half-round rotary-cut or sliced or sawed. Half-round rotary-cut is the cheapest, and the figure and texture of the veneer is not as good. Stile and rail veneers *should not be less than $\frac{1}{16}$ in. thick before sanding and panel* veneers not less than $\frac{1}{28}$ in. before sanding.

Note: *Specify thickness for stiles and rails and for panels; half-round rotary-cut or sliced or sawed. If special figure is desired, specify that manufacturer shall submit samples for approval or specify the price per sq. ft. See "Selection of Hardwood Door Veneers," page 16.*

CONDENSED SPECIFICATIONS

Paneled and Glazed Doors

For full specifications see Page 18

STANDARD DESIGN DOORS

Describe design. This will embrace standard construction and layout.

SPECIAL DESIGN DOORS

Cores

White Pine with strips not over 1¾ in. wide, tongued and grooved and dried to from 3 to 4% moisture.

Veneers

Specify thickness on stiles, rails and panels *before sanding.* Unless mentioned, standard thickness will be furnished.

Sanding

Specify kind of sanding wanted. "Well sanded" is interpreted as machine sanding. Better class jobs should be specified "belt sanded," which is almost equivalent to hand cleaning.

Miscellaneous

Specify thickness of panel; specify whether solid stuck or nailed-in mould. Unless otherwise mentioned, dowel construction is assumed.

Unless mentioned, or detailed sections are made, all dimensions will be assumed to be within standard.

Be specific on kind of wood. For example, if Red Birch (Heart) is wanted, be sure to add "(Heart)."

GUARANTY

We Unqualifiedly Guarantee every HARDWOOD PRODUCTS CORPORATION *door, made according to our recommendations and as described in this Manual, to be free from defects of workmanship and materials, and will replace any doors that prove to be defective within the meaning of our specifications and recommendations.*

Mahogany—Furnished in sliced or sawed veneers only. Stile and rail veneers should not be less than 1/10 in. thick before sanding and panel veneers not less than 1/28 in. before sanding.

Note: *Specify thickness for stiles and rails and for panels. If special figure is desired, specify that manufacturer shall submit samples for approval or specify the price per sq. ft. See "Selection of Hardwood Door Veneers," page 16.*

Dowel Construction

Unless otherwise specified, all cross rails are doweled to stiles with our special doweled construction. Dowels are of clear birch or oak not less than 1/2 in. in diameter (5/16 in. for 2 1/4 in. doors and thicker) with four (4) grooves cut the length of the dowel to permit glue to pass freely up and around the entire length of the dowel. Dowels are 5 in. long accurately set 2 1/4 in. apart O. C. and one-half their length in the stile and one-half in the rail. Dowel holes are accurately bored to provide a perfectly tight fit.

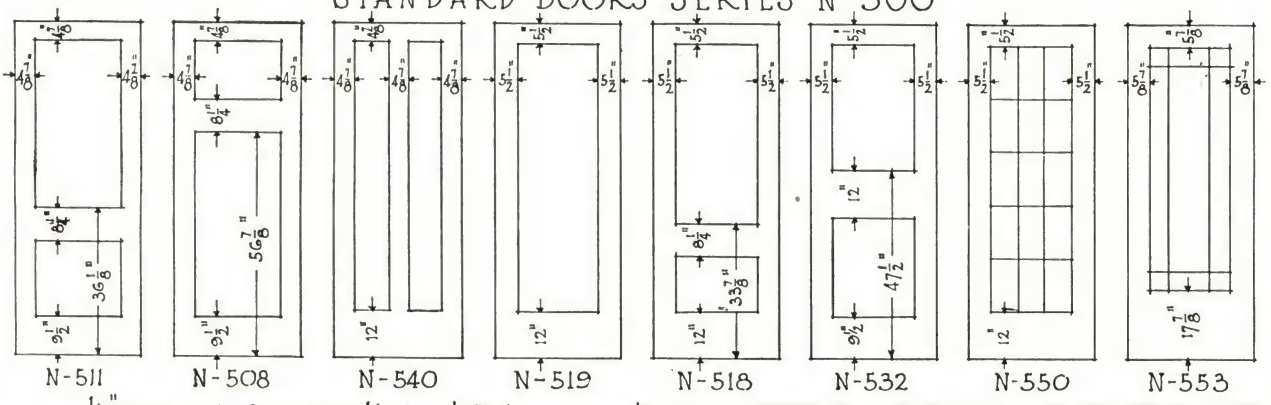
Note: *See "Doweled versus Mortised and Tenoned Construction," page 15.*

Panel Thicknesses

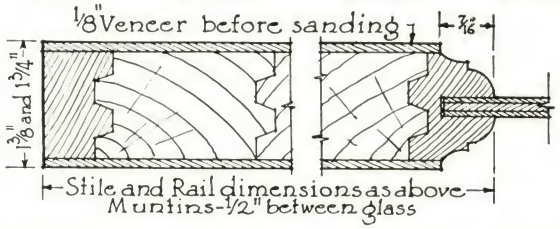
Our standard panels are 1/32 in. thick, three (3) ply. Where a thicker panel is desired we recommend 7/16 in. thick, five (5) ply.

Sanding and Finishing

Unless otherwise specified, we furnish machine sanding on all paneled and glazed doors of stile and rail construction.



We take particular pride in the quality of our machine sanding and can assure a perfectly smooth surface which requires practically no retouching by the painter. Cross-sander marks on the cross rails cannot be avoided.



Where a higher grade of sanding is required, ready for painter's finish, we recommend belt sanding or hand sanding, for which an additional charge is made.

Regardless of specifications, we belt sand the panels on all cabinet woods, such as Walnut, Mahogany, Quartered Oak, etc.

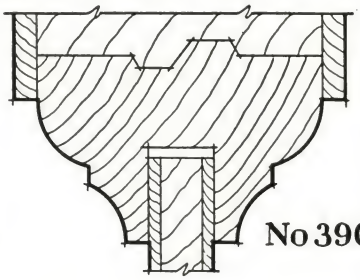
SUGGESTIONS FOR ¾" WIDE SOLID MOULDINGS



(TO REPLACE NAILED-IN MOULDINGS) On this page we present several cross-sections of solid mould profiles ¾" wide which can be manufactured at a slight increase over the standard 7/16" or ½" mould. Architects will realize a very substantial saving per door by specifying a ¾" wide solid mould of practical design in preference to a nailed-in flush mould. The solid mould eliminates the unsightly nail holes necessary in inserting the nailed-in mould and the possibility of the nailed-in mould pulling away from the stiles and rails.

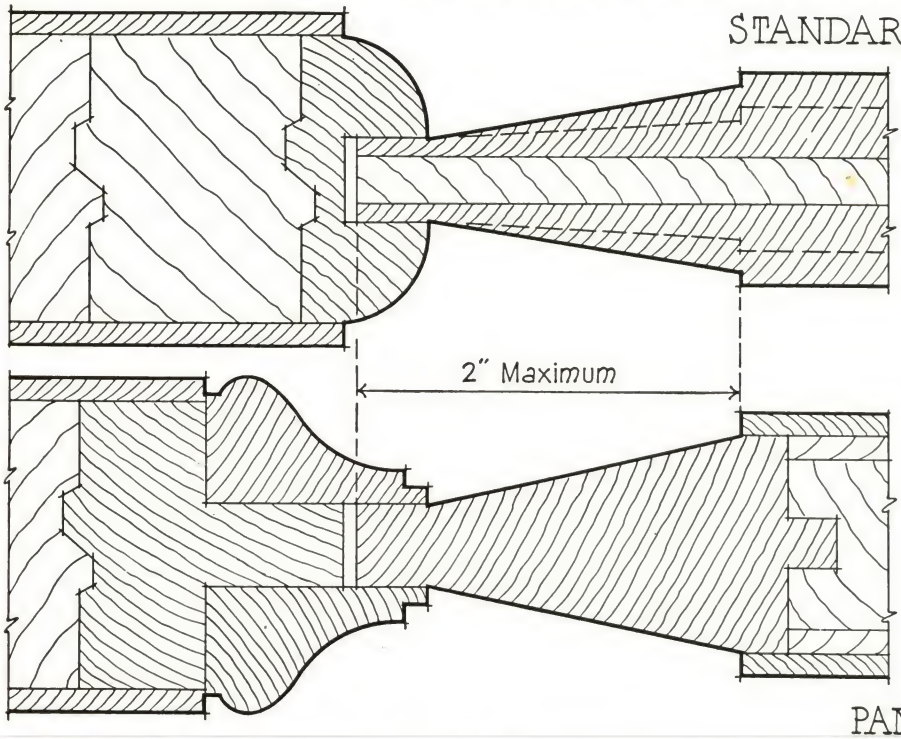
No. M-11



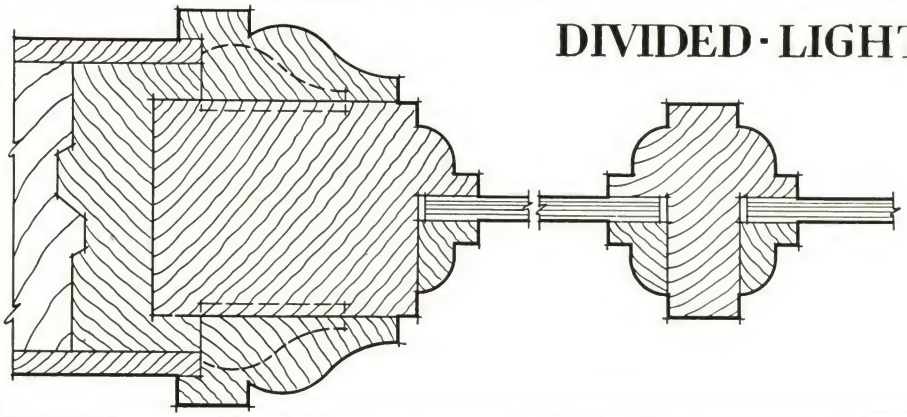
GLAZED DOOR DETAILS

Where nailed-in mouldings are required, it is suggested that details be drawn to stock profiles of flush and raised mouldings, as illustrated in the sketch below. The heavy lines indicate construction at glass with raised moulding one side, flush moulding one side and fillet. The dotted lines indicate the construction at panels with either flush moulding or raised moulding two sides.

Adherence to these profiles will prove an economy.

RAISED PANEL CONSTRUCTION

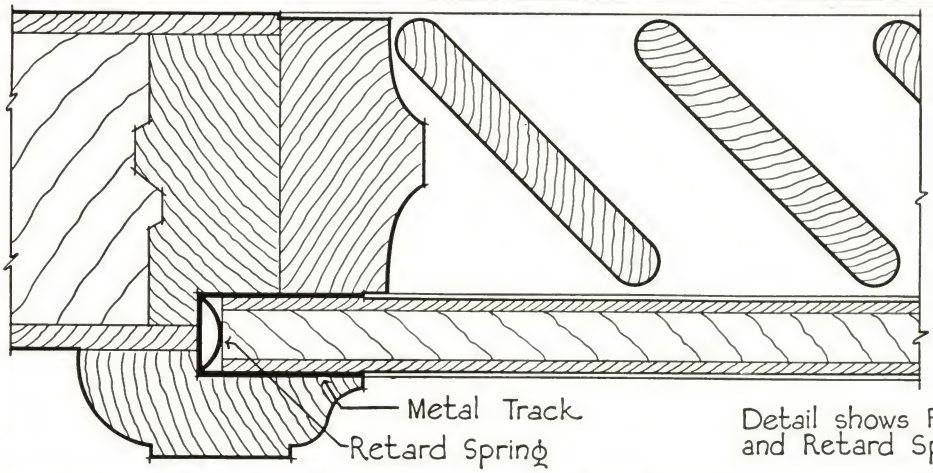
STANDARD ¾" OR 1⅛" BEVEL RAISED PANEL CONSTRUCTION



Specify 7/16" wide groove as thinner groove necessitates a heavier face veneer.

If possible specify panel raise as not over 2" from edge of panel to shoulder of raise. If this dimension is wider than 2" it results in difficulty in shaping which increases the cost.

Panel constructions adapted to either solid mouldings or nailed-in mouldings are illustrated.



SUGGESTED MITRED RAISED FRAME PANEL CONSTRUCTION

DIVIDED-LIGHT DOORS

Wherever a nailed-in mould is specified on divided-light doors we recommend an insert frame as suggested in the accompanying detail.

We do not recommend bars coped to a nailed-in mould.

FLUSH OR SANITARY DOORS

Construction Standards and Special Features—Specification Data

Door Construction

Our Flush Doors are of five ply laminated construction.

Kiln Drying and Seasoning of Material

Note: *As a result of our special drying and seasoning methods we have practically eliminated the common defects in the ordinary stock door such as checks, ridges and waves in the face veneers and core joints showing through the face veneers. Our specially designed drying and seasoning equipment insures permanently smooth veneered surfaces in the finished doors.*

Cores—All core blocks are kiln dried to from 3 to 4 per cent moisture in a specially designed core kiln.

Face Veneer and Cross-banding—All face veneer and cross-banding is thoroughly re-dried in veneer plate-driers and all moisture removed before the material enters the manufacturing plant.

After each gluing operation in the application of cross-banding and face veneer, the doors are allowed to season in our drying rooms to remove all excess moisture from the glue and to equalize all stresses and strains resulting from the gluing process.

Glue

We strongly recommend the use of a selected, high grade vegetable glue for interior doors. However, where specified and desired we can furnish our Flush Doors with the face veneers applied with waterproof glue. Laboratory tests have shown that this waterproof glue, although not affected by moisture, does not make quite as strong a glue joint as a high grade vegetable glue.

Core Material and Construction

Our Flush Door cores are built up of *clear white pine* blocks, seasoned and dried to 3% moisture in our specially designed core kilns. The core blocks are machined with a tongue and groove joint (see detail page 13), giving maximum gluing surface. The use of core blocks minimizes warping, since each block counteracts any warping tendency in adjacent blocks.

We consider our core block construction to be much superior to cores made up of strips or staves running the full length of the door, and have found from experience in manufacturing flush doors over many years that our type of core construction is superior to any other.

At the time of laying up the cores, a ⅞ in. strip of hardwood, to match the face veneer, is applied to both vertical edges of the door. These hardwood edge strips provide a solid edge for supporting the door hinges and also protect the Pine core from atmospheric moisture.

The top and bottom edges of all of our flush doors are thoroughly painted before leaving the factory, thus protecting the exposed pine cores from moisture, and still making it possible for the doors to be trimmed and fitted, without breaking off the thin edge strips used by some manufacturers.

CONDENSED FLUSH DOOR SPECIFICATIONS

For full specifications see Page 18

All flush doors shall be five-ply veneered, as manufactured by the HARDWOOD PRODUCTS CORPORATION. These doors shall be of a thickness specified by the architect.

Cores

White Pine with strips not over 1¾ in. wide, tongued and grooved and dried to from 3 to 4 per cent moisture.

Face Veneers

Unless otherwise specified, face veneers of Birch, Plain Oaks and Plain Gum, to be 1/28 in. thick; cabinet woods, such as Mahogany and Walnut, to be 1/28 in. thick (before sanding).

Edge Strips

Edge strips shall be not less than ¾ in. wide, of the same wood as face veneer. Top and bottom edges of doors to receive two coats lead and oil before leaving factory.

Cross-bands

Cross-bands to be ⅛ in. thick.

Inlaid

All inlaid doors shall be stained before inlaid, with approved color, to prevent staining of inlays. Inlaid doors to be given one coat of shellac after inlay and before shipping.

Cross-bandings

Our standard flush door construction includes heavy cross-bandings ⅛ in. thick, since the best veneered surfaces can be obtained with the use of a heavy cross-banding between core and face veneer. After applying the cross-bandings to the core, the glue is allowed to thoroughly set, after which the door is run through double drum sanding machines to insure a perfectly flat, even surface on which the face veneers are applied.

Thickness of Face Veneers

We recommend the use of face veneers not to exceed 1/16 in. thick before sanding, and in the case of cabinet woods—such as Mahogany, Walnut about 1/28 in. and Quarter-sawed Oak—about 1/20 in. thick. With our White Pine core construction and heavy cross-bandings, the use of heavier face veneers is not only unnecessary but undesirable, particularly where the face veneers have one or more joints. The joints in a thick veneer will show up through the finish after a time, to a greater extent than with a thin face veneer. In the manufacture of exterior doors we apply all face veneers with high grade waterproof cement, and do not advise thick veneers for that reason. Specifications should clearly indicate all doors which will be exposed to outside weather.

Note: *See particularly "Selection of Hardwood Door Veneers," page 15.*

Inlays

Beautiful and decorative effects can be obtained by Inlay on Flush Doors which recalls the finest in woodcraft of the past.

Inlaying is an ancient art and possesses a charm differing distinctly from other woodworking arts. Ebonized wood and White Holly or a combination of both are generally used and show beautiful contrasting effects with almost any kind of face veneer. Special designs of inlay in varying foreign woods can also be furnished when specified.

By a special process, our inlays are firmly imbedded in the door and so perfectly fitted as to be without cracks or openings.

The standard width of stock inlay is ¼ in.

Sanding and Finishing

After the final operation of applying the face veneers and re-drying, all of our flush doors are carefully belt-sanded, using a hand block. This insures a perfect veneered surface, practically equal to a hand-smoothed job. The doors when they leave our factory are ready for the painter without the necessity of going over the face veneers with sandpaper. In the event that standard drum or machine sanding is permissible, we make a reduction in cost.

Since we do not recommend top and bottom hardwood edge strips on flush doors, the top and bottom edges of all of our flush doors are thoroughly painted before leaving the factory to protect the exposed pine cores from moisture.

GUARANTY

We unqualifiedly guarantee every HARDWOOD PRODUCTS CORPORATION *door, made according to our recommendations and as described in this Manual, to be free from defects of workmanship and materials, and will replace any doors that prove to be defective within the meaning of our specifications and recommendations.*

X-RAY OR LEAD-LINED FLUSH DOORS

Note: *As a standard construction we have adopted specifications similar to those prescribed by the New York State Building Code, which we believe to be superior to any other type of construction.*

Kiln Drying and Seasoning of Material

Note: *Our specially designed drying and seasoning equipment insures permanently smooth veneered surfaces in the finished doors.*

Cores—All core lumber is kiln dried to from 3 to 4 per cent moisture.

Face Veneer and Cross-banding—All face veneer and cross-banding is thoroughly re-dried in veneer plate-driers. After each gluing operation, the doors are allowed to season in our drying rooms to remove all excess moisture from the glue.

Glue

A special glue is used to apply the cross-banding to the lead center. Elsewhere a selected, high grade vegetable glue is used.

Core Material and Construction

In preparing the core for the lead-lined door, we have a special process which enables us to glue two layers of $\frac{1}{16}$ in. cross-banding to the $\frac{1}{8}$ in. thick lead center. A layer of $\frac{3}{4}$ in. hardwood lumber core is then applied on each side after which the entire cored slab is bored and bolted together with large flat head elevator bolts which are spaced 8 in. on center. The bolts are countersunk about $\frac{1}{8}$ in. and the space above the bolt heads is then filled by a tight-fitting lead plug driven flush with the surface of the hardwood core. See detail, page 13.

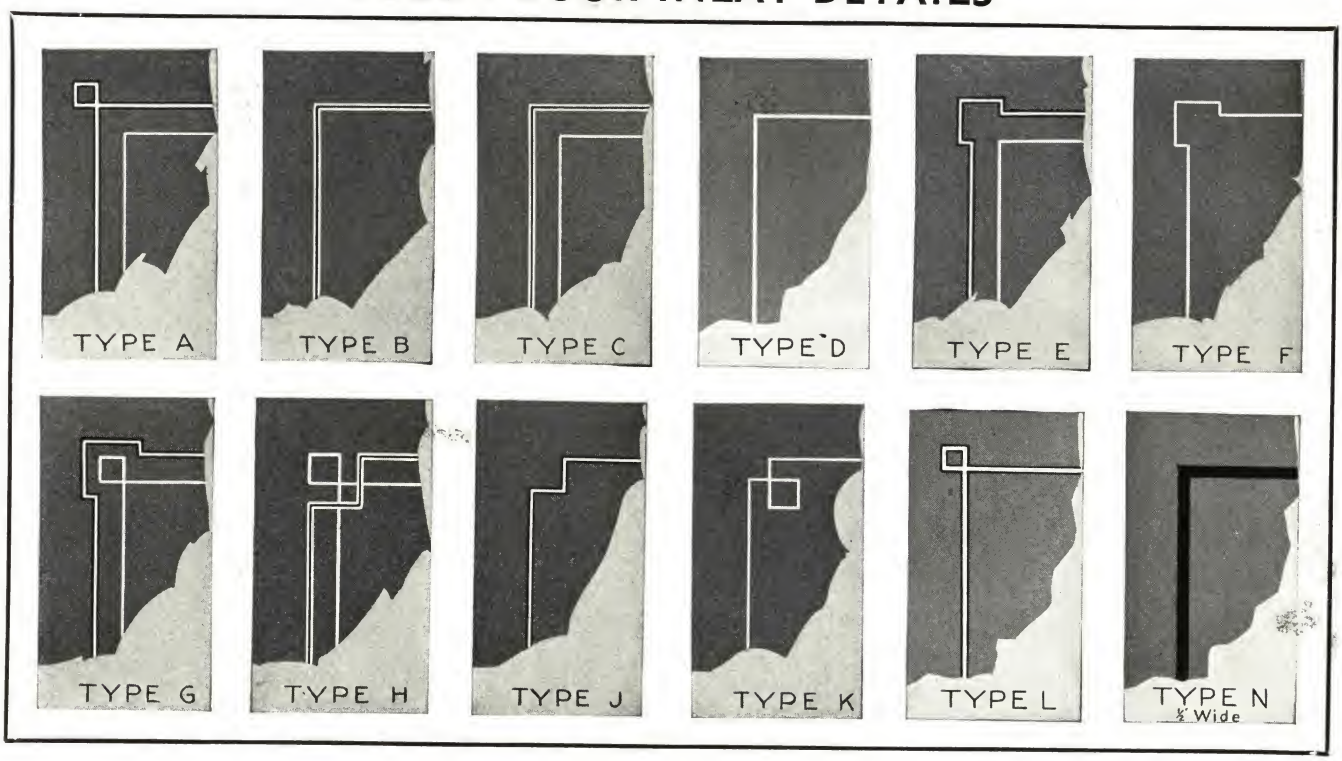
In order to eliminate difficulties with bolts in mortising lead-lined doors for locks, we leave a space about 3-0 from the floor on one edge of the door and mark this edge for identification purposes by boring a shallow hole on the top of the door on the lock side edge.

Cross-bandings

Our standard flush door construction includes heavy outside cross-bandings $\frac{1}{8}$ in. thick.

Thickness of Face Veneers

We recommend the use of face veneers not to exceed $\frac{1}{16}$ in. thick before sanding and in the case of cabinet woods—such as Mahogany, Walnut about $\frac{1}{28}$ in. and Quarter-sawed Oak—about $\frac{1}{20}$ in. thick.



Sanding and Finishing

After the final operation of applying the face veneers and re-drying, all of our flush doors are carefully belt-sanded using a hand block. This insures a perfect veneered surface, practically equal to a hand-smoothed job, ready for the painter without the necessity of going over the face veneers with sandpaper. In the event that standard drum or machine sanding is permissible, we make a reduction in cost.

SOUND-PROOF FLUSH DOORS

The manufacturing construction standards and special features applying to our Standard Flush or Sanitary Doors as set forth on page 10 apply likewise to our Sound-proof Flush Doors. The door is made up of two $\frac{7}{8}$ in. thick Flush Doors glued to a $\frac{3}{8}$ in. center of sound absorbing Flax-li-num. The Flax-li-num center is surrounded with a hardwood edge $2\frac{1}{2}$ in. wide and $\frac{3}{8}$ in. thick of the same wood as the face veneers, forming a solid wood edge around the perimeter of the door. Tests prove this construction highly sound insulating. See detail, page 13.

SUGGESTED DETAIL FOR EXTERIOR GLAZED FLUSH DOORS

FIRE-PROOF WOOD DOORS

Fulfill New York Building Code Requirements

The HARDWOOD PRODUCTS CORPORATION have a complete plant for fire-proofing wood and are manufacturing doors made of this fireproof wood which will meet the rigid requirements of the building code of the City of New York.

The lumber is treated with chemicals, whose functions are threefold: they give off, when heated, a non-inflammable, fire-extinguishing gas; they fuse over the wood in a protective coating; and they exclude the oxygen necessary to combustion by obstructing the pores of the wood.

Method of Treating Lumber

All lumber and core material to be treated for fire-resistant qualities is first kiln-dried and then placed in a steel cylinder. The cylinder is then closed and the air exhausted and the interior of the cylinder kept under a vacuum for several hours. The fire-proofing solution is then admitted to the cylinder and forced into the cells of the wood under pressure until the wood is thoroughly impregnated.

The material is then removed from the cylinder and subjected to air-drying for from two to three weeks and is then again placed in dry kilns. The kiln-drying process ordinarily takes from four to five weeks depending upon the thickness and texture of the lumber to be dried. Items of veneer up to ¼ in. thick can be fire-proofed, air-dried and kiln-dried in from two to three weeks.

After the doors are delivered, the Building Inspector in New York City takes a certain number of doors at random from the shipment and cuts them up into samples which are then taken to the laboratory at Columbia University at New York and tested in the presence of a representative from the New York Building Department. There are three different tests made from each sample of wood, known as the "timber test" the "crib test," and the "shaving test" as follows:

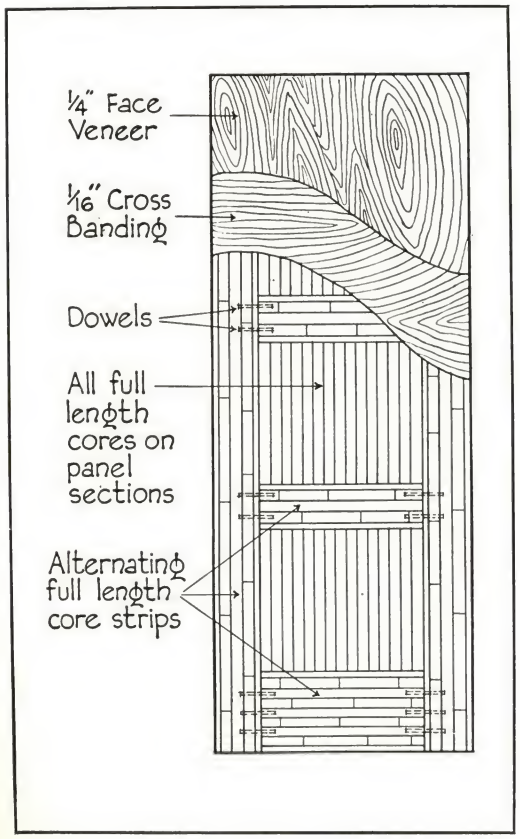
Fire-proof Tests

For the timber test, samples ¾ in. x 1½ in. wide are put over a crucible furnace at a temperature of 1700° Fahrenheit for two minutes. After they are removed from the flame, the flames must not persist longer than 15 seconds, nor the glow longer than 20 seconds. The unburned area should not be less than 55% for hardwoods and not less than 45% for softwoods.

For the crib test, the samples are ½ in. square and 6 in. long, and are built up crib fashion over a Bunsen burner and exposed for a period of one minute at a temperature of 1200° Fahrenheit. The flame must not persist for more than 20 seconds after the burner is removed and the glow for not more than 30 seconds.

For the shaving test, the shavings about 2 in. deep are placed in a wire mesh basket and packed down moderately to reduce the air space. A Bunsen yellow flame is placed beneath and in contact with the shavings and removed after 25 seconds. The flame should not show higher than 6 in. above shavings and shavings should not be consumed in less than 5 minutes.

All samples taken from doors as above described have to pass these three tests before doors are accepted.



Recent Fire-proof Door Installations

Doors supplied by our company manufactured of fire-proofed wood under our process have been installed in a large number of buildings in recent years, including the following buildings of prominence in New York City:

Waldorf-Astoria Hotel	Piccadilly Hotel
Hotel Pierre	Madison Hospital
The New York Athletic Club	Down-Town Athletic Club
Victoria Hotel	New Weston Hotel

We can supply millwork manufacturers with lumber impregnated in our plant which will meet the requirements of the Building Code of the City of New York.

NEW YORK STATE SPECIFICATION DOORS

MADE EITHER FLUSH OR FRAMED-PANEL CONSTRUCTION SKETCH AT LEFT SHOWS FLUSH CONSTRUCTION

Wherever required, we are equipped to furnish doors according to NEW YORK STATE SPECIFICATIONS which provide for alternating full length core strips on the stiles and rails, and ¼-in. face veneers, to finish $\frac{3}{16}$ in. after sanding.

The accompanying elevation shows the accepted construction for flush doors.

The construction for the Framed-Panel door provides also for alternating full length core strips on stiles and rails with $\frac{3}{16}$-in. finished face veneers, while the panel construction is generally the same as stock doors.

Unless otherwise specified, dowel construction and machine sanding is furnished, although mortise and tenon and belt or hand sanding can be furnished if desired.

This type of door can be furnished in either fire-proofed or non-fire-proofed construction.

Our extensive activities in New York State, particularly in the Metropolitan area, have naturally necessitated our quoting on and manufacturing door jobs requiring New York State Specifications.

The commendatory comments which we have received on such jobs on which we have furnished doors to these specifications justifies our conviction that our manufacturing methods have met the severe requirements of the Building Department of the State of New York.

While the cost of constructing doors to these specifications is somewhat higher than the regular stock design, the construction, nevertheless, is very practical, and has been adopted on many other jobs that would not ordinarily come within the jurisdiction of the New York State Building Code.

We quote below several outstanding installations on which we have furnished doors during the past few years, according to New York State Specifications:

Utica State Hospital (Treatment Bldg. No. 1), Marcy, N. Y.
Hudson River State Hospital (Staff Apts. and 2 Nurses Homes), Poughkeepsie, N. Y.
State Normal School (Practice School), New Paltz, N. Y.
Centralslip State Hospital (1 Building), Centralslip, Long Island, N. Y.
Pilgrims State Hospital (1 Building), Brentwood, Long Island, N. Y.

Our usual guaranty applies to all doors which we make according to New York Specifications.

PRACTICAL SUGGESTIONS AND ECONOMIES

Detailing and Specifying Wood Doors

Doweled versus Mortised and Tenoned Construction

Advantages of Doweled Construction—A surprisingly large number of special doors are still detailed or specified with mortise and tenon joints, in spite of the fact that stock doors are no longer made that way.

The present doweled construction was developed to *conserve material, reduce warping, speed up production, and prevent the introduction of the considerable amount of moisture which the glue on large tenons carries into the stiles.* It also simplifies the construction of cores for rails as in the older superseded method it was necessary to make all the core blocks on the ends of the rails at least as long as the tenons are deep —a waste with no resultant benefit.

Conclusive Tests—There has naturally been considerable controversy on the relative merits of the doweled construction as compared with the mortised and tenoned construction in veneered doors. We recognized the uncertainty in the minds of some architects as to the relative merits of these two types of construction and accordingly conducted exhaustive tests through the College of Engineering, Cornell University, on twelve of the best obtainable mortised and tenoned construction stock doors and twelve of our own standard doweled construction doors picked at random from local warehouse stock. This test proved conclusively that the doweled construction is equal to or better than the mortised and tenoned construction. The tests not only covered those for comparative strength but for comparative reaction through varied humidity conditions. We have on file the complete results of these tests and will be glad to furnish a summary on request.

Mortised, Tenoned and Wedged Construction—However, we have complete equipment for mortising and tenoning doors and will furnish veneered doors with this construction, at an additional cost, provided the specifications definitely call for this type of construction. We can also manufacture doors with the mortised, tenoned and wedged construction, which is far superior to the ordinary mortised and tenoned construction. The wedged construction, in addition to the mortise and tenon, makes a very favorable comparison with the doweled construction and has been specified frequently, particularly on Government jobs. The wedged construction naturally costs a little more than the ordinary mortised and tenoned construction.

Selecting and Specifying Face Veneers

How Best to Define the Quality—One of the most important, and at the same time, most difficult items of fine millwork and cabinetwork specification is the defining of the figure and quality in veneers. Millmen cut all the defects out of exposed veneers as a matter of course, but do not always furnish the kind of figure the architect desires nor buy as expensive veneers as he expects.

To merely specify "well marked" or "highly figured" veneers is not explicit enough. If the architect is not sure of exactly what species, method of cutting, sapwood restrictions, and amount of figure he requires, it will be far simpler for him to secure samples than have the millman make changes after the work has been delivered to the job.

Veneer manufacturers are usually glad to submit samples of figured veneers of the various species, together with the prices charged for them. The price of quartered figured red gum veneers vary from 1½ to 6¢, walnut veneers from 2½ to 15¢ a square foot, and other high priced veneers in about the same proportion.

It is suggested that architects, when they have described the veneers, and have required that samples be submitted for their approval, shall also definitely specify the prices to be paid for the highly figured veneers. Then the different cabinetmakers who figure on the work can use the same veneer cost in making up their estimates and so compete on an equal basis.

There are three methods of making veneer: rotary cutting, by which the veneer is peeled from a log revolved on a lathe, slicing and sawing. The method used is determined by the character of the wood, the figure desired, and the value of the veneer. Over 90% of all veneer is produced by the rotary process.

Veneers used on hardwood doors are free from all defects. The term "selected," which to some architects means freedom from knots, checks and other defects, is used by the door manufacturer to indicate selection for color or figure.

Veneer Thickness—The specification of veneer thickness should state whether it is to be before or after sanding, preferably the former. Sanding takes off about $\frac{1}{32}$ in. The standard thickness of rotary-cut face veneer for stiles and rails of panel doors and for slab doors which are not crossbanded is ⅛ in. before sanding. Panel or flush door veneers may be $\frac{1}{16}$ in. The most expensive woods are cut thinner, particularly for panels, $\frac{1}{20}$ in. and even $\frac{1}{28}$ in. being not uncommon. The heavy veneers often used on the stiles and rails of outside doors are usually resawed from lumber, ¼ in. thickness before sanding being standard.

It is well to remember these standard thicknesses when stating the thickness to be required so that unnecessary expense and sanding may be avoided. A door on which veneer ⅛ in. after sanding had been specified would cost as much as one with veneer $\frac{7}{32}$ in. after sanding because both doors would be made with standard ¼ in. veneer, and sanded to the required finished thickness.

Unselected or Selected for Color—Nearly all the hardwoods used for face veneers have a ring of light colored sapwood several inches wide around the outside of the log. In some species this sapwood necessarily forms a large part of the veneer production, so the specification of all heartwood veneer increases the cost considerably. Whenever dark stains or enamel finishes are to be used it is economical, and just as satisfactory, to use veneer which has not been selected for color. A typical case of where such a saving could have been made was that of an architect who recently specified "selected red birch" doors and then, just before shipment, asked that they be primed for an enamel finish. In this case the insertion of the two words "selected red" cost the owner $600 on a $6000 door contract, and no benefit resulted.

Birch—Birch veneer used in doors is nearly all cut from trees known botanically as yellow birch. The smaller more defective red birch trees produce most of the curly birch veneer used in cabinetwork, but the species is little used in door manufacture. For this reason red birch means, to the door manufacturer, the heartwood of the yellow birch tree and refers to color rather than species. For doors to be given light natural finishes the specification "selected red for color" increases the cost over unselected birch by about 10%. Selection of all sapwood veneer is unusual as the figure, though much the same after staining, is not so pronounced as that of heartwood when light finishes are used, and of course there is no reason for using any but unselected veneer when dark finishes or enamel will give the surface a uniform color. Birch is rarely selected for figure as nearly all of it is well marked. Most of it is rotary-cut as other methods do not give the characteristic pleasing figure. Some veneers thicker than ⅛ in. are resawed from flat sawed boards because very thick rotary cut veneer is apt to split.

Gum—Gum, which is usually rotary-cut, comes from the red gum tree, but contains much sapwood that is almost white. Unselected gum may contain any percentage of sapwood, and usually has both heart and sap on the same door. Doors veneered with gum selected red for color cost about 25% more than unselected. Occasionally rotary-cut gum is selected for both red color and prominent figures, but the figure to be obtained by this selection should not be confused with the more expensive quartered figured red gum.

Quartered Figured Gum—Quartered figured gum is cut radially from occasional freak logs. Sliced veneer is used for panels and sawed veneer for stiles. Its price, like that of figured walnut, varies considerably, so the submission of samples or the specification of the price of veneer to be used will often avoid misunderstanding. Prices per square foot vary for quartered gum from 1½ to 6¢, so an indefinite specification allows a great deal of latitude. Veneer manufacturers will usually supply architects with free representative samples of the different priced veneers.

Red Oak—The oaks, because of the wide variety of their figure and coloring, cause more than their share of misunderstanding between architects and manufacturers. Red oak is rotary-cut or, for thick veneers, flat sawed as it has little figure when quartered. The bold flat sawed figure is characteristic of nearly all red oak veneers, and also of brown ash, a wood which is recently becoming popular for doors. Rules for grading veneers permit sap and minor discolorations, just as lumber grading rules do, so if the doors are not to be fumed or stained, it is desirable that veneers be selected for uniform color. This costs about 10% extra. The Northern oak commonly used on doors has but little sap, however, and careful staining will give a satisfactorily uniform color.

White Oak (Plain and Quartered)—White oak may be rotary-cut or quarter-sawed. Quartered veneers are always sawed rather than sliced because the medullary rays or "flakes" chip out in slicing. Quarter-sawed strips of veneer have up to 1½ in. of sapwood on one edge so the elimination of this sap means cutting off and throwing away a part of the veneer rather than merely selecting pieces of heartwood as is done in birch or gum. Sometimes this may cause the loss of fully a fourth of the material.

Rotary-cut white oak costs 5 to 10% more than red oak. Quarter sawing adds about a third, and selection for uniform color perhaps another 25% to the cost of rotary cut. Occasionally, selection is also made for prominent or medium flake in quarter sawed stock. Otherwise, any well marked quartered veneer will be used, though in any case all of a panel is usually made from the same flitch to avoid glaring contrasts.

Walnut—American walnut is rotary-cut or sliced, the latter method being used in the production of most highly figured veneers. Unselected walnut, like unselected veneers of several other species, may contain a large percentage of light colored sapwood. This light colored sapwood is difficult to detect from heartwood after skillful staining, but when the doors are shipped entirely unfinished, it not infrequently causes rejection by the architect, even though selection for the well known black walnut color has not been specified. For this reason some manufacturers make it a practice to stain the sap on all unselected walnut doors they make. The wide variety in the figure and cost (from 2½ to 15¢) of any but unselected walnut makes it desirable to submit samples or to specify the cost of the veneer when describing the veneer to be used.

Mahogany—Lumber and veneers of a number of species have been sold as mahogany. All the species of true mahogany are confined to Central America and adjacent portions of Mexico, South America and the West Indies. Khaya, or African mahogany, as it is commonly called, comes from the west coast of Africa and looks so much like true mahogany that it is difficult for anyone but an expert to tell them apart. The use of the name Philippine mahogany has been restrained by the Federal Trade Commission, so now the various species formerly sold under that name are known as Philippine hardwood.

Mahogany logs are usually sliced or sawed radially for veneer in order to secure the characteristic "ribbon" figure, so veneer, unless it is heavy veneer sawed from lumber, is usually more or less striped even when not ordered that way. Very highly figured veneers are available in mahogany, as in walnut, but they are not much used in door manufacture. There is considerable variation in color, but selection for uniform color is seldom required because of the stains used in finishing. Sapwood is mostly hewn off the logs before they are hauled from the forests so veneers are all heartwood. Doors made of Central American mahogany cost about 10% more than African mahogany doors. African mahogany is somewhat coarser textured than true mahogany, but the characteristic ribbon strip is just as pronounced.

Philippine Hardwood—The color of the Philippine hardwoods formerly sold as Philippine mahogany ranges from a deep reddish brown to straw color. Veneers are described as either red or light brown, doors veneered with the red stock costing 8 to 10% more than the light brown. The selection of Philippine hardwood veneer and its finishing are much like that of mahogany.

Economy in the Design of Special Paneled Doors

Introduction—Manufacturers of stock hardwood doors are continually studying their designs and methods of construction trying to build doors better and more economically. Since special doors are made in the same plants by the same machinery, and by much the same processes as are stock doors, the architect, in detailing his special doors, should not depart from standard construction more than is necessary to secure the effect he desires. One of the greatest advantages of wood doors is the ease with which the architect may carry out his own ideas of design at a reasonable cost. Often, details come to door factories which increase the cost considerably with no resulting improvement in the doors. Construction which looks all right to one not thoroughly familiar with the actual manufacture of doors may be impractical from a production standpoint. In this article will be pointed out some of the most common of these departures from standard practice, except those that relate to veneers and panel construction.

Spline or Fillet Not Necessary—In Figure 1 is shown the old method of detailing a panel door with a fillet to which the molding is nailed. On the right is the preferred detail in which the panel is carried into the stile, giving stronger, cheaper and more rigid construction. When molded doors were built with solid panels the fillet held the molding close to the stile when the panel became narrower due to shrinkage. This shrinkage need not be considered now, as in the modern plywood panels the shrinkage is negligble. Distortion, if any, is that of twisting, so it is desirable that the panel be firmly anchored to the stiles and rails. This removes all stresses from the mouldings and allows their use as decorations only. When it is necessary to use a wide solid panel the fillet may serve a useful purpose, but nearly all wide panels are now of plywood construction.

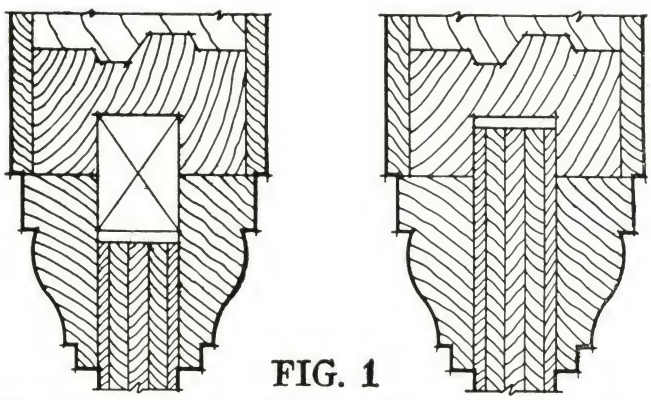


FIG. 1

The Construction Shown on the Right, without the Spline, Is Preferred

Economize by Specifying Solid Sticking Wherever Possible—A door which has the molded effect stuck on the stiles and rails costs 75¢ to $1.00 less to manufacture than does a moulded door, and does not have the nail holes or the possibility for imperfect joints in the moulding that are found in a molded door. For these reasons it is desirable to use sticking wherever possible. It is desirable to hold sticking down to $\frac{7}{16}$ in. in width, and to be sure that none of the profiles overlap, as the moulding is all cut with one knife on the sticker. In Figure 2 is shown an actual detail of a moulded door and, on the right, an altered design which could have been readily stuck on the stiles and rails. Where the effect to be secured requires that the profiles of the molding overlap, it is, of course, impossible to stick the design, but often the change necessary for sticking can be effected without greatly changing the design. Few door manufacturers venture to change an architect's molding details in the slightest, but the architect himself often can very easily.

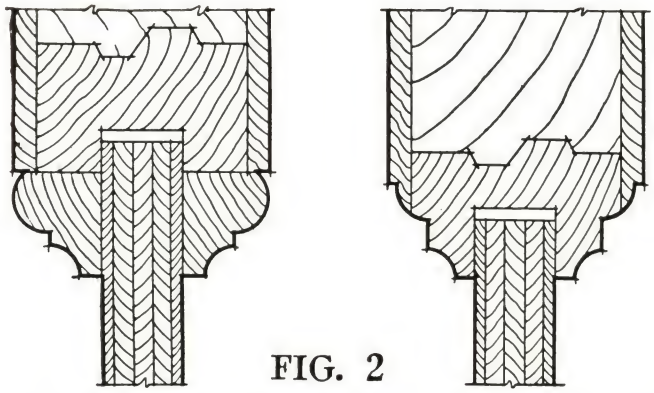

FIG. 2

Narrow Mouldings Can Often Be Stuck on the Stiles and Rails with but Minor Changes in Design. The Detail Shown on the Right Is $0.75 to $1.00 Cheaper per Door (One Panel Design) Than the Molded Detail on the Left

Specify Type of Moulding Around Glazed Lights—On paneled doors, with divided glazed lights above, specified with flush or raised molding, the millman should know whether the molding is to go around both lights and panel or the panel only. If such a molding is required around the divided opening, it necessitates the use of an inserted sash (see detail, page 8), since it is almost impossible to stick bars and muntins to match flush moldings. One dollar to $1.25 a door will be saved by designing bars and muntins which can be stuck. If they are designed for sticking, it is easy to stick the stiles and rails too with the same knives, and then rout out the stiles and rails around the panel to receive the molding.

How to Detail Stuck Mouldings—In detailing stickings for stiles and rails care should be taken to see that none of the molded surfaces coincide with the glue line of the face veneer as more or less chipping of glue and wood is bound to occur during sticking. Figure 3 shows a typical example of this sort. By carrying the cut down $\frac{1}{32}$ in. or so into the edging strip, any chance for chipping at the joint will be avoided.

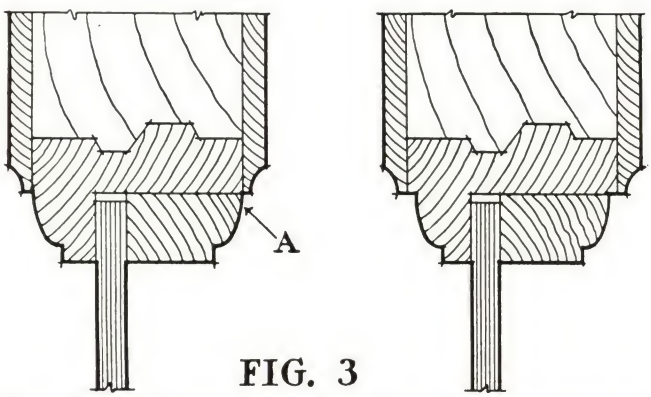

FIG. 3

When the Detail Requires a Cut Too Close to a Glue Line, as at A, Chipping Is Apt to Result. By Carrying the Cut Below the Glue Line (right) This Chipping Can Be Prevented

Avoid Feather Edge Sticking—Whenever the stuck surface meets the face of the stile at but slight angle, a feather edge must be tenoned on the end of the rail. This tenon is hard to machine and assemble, and the joint nearly always shows as an irregular line after sanding. When face veneer is $\frac{1}{8}$ in. or less in thickness it is a good idea to show, where the contour of the sticking will permit, a right angle cut from the face of the stile down through the veneer, and into the edging strip at least $\frac{1}{32}$ in. This conceals the glue line in the angle, and helps make a firm true joint between stiles and rails. See Figure 4.

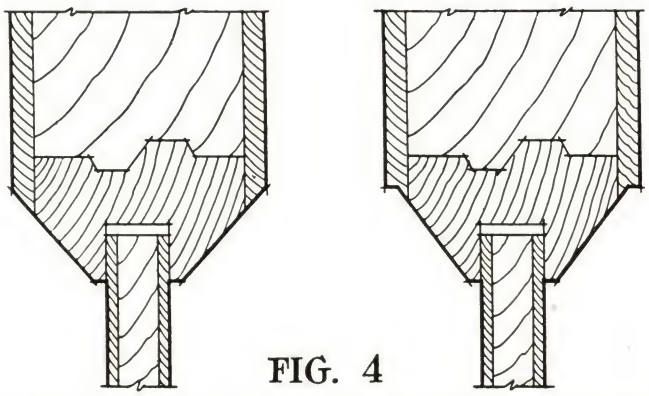

FIG. 4

A Bevel or a Shallow Curve Which Runs to the Surface of a Stile Makes a Difficult Joint to Machine and Usually Makes the Joint Show as an Irregular Line After Sanding. The Construction Shown at the Right Is Better

How to Specify Flush Mouldings—Flush mouldings should, where possible, be brought out almost even with the surface of the stiles and rails, or at least near enough to cover the joint between the core and the face veneer. If the moulding is so low that the glue line is exposed, edging strips on the inside of the stiles and rails are necessary just as though they were to be stuck instead of moulded. The addition of these hardwood edging strips is expensive, and increases slightly the tendency of the stiles to warp.

Doors with Two Kinds of Veneers

Avoid wherever possible doors of two kinds of wood on opposite sides (particularly those $1\frac{3}{8}$ in. thick), due to the tendency to warping and twisting. Where this cannot be avoided, refrain from specifying rabbeted jamb or plowed-in stops—planted stops may be adjusted to accommodate twist, etc.

Combined Flush and Paneled Doors

Do not design a door of flush or sanitary type on one side and paneled on the other on account of tendency to twist.

Exterior Doors

Exterior doors should not be less than $1\frac{3}{4}$ in. thick, and if paneled doors, with stile and rail veneers not less than $\frac{1}{4}$ in. thick before sanding. Panels should be five (5) ply. If flush doors are used, requiring joints in face veneer, use thinner veneer (see page 12). Use water-resisting glue only.

Muntins

Muntins for glazed doors should not be less than $\frac{1}{2}$ in. between glass.

Door Thickness

The following should be made not less than $1\frac{3}{4}$ in. thick: doors over 2 ft. 8 in. wide; doors with one long panel; flush or sanitary doors.

Mouldings

Solid stuck moulding should not be detailed over $\frac{3}{4}$ in. wide. For moulded doors, do not detail mouldings for $1\frac{3}{8}$ in. thick doors over 1 in. wide or for $1\frac{3}{4}$ in. thick doors over $1\frac{1}{8}$ in. wide.

Sanding

All doors, unless otherwise specified, are machine sanded. If a high grade finish is desired, belt sanding or hand sanding should be specified. Belt sanding costs less than hand sanding. All flush doors should be belt sanded.

MASTER SPECIFICATIONS

Hardwood Veneered Doors

Note: *Notes are explanatory or advisory only and are not to be included in the specification.*

Note: *Select and include only those clauses which apply to the particular work. Words or clauses within brackets in italics are selective.*

(1) Work Included

Note: *List and locate doors to be included under this specification, either in schedules on plans or under this heading. If in schedules on plans, refer here to Sheet No. .....*

(2) General

(2a) All *(veneered) (and) (solid)* wood doors shall be as manufactured by HARDWOOD PRODUCTS CORPORATION, Neenah, Wis., or equivalent, meeting fully this manufacturer's standards of materials and construction as set forth in their catalogue in in the current edition of SWEET'S ARCHITECTURAL CATALOGUES.

(2b) All wood shall be fireproofed to meet the prescribed tests of the Building Code of the City of New York.

(2c) Doors shall be of sizes indicated *(on plans) (in schedules on plans) and of design (detailed) (specified under types).*

Note: *For standard sizes, see page 1*

For condensed specifications see Page 2 for Paneled Doors and Page 10 for Flush Doors.

(3) Types

Note: *Select type. If more than one type is to be included, list and locate each under a separate heading.*

(3a) Doors shall be Standard (stock) design No. *(specify No.).*

Note: *See "Construction Standards," page 2.*

(3b) Doors shall be Semi-special design using standard stile and rail thicknesses and widths with panel arrangement and special mouldings in accordance with the detail drawings.

Note: *See page 1. Also "Economy in the Design of Special Paneled Doors," page 16.*

(3c) Doors shall be Special design in accordance with the detail drawings.

Note: *See heading "Practical Suggestions and Economies," page 15.*

(4) Materials and Construction

(4a) Glue—

(4a1) Glue shall be selected high grade vegetable glue.

(4a2) Glue for exterior doors shall be water-resisting.

(4a3) Glue for attaching cross-banding to lead sheet in X-Ray doors shall be special as used exclusively by HARDWOOD PRODUCTS CORPORATION.

(4b) Cores—

(4b1) Core blocks *(and full length core strips)* shall be of clear white pine with tongue and groove glue joint. Core finish on stile edges shall match the wood of face veneers.

(4b2) Cores shall be constructed in accordance with the New York State Building Code requiring alternate full length core strips.

(4b3) Cores for soundproof flush doors shall be tongued and grooved.

(4b4) Cores for X-Ray doors shall be of hardwood, not tongued and grooved.

(4c) Face Veneers—

Note: *See pages 2, 10 and 11 and especially "Selecting and Specifying Face Veneers," page 15.*

(4c1) Exterior paneled door stile and rail veneers shall be *(rotary-cut) (sliced or sawed) .... thick of (specify wood). (Allow ..¢ per sq. ft. for veneer to be selected by the architect.)*

(4c2) Flush door veneers shall be *(rotary-cut) (sliced or sawed) .... thick of (specify wood). (Allow ..¢ per sq. ft. for veneer to be selected by the architect.)*

(4c3) Interior paneled door stile and rail veneers shall be *(rotary-cut) (sliced or sawed) .... thick of (specify wood). (Allow ..¢ per sq. ft. for veneer to be selected by the architect.)*

(4c4) Panel veneers shall be *(rotary-cut) (sliced or sawed) .... thick of (specify wood). (Allow ..¢ per sq. ft. for veneer to be selected by the architect.)*

(4c5) Samples of all figured veneers shall be submitted for approval.

(4d) Flush Door Inlays—

(4d1) Flush door inlays shall be standard design No. .. of *(Holly) (and) (Ebonized wood) (specify wood).*

(4d2) Flush door inlays shall be of special design *(in accordance with detail)* of *(specify wood). (Describe any special features not covered by detail.)*

(4e) Panels—Panels shall be .... thick .... ply.

Note: *See "Construction Standards," page 10.*

(4f) Stile and Rail Joints—

Note: *See "Doweled versus Mortised and Tenoned Construction," page 15.*

(4f1) Doweled Construction—Stiles and rails shall be doweled together with oak or birch dowels not less than ½ in. in diameter and 5 in. long driven into close fitting dowel holes accurately spaced not to exceed 2¼ in. O. C. Dowels shall be grooved lengthwise (4 grooves to the dowel) to facilitate complete glue contact.

(4f2) Mortise and Tenon Construction—Stiles and rails shall be mortised and tenoned together.

(4f3) Mortise and Tenon and Wedge Construction—Stiles and rails shall be mortised and tenoned and wedged together.

(4g) Splines—Furnish *(pine) (hardwood)* panel moulding splines. All mouldings shall be secured to splines and stiles and rails only—panels shall be loose.

Note: *See "Economy in the Design of Special Paneled Doors," page 16.*

(4h) Kiln Drying and Seasoning—All core and veneer stock shall be thoroughly kiln dried before fabrication. In addition all stiles and rails and all panels shall be kiln dried and seasoned to remove the excess moisture contained in the glue before assembling.

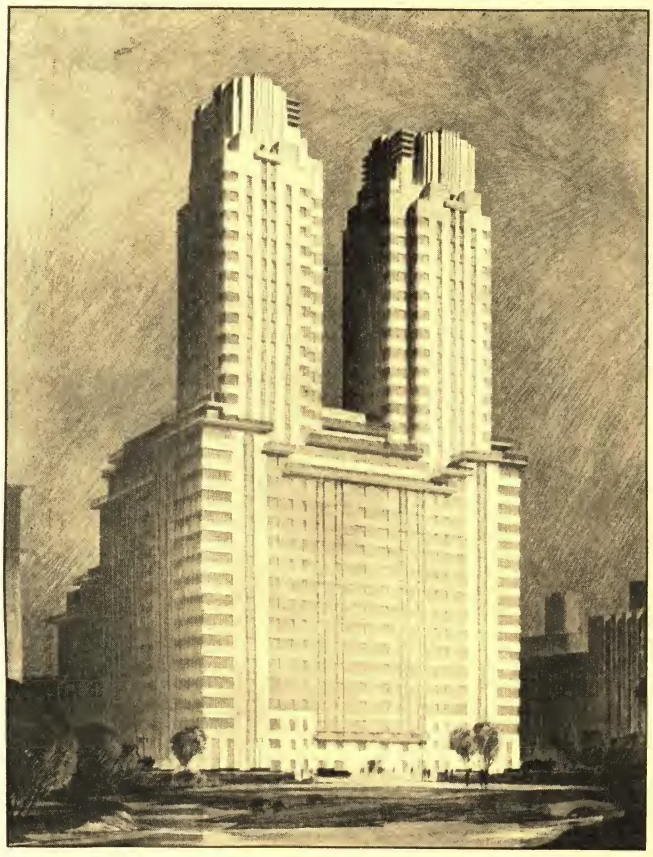
Note: *See "Construction Standards," pages 2, 10 and 11.*

(4i) Sanding—

Note: *See "Construction Standards," pages 2, 10 and 11.*

(4i1) All doors shall be machine sanded.

(4i2) All doors shall be *(belt) (hand)* sanded.



(5) Mill Fitting

Note: *Much expensive field labor can be saved if doors are machine trimmed to accurate net size. Swing or hands of doors must be furnished if lock side bevels are to be mill executed, together with templates of hardware. Give also the net clearance required from finished floor to bottom of door.*

(5a) The door manufacturer shall accurately mill fit to net dimensions all doors in accordance with the schedules to be furnished by *(the architect) (specify).*

(5b) This shall include accurate mortising for butts and locks to fit templates furnished by *(the architect) (specify).*

(5c) Protect all edges of mill fitted doors with wood strips tacked on to prevent damage in shipment, delivery and handling.

CARE OF VENEERED DOORS

Shipment and Inspection

A large percentage of our doors are shipped "In the White," without the first coat of filler or stain. The care which is taken in packing for shipment will protect them against damp atmospheric conditions. If doors are wet in transit through carelessness on the part of the railroad companies or as a result of leaky car roofs, the face veneers may blister and loosen. We, of course, cannot be held responsible for damage while in the hands of the transportation company, and for this reason it is important that all shipments from our factory be carefully inspected upon arrival at destination. If the doors have been damaged in transit by water or rough handling, the railway agent should be notified at once to inspect them, and to acknowledge damage with a notation on the expense bill, so that the claim may be collected from the railway company without undue delay. This should be done before the doors are removed from the car or station.

Storing and Finishing

When doors are received they should be stored in a dry building. Before the doors are taken to a newly constructed building, the plaster should be thoroughly dried out, using artificial heat if necessary, and the building entirely enclosed. We will not be responsible if our doors are stored or hung in a freshly plastered building. Unless the doors are to be stored in a dry warehouse, it is important that they be given a coat of filler, stain and shellac as soon as possible after unpacking. After they are finally fitted and hung they should, without fail, be given a coat of paint on the top and bottom edges. This will close the pores and prevent moisture entering. Much will depend upon the character of the work done by the painter as to whether or not doors will present an attractive appearance. No matter how beautiful the grain of the wood its appearance will be spoiled by poor finishing and we strongly advise against trying to economize by employing cheap labor and material in finishing your doors.

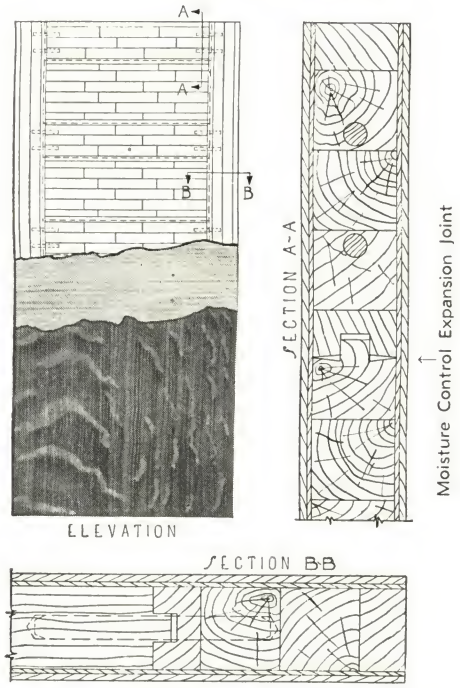
Products



ARCHITECTURAL WOODWORK of all kinds.

For "Takapart" Portable Partitions (patented), see Manufacturers' Index.

Facilities

Largest woodworking plant in the East devoted exclusively to special woodwork and doors, centrally located for prompt delivery. Skilled estimators and experienced draftsmen. Union workmen.

"No-Warp" Flush Doors

Details of "No-Warp" Door Construction

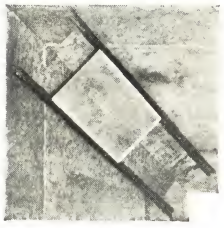
Cores—White pine (or chestnut), built up. Stiles and rails, with grain reversed, glued and doweled together forming a flush surface core with "Moisture Control Expansion Joints" (patent pending) between cross rails to control effects of humidity changes. Uniformly surfaced before veneering.

Veneers—Standard, 1/8-in. faces, 1/16-in. cross bandings. Other thicknesses optional. (We do not recommend thinner than 1/8-in. face veneers.)

Glue—Best grade, water-resistant. Veneers applied under 2500 lbs. hydraulic pressure.

Drying—*Very important*—Core blocks kiln-dried before assembling. After being cross-banded, doors are *kiln-dried* (an exclusive feature) before face veneering, removing all excess moisture absorbed during gluing. After veneering, doors are again kiln-dried, reducing the moisture content to the proper degree for service.

Data Sheets—Write for detail and data sheet.



Architectural Woodwork

It is difficult to list our products: frames, sash, doors, mouldings, cabinet work, stairs, etc., to special details and differing on every building as the architect wishes. The products represent unlimited variety.

Rose windows as in foreign cathedrals, English panelwork, mantels and beamed ceilings, Colonial rooms and other odd work are often produced by us. This makes our position unique in the woodwork field; a plant equal to the largest or most difficult contracts, where each order is a unit, maintaining its individuality. If it is made of wood, used in building, we can furnish it.

Keystone "Lock-joint" Erected Trim

With patented "Keystone Lock-joint Clamp" obtainable only from this company but used without extra cost on all our erected trim.

The "Keystone Lock-joint Clamp"

A spring steel clip with slightly convex face and acute angle flanges, is fitted into corresponding convex grooves, the metal clip spanning the miter. Inside each corner is a tightly fitted hardwood spline which is glued in, holding the surfaces of the trim on the same plane.

Being held by steel, Keystone "Lock-joint" Erected Trim is unaffected by climate, humidity or temperature and will never open up at the joints

INCORPORATED 1902

Manufacturers of Hardwood Doors, Pine Doors, Sash and Millwork

OSHKOSH, WISCONSIN

SALES OFFICES

BUFFALO, N. Y. BIRMINGHAM, ALA. CHICAGO, ILL. DALLAS, TEX. NEW YORK, N. Y. WASHINGTON, D. C.

Products

Special Doors of all kinds:
"Nu-Mold" Doors.
"Inner-Frame" Doors.
Flush Doors.
"Max-Royal" Stock Doors.
Pine Doors and Sash.
General Millwork.

We specialize on hardwood veneered doors. Our products are sold through independent jobbers, wholesale dealers and mills.

Resources and Facilities

A strictly modern plant with capacity in excess of 1200 doors per day. The best of heavy machinery designed to produce accurate workmanship. A crew of skilled mechanics and a minimum labor turnover. We welcome any investigation of our financial responsibility and integrity.

Guarantee

We unconditionally guarantee our product to be of first quality material carefully seasoned and well manufactured and will repair or replace any door or other product which within two years is shown to have been defective in either material or workmanship. We ask only the exercise of ordinary care in the storage and installation of our products.

Samples

On orders totalling 500 or more doors, if desired, a typical full size sample door will be furnished gratis for architects' approval before we manufacture the job. On smaller jobs such samples may be had at cost. Sample corners showing construction are always available.

Catalogues

Showing a full line of our products and details of construction may be had by writing our Oshkosh office.

Suggested Standard Specifications for Veneered Doors

Interior Doors shall be constructed of thoroughly seasoned materials redried by door manufacturer before assembly to a proper and uniform moisture content. All core material shall be of soft pine glued up of blocks not over 2 ins. wide on the face and joints in adjacent rows of core to be well staggered. Unless otherwise stated, exposed edges shall have a ¾-in. thick strip of the same wood as the face veneer. All veneers for stiles and rails shall be ⅛ in. thick before sanding unless otherwise noted. All glue used in the door construction must be a high grade vegetable or casein glue, equally distributed over the surface and applied under pressure before "chilling." Panels shall be three or five-ply as noted. All joints shall be assembled with *hardwood* spiral groove dowels not less than ⅝x5-in. joints 6 ins. or less in width to have two dowels with an additional dowel for each additional 3 ins. or fraction in width. All joints must be well fitted and all moulded edges smoothly machined. Unless otherwise noted, all doors shall be smoothly machine sanded with "0" sandpaper or finer.

The manufacturer's trade-mark or label shall appear on all doors. All doors shall be manufactured by approved manufacturers, such as ..... Co. ..... Co. or THE R. McMILLEN Co.

Exterior Doors shall be made to the same specifications, except that all veneers for stiles and rails shall be not less than ¼ in. thick before sanding and shall be applied with a high grade casein water-resistant glue.

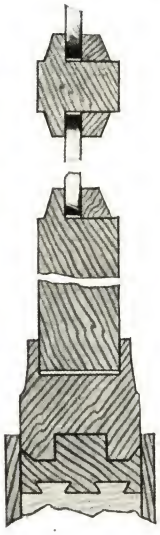
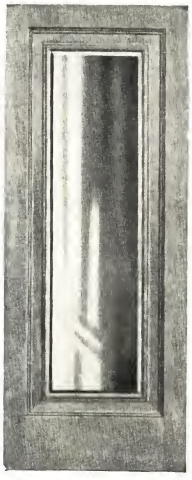
McMillen's Nu-Mold Hardwood Stock Door

McMILLEN'S
NU-MOLD
DOOR
With all the beauty of
A
FLUSH MOLDED
DOOR
But
None Of Its Disadvantages

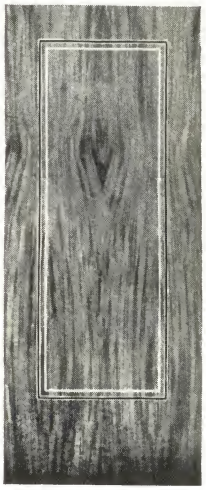
Full Size Detail of Nu-Mold Doors
Notice the heavy hand-molded effect—yet this costs no more than an ordinary door



Here is something decidedly new in fine door construction. A first quality hardwood stock door, having all the beauty of a flush molded door but none of its disadvantages. "There are no nailholes to disfigure the surface." The molding is coped, not mitered. The *joints can not open.* In addition to the two designs illustrated, Nu-Mold doors are made in other designs. Catalogue and layout measurements showing the complete line will be furnished on request.



McMillen's Improved "Inner-Frame" Doors



We show above a few of our Max-Royal designs of "Inner-Frame" Doors with details of their construction. Note that the moulding or "backband" is in *one solid piece.* There are *no nails or nailholes* on the face of the door.

Provision is made for shrinking or swelling so there can be no open joints. The mitre corners of the inner-frame are put together with *metal splines* which keep them permanently tight. Our catalogue gives a complete list of designs, layouts, etc.

McMillen's Slab Doors

These doors are constructed to give satisfaction.

They carry the same liberal guarantee as any other veneered door we manufacture.

Details of construction will be furnished on application.

McMillen's Distinctive Entrance Doors

Save you money and time. They are architecturally correct and distinctive in appearance. A wide choice of designs is available. Why detail a special door when these distinctive doors can be had at much lower cost?

The Troubleproof Door

Staunchly withstanding the severe tests to which they have been subjected, both in the laboratory and in actual use all over the world, Laminex doors have become famous as doors that will not shrink, swell, warp or come apart. Once properly hung, a Laminex door never needs to be refitted or planed down.

As the result of their performance in all weather and in all climates, Laminex dors have become standard equipment with thousands of architects for homes, apartments, hotels, hospitals, schools and commercial buildings.

The door that *stands* the famous WATER TEST!

Laminex Door Construction

The stiles and rails of a Laminex door are built up on a core of blocks dovetailed and jointed together with the grain so crossed that expansion and contraction are neutralized. Flawless face veneers are cemented *permanently* to the core with special formula Laminex cement which is waterproof and actually stronger than the wood itself. *Four* ⅝-in. dowels are used in each end of the bottom rails.

Stock Laminex doors are furnished in either flat or vertical grain stiles and rails.

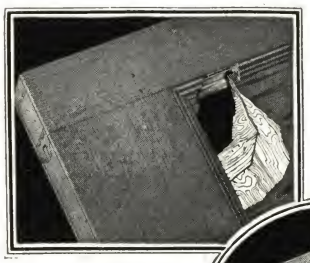
Standard Specifications (Douglas Fir Laminex)

All doors, unless otherwise indicated, shall be Douglas Fir Laminex, manufactured by THE WHEELER, OSGOOD COMPANY, Tacoma, Washington. Stiles and Rails shall be built up. Face Veneers shall be [flat] [vertical] grain cemented to cores with Laminex waterproof cement. Door panels to be rotary cut Douglas Fir, 3-ply, made up with Laminex waterproof cement. The doors when delivered to the job, shall bear the regular Laminex guarantee label and trade-mark.

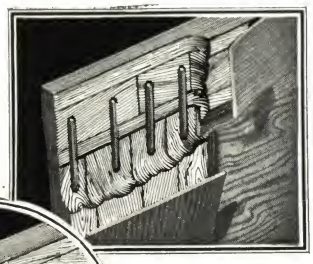
Left: Belle Porte Laminex. Either vertical or flat grain. Stiles and top rail 4 9/16 in.; bottom rail 9⅜ in.; insert frame vertical grain solid fir

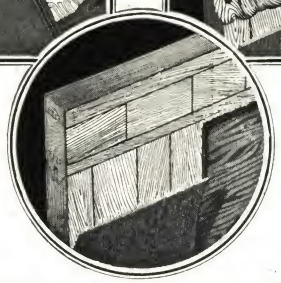
Left: Laminex No. 82. Either vertical or flat grain. Stiles and top rail 4 9/16 in.; lock rail 8 in.; bottom rail 9⅜ in.; bead and cove sticking

Right: Laminex No. 22. Either vertical or flat grain. Stiles and top rail 5⅜ in.; bottom rail 11⅜ in.; bead and cove sticking



Right: Laminex No. 66. Either vertical or flat grain. Stiles and top rail 4 9/16 in.; cross rail 4½ in.; lock rail 8 in.; bottom rail 9⅜ in.; muntins 4½ in.; bead and cove sticking





Laminex No. 829. Either vertical or flat grain. Stiles and top rail 4 9/16 in.; lock rail 4½ in.; bottom rail 9⅜ in.; bars ½ in. between glass; bead and cove sticking

Above: Clear 3-ply panels with grain crossed. They will not buckle or blister

Above: Oversize (⅝-in.) dowels—and one more than is used in the average door

Above: In the Laminex stile, separate blocks with grain crossed, counteract the tendency to warp

Laminex No. 1536. Either vertical or flat grain. Stiles and top rail 5⅜ in.; bottom rail 11⅜ in.; bars ½ in. between glass; glass beads tacked in; bead and cove sticking

PHILIPPINE LAMINEX DOORS

A Custom Built Door at Stock Door Prices

Architects and others interested in building fine homes and public buildings have demanded something new and attractive, yet practical, in doors and other millwork items. To meet these requirements, the Philippine Hardwood Laminex line of doors was developed, offering unlimited possibilities in designing attractive and modern interiors when planning new homes and other structures.

The slender, ribbon grain so characteristic of mahogany is present in Philippine Laminex doors, making them ideally suited for this class of work. Architects will be agreeably surprised at the exceedingly moderate cost of Philippine Laminex doors as they compare very favorably in price with domestic hardwood doors.

For Homes, Office Buildings, Hotels and Apartment Houses

Philippine Laminex doors are manufactured in scores of interesting and attractive stock patterns, all of which are architecturally correct.

One of the greatest advantages in using these doors is the fact that they may be finished in a variety of colors. All the shades from light walnut to deep dark red mahogany may be perfectly obtained with the proper stains. The secret of the beauty and the rich lustrous finish that these doors take lies in the super job of smoothing and the hard texture of the stock.

Doors and trim of Philippine Laminex are widely used for residences and buildings where cost is considered but not of prime importance, yet they are also quite within the reach of those building modest homes and where cost is a factor.

No. 507. A stock Philippine Laminex Entrance Door, one of a series of exceptional doors. These doors, with their close running, graceful ribbon grain add to the attractiveness of entrances.

Philippine Laminex Doors Manufactured to your Design and Specifications

A special department is ready to serve you and produce doors and trim of your detailed designs and specifications. Send plans and specifications to THE WHEELER, OSGOOD COMPANY, Tacoma, Washington, for estimate.

The Philippine Laminex Door Guarantee

In Philippine Laminex doors, you have unexcelled beauty and refinement combined with perfect performance. Laminex construction does away with the natural shrinking and swelling of wood, and eliminates the untold expense involved in rehanging and refitting warped or twisted doors. It puts an end to all door troubles and worries.

Every genuine Philippine Laminex door is guaranteed not to shrink, swell or warp, assuring you that you may safely specify these doors and be certain that they will give the service expected and to which you are entitled.

Standard Specifications (Philippine Hardwood Laminex)

All doors, unless otherwise specified, shall be Philippine Hardwood Laminex, manufactured by THE WHEELER, OSGOOD COMPANY, Tacoma, Washington. Stiles and rails shall be built up. Face veneers shall be ribbon grain cemented to cores with special Laminex waterproof cement. Door panels to be ribbon grain Philippine Laminex, 3-ply, made up with special Laminex waterproof cement. The doors when delivered to the job shall bear the Laminex guarantee label and trade-mark.

Products

"KORELOCK," "MIRACLE," "KLIMAX" and "MAPLEWOOD" DOORS.

We are one of the largest producers of Veneered Doors, both in stock and special design.

Our organization is equipped to handle doors in any quantity, any wood, any design.

"Korelock" Doors

These doors represent a construction that is used in the core of Veneered Doors that has proven satisfactory in all types of buildings in the United States, Canada, and foreign countries for thirty-five years.

"Miracle" Doors

These are a substile door introduced in 1921 and are made in all woods. They are endorsed by the entire building industry. Over three million "Miracle" Doors are in use today.

No door has been more widely imitated.

"Klimax" Doors

"Klimax" Doors are softwood stile and rail doors with hardwood panels, made in any combination of woods or designs.

"Maplewood" Doors

Flush Moulded Veneered Maple doors in a variety of designs at an extremely moderate price. These doors show the greatest variety of grain and figure of any of our commercial woods.

Specifications for Veneered Doors

All doors both exterior and interior, except metal and metal covered doors, shall be ..... (state kind of wood) Veneered Doors as manufactured by the PAINE LUMBER COMPANY, LTD., Oshkosh, Wisconsin.

Interior doors shall be .... in. thick with standard 1/8-in. veneer and of designs shown or noted.

Exterior doors shall be .... in. thick with .... in. veneer (not less than $\frac{3}{16}$ in.) and of designs as shown or noted. All doors shall be painted with a good grade of oil paint, top and bottom, to prevent absorption of moisture.

Guarantee

All doors furnished hereunder shall be guaranteed by the manufacturer who shall replace f.o.b. user's railroad station, any door which proves defective in material or workmanship. The manufacturer's trademark *shall be stamped on edge of door.*

THE COMPANY

Facilities and Resources

We own extensive timberlands, operate 25 miles of railroad, two sawmills and one of the largest plywood factories in the world, manufacturing our own timber into choice lumber and veneers for doors and plywood products.

Roddis Special Engineering Service

Roddis Engineering Staff will co-operate with architects and millmen on all blueprints, layouts, etc., so that special doors, wainscoting, paneling and Roddis Panelyte may be shipped to a job, each member of which will be numbered for its specific place in accordance with blueprints, making it possible to erect the highest type of millwork with a minimum of effort.

Roddis Finishing Service

Recognizing the importance of proper finishing, Roddis, more than 25 years ago, established a department for finishing and primer work. This department is equipped with modern machinery, handled by experts, and is designed to stain, fill and shellac doors and other interior woodwork. It is also equipped to apply primer coats of white lead and oil.

The work of varnishing should invariably be done at the job.

Too much emphasis cannot be placed upon the proper finishing of woodwork. The beauty of fine doors is often lost through the ignorance, carelessness or inability of the painter to apply the preliminary finishes properly. Often the painter is unable to correct conditions over which he has no control.

Doors which are properly cleaned and prepared at the factory are in prime condition for finishing. To expose the doors without any primer or protecting coats of finish to damp weather, dust and dirt, places a very difficult task on the painter at the job and is very expensive.

We especially recommend that inlaid doors which are to be stained should have this done before inlaying so as to insure against any creeping. This results in an inlay which is both clear and well defined.

Our charges for staining, filling and shellacing are very low and insure first class work. We estimate that 75% of our doors going into the Eastern territory of the United States are given the preliminary coats at our plant. The importance of doing this work before shipping has become generally recognized.

Consult our Finishing Department. Submit samples of any finish you wish and Roddis craftsmen will give you an ideal match. Write for the Roddis color chart.

Bulletins and Architectural Data

A complete series of bulletins will be mailed upon request, covering full data and dimensions of all standard and special purpose Roddis Flush Doors, Roddis Custom Built Panel Doors, Roddis Marine Plywood, Roddis Panelyte, and Roddis Aerowood. All bulletins are designed for use in A.I.A. standard binders. Current bulletins showing complete installations are published from time to time and will be sent to those architects and mills whose names are listed.

Complete detailed specifications for all Roddis products will be gladly furnished to architects, either from Marshfield or our local distributors.

Roddis Waterproof Glue

In the Roddis laboratories, among other things, has been developed a casein glue, for which we have yet to find an equal. The reason for this high quality glue is that Roddis being located in the heart of the dairy section of the United States has available the highest grade casein in the world. From these caseins has been developed a wet mixed glue that tests from 50% to 75% higher than any of the commercial casein glues on the market.

It is a known fact throughout the glue industry that a wet mixed glue is superior to dry mixed, but it is not practical to manufacture for sale such a glue, as it would set up before being ready to use. Therefore, regular manufacturers must use a dry mixed glue or expose their formula. It is very evident that Roddis has the advantage in this situation which is the cause of such exceptionally high standing waterproof glue materials. The bond is so good that when galvanized metal is glued to wood, the galvanizing will tear long before the glue will give.

Proper Thickness of Face Veneers

For all interior doors, we recommend face veneers approximately $\frac{1}{16}$ inch thick. This thickness prevents glue staining and gives a most satisfactory bond. The accompanying table of shear tests, prepared by Roddis engineers, clearly demonstrates the importance and strength of thin veneers, which allow for a more thorough penetration of glue.

For exterior doors, which are exposed to the weather and do not require a fine finish, heavy veneers have been found to be most practical and for this type of door we recommend a thickness of not less than ⅛-in. veneer. This applies only to the exterior doors which do not require the finishing that an interior door requires, and this point should be clearly understood as the thin veneer should always be used where fine finishing is required.

Roddis casein glue is insensible to heat or cold or humidifying influences. Thick veneers are not held as firmly and, in spite of the glue bond, move at the exposed surface with the result that doors made up with thick veneers invariably show open joints which eventually mar the appearance and otherwise unfavorably affect the usefulness of the door.

We are aware of the fact that it is a common belief that heavy face veneers are required in order to make a good, sound door and that the heavier the veneer, the better the door. This very common idea is disproven by the table below, which shows conclusively that if a fine finish is required, the practice of thin face veneers must be adhered to. The only limitation on the thinness of the veneer must be its practicability and the avoidance of glue stain; experience points to the durability and permanence of thin veneers which, held firmly by the glue, prevent reaction by the wood to atmospheric influences.

As will be noted, as the thickness increases, the strength of the test decreases. Also, where material is listed as 3 and 5 ply, 5 ply is the stronger. This is explained as follows: On ¼-in. 3-ply plywood the center stock was made $\frac{3}{32}$-in. thick whereas on ¼-in. 5-ply the center stock was thinner to permit the extra two plies. It would not be practical in the construction of veneered doors or tabletops to use a construction such as 1/24-in. 3-ply which means that each sheet of veneer must be .01 thick. However, the point is clearly shown that the $\frac{1}{16}$-in. veneer gives a much greater strength in bond than ¼-in veneer and at the same time is heavy enough to eliminate or prevent staining from glue penetration. The fact is that heavy veneers eventually destroy themselves in the door.

SHEAR TEST ON GLUE BOND

Thickness, in.	In pounds	Per square inches	
	Ply	Dry	Wet
$\frac{1}{24}$	3	480	283
$\frac{1}{16}$	3	423	250
$\frac{3}{32}$	3	420	253
$\frac{3}{16}$	3	336	224
¼	3	333	263
¼	5	392	209
$\frac{3}{8}$	5	321	204

No. 431

RODDIS STERLING FLUSH DOORS

Merits—Roddis Doors are sanitary, sound and fire-resistant. Heat, cold, dampness, water or steam has little effect on them. They are furnished with surface veneer of any desired wood and inlaid as specified. The unbroken surface of natural wood provides great beauty which is of important decorative value.

Materials—We control every step in the production of Roddis Flush Doors. Material for the cores come from our own timber tracts, through our sawmills, and its proper seasoning and drying is under our scientific direction. Only this specially prepared wood enters the cores; no waste or odd scrap material is used.

Veneers—Unless otherwise specified, $\frac{1}{16}$-in. veneer is used on all doors. Long experience proves the correctness of this specification. Please note paragraphs in regard to the proper thickness of face veneers on page 2.

Waterproof Glue—All Roddis Doors are glued with casein waterproof glue of our own manufacture. Please note paragraph in regard to Roddis glue on page 2.

Guarantee—Every Roddis Sterling Flush Door is guaranteed for two years as to workmanship and material.

Endorsement—Roddis Flush Doors are in service in thousands of prominent buildings in all sections of the country. Highly endorsed by leading architects for hotels, hospitals, schools, clubs, apartments, public and office buildings, and better class homes. To any architect unfamiliar with Roddis Doors, a comprehensive list of such endorsements will gladly be submitted.

SPECIFICATIONS

All doors shall be laminated 5-ply flush veneered doors without panel—as manufactured by Roddis Lumber and Veneer Co., Marshfield, Wisconsin.

These doors shall be of thickness specified by the architect and constructed as follows: cores built up of self-reinforcing, varying length narrow strips of fully seasoned, dried softwood, glued together; core to be double veneered with two $\frac{1}{16}$-in. hardwood veneers on each side, glued on and thoroughly dried; the first veneer to have grain running crosswise and the second, or surface veneer, with grain running lengthwise. The first (or crossbanding) veneer shall run full to the four edges of the door. Top and bottom of door, as well as the two side edges, shall be banded with a hardwood edgestrip $\frac{3}{4}$-in. thick and glued to the core.

All glue used on these doors shall be Roddis waterproof glue.

Each door delivered shall be fully guaranteed by the manufacturer as to construction according to this specification and against defect in material or workmanship.

All inlaid doors shall be stained before inlaying with approved color to prevent staining of inlay. Doors are to be given one coat of shellac after inlaying and before shipping, to protect same. All doors to be carefully crated or packed in car, and delivered subject to the approval of the architect.

(We recommend that the paragraph relating to staining and shellacking be changed so as to include all doors, whether inlaid or not.)

Note: Standard Sizes of Roddis Flush Doors are carried in stock at Marshfield and by all Roddis warehouses—See list on page 10.

- Doors With Special Lights—One to Eight Lights, Etc.

Type "R-302" Door
Unselected Birch. With observation opening. Designed for use in all instances where window in door is desired. The opening can be of any size or shape required for any given purpose. It can be finished and inlaid as desired.

THE RODDIS X-RAY DOOR

The Roddis X-Ray Door was designed for this company by a prominent architect specializing in hospital buildings. This door functions the same as other X-Ray doors—but is not as heavy, awkward or unsightly as are other doors of its type. The Roddis X-Ray door is equipped with a thick continuous sheet of lead down the center of the door, which is bolted and securely held in position with lead-covered bolts, as shown in the upper left hand drawing on this page.

In every other respect this door follows the fundamental Roddis design and construction, having the same inner core, the usual cross band veneer and surface veneer and the protecting hardwood edge-strips all around. The surface veneer is furnished and finished as specified—for veneer, color, grain, etc., and provides every beauty of appearance for the X-Ray room and in full conformity with the hospital's interior architecture. The Roddis X-Ray Door is used quite generally in hospitals throughout the United States, and is highly recommended as the most desirable and satisfactory door for the X-Ray Room.

RODDIS FINE RESIDENCE DOORS

Roddis Fine Residence Doors are custom made, special to order, yet with stock door delivery. They are of Roddis Flush Door construction, and are adaptable to any architecture or design of interior because of the artistic effects possible by special inlays of rare woods attractively matched. Roddis has an international reputation for leadership in artistry of woods and ingenuity of craftsmanship as accomplished in residence doors, and probably is the only company completely equipped to supply doors of such quality and service. There are many possibilities of design available, with inlays entirely within the taste and judgment of the buyer, allowing for specific requirements and originality without limit.

ECONOMICAL IN COST

Although Roddis fine residence doors are used in many of the finest homes in the country (names on request), these doors of beautiful rare woods and exclusive design are obtainable at exceptionally low prices so that the most modest dwelling is likewise able to have the exquisite individuality and beauty of this Roddis quality.

NO-TRIM ECONOMY

Another economy is possible in that no special trim is necessary. Good results are obtained by eliminating the trim about the door jamb, allowing the plastered wall to form a background for the rare woods. This accords with American thought and design, and forms a most pleasing contrast with the beautiful figured woods.

For example: If Walnut, Mahogany or Birch is used for the door a sound wood trim such as Pine, Basswood, Gum, etc., is used enameled an eggshell gloss white, or painted any other desired shade. With Maple doors a simple trim of inexpensive design in plain Maple is recommended.

The effects accomplished by the artistic arrangement of rare woods and inlays, from beautiful plain to the ultra futuristic designs, are obtaining an ever increasing demand for Roddis fine residence doors in all parts of America. More details sent on request, including special residence door brochure.

RODDIS WAINSCOTING

With Special Features of Engineering Service

Roddis has better than 400,000 sq. ft. of floor surface, 300 skilled mechanics, the most expensive glue presses in the country, and prompt delivery is available for the most difficult work.

Our Engineering Service permits you to receive all the wainscoting marked and numbered in the same manner as structural steel, reducing to a minimum the time required for installation and eliminating the necessity for skilled mechanics to erect the wainscoting. No sizes of panels are too difficult to manufacture, we having manufactured panels as long as 25 feet and some 22 feet one-piece veneer. Bent work is equally as efficiently handled.

Most unusual opportunities are now given the architect and engineer in the use of the beautiful veneers and woods. More than 75 rare woods are available and the effects obtained are almost without number. Avail yourself of this service offered by Roddis. Consult our engineers on your next installation.

Roddis paneling, combining the best of construction with a leading selection of rare woods, makes a wainscoting unsurpassed in its beauty and appeal.

Dave Gilbert, Inc., Fort Worth, Tex.

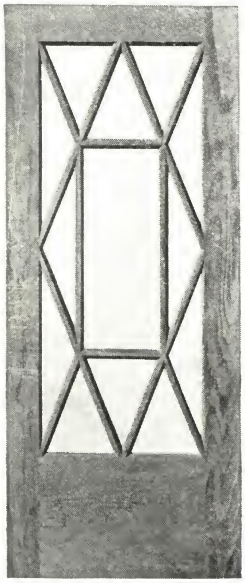
RODDIS CUSTOM BUILT DOORS

It has always been the aim of the Roddis Lumber and Veneer Co. to assist and serve the architect in every way possible. This feature of Roddis policy has helped establish for Roddis the splendid reputation it now enjoys with recognized leaders in the architectural field.

Every Roddis manufacturing and designing facility is at the command of the architect to help him better serve and please his client. He is cordially invited to use these resources to his advantage.

The Custom-Built Door gives the architect exactly the door he wants at a reasonable price, delivered on short notice. Roddis has solved the problem of combining *individual* design with *standard production* and offers the Custom-Built Door as an outstanding achievement in door manufacture. The Custom-Built Door by Roddis is truly made to order. The architect has utmost freedom in design, faithfully executed by Roddis in a plant famed the world over for fine doors.

C. B. 103



C. B. 101

GENERAL DESIGN

No limitations are imposed by Roddis in the design of the Custom-Built Door. It may be made in any size and finished in any veneers or combinations. One panel doors, one panel and one light, two panels and one light or one long light, are among the variations that may be employed. Like all doors built by Roddis, the Custom-Built employs those principles of construction that assure permanence. The Roddis guarantee is based on perfect materials and workmanship and complete satisfaction.

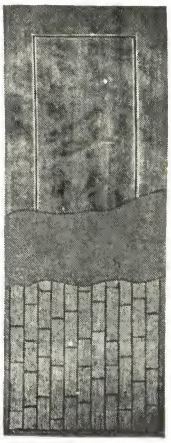
WEAVER DOR-VENT DOOR DETAIL

DOR-VENT DOORS

Furnished by Roddis Completely Equipped

(See Open Vent View Page 4.)

The Dor-Vent door is standard and can be had in any type Roddis door shown in the Roddis catalog, sent on request. The Dor-Vent equipment includes hinges, lock, closer and screws, which are fitted completely to Roddis doors in the Roddis factory before delivery.



Add Beauty—because they are of a most artistic proportion, follow correct architectural lines and have no attachments foreign to the appearance of a regular door. The top tilting panel or sash operates on two collapsible metal hinges. This panel does not strike the wall when the door is opened, but automatically and quietly closes into place in the door; when the door is closed again the vent panel lowers and opens gradually, smoothly and noiselessly.

Give Greater Utility—The principle of ventilation is correct because the Dor-Vent unit is near the ceiling where foul air can pass out or fresh air in. The ventilating area is unobstructed by slats, which affords much more efficient ventilation than a larger obstructed area. The Dor-Vent hinges open or close the tilting panel by finger-tip effort which is a decided improvement over squeaking, jamming transom lifts.

Save Money—over the cost of a door and a transom because the top panel of the door is used in place of the transom. The Dor-Vent hinges cost less than the transom hardware, the casings, jambs and labor required to install the same. The space saved by the elimination of a transom represents a 12½% saving in cost usually required for wall materials for the space.

Ventilation is of first importance in many parts of the United States and is important everywhere. For appearance, utility and economy, we recommend the Dor-Vent. Write for our Dor-Vent folder describing this new and valuable invention.

RODDIS FLUSH DOOR DETAIL CONSTRUCTION

Core of Softwood Blocks

Uneven in lengths to equalize and absorb any tendency to shrink or swell; and cemented together into one integral unit by a special Roddis-compounded waterproof glue and thoroughly dried; providing a core of unchangeable shape and size, solid and strong yet not of heavy weight

¾-in. Hardwood Edge Strips Completely Around the Core—Top, Bottom and Both Side Edges

Securely seal and protect the core from moisture. The only door made with hardwood edge strip on all four edges as standard construction, which is a noteworthy Roddis Flush Door distinction

1/16-in. Cross-band Veneer

On both faces of door, glued to the core and thoroughly dried—complete hardwood closure for the softwood core. The grain of this veneer runs crosswise, to prevent lateral warpage and further reinforce the door's stability

1/16-in. Hardwood Surface Veneer on Both Faces of Door, Over Crossband Veneer

Cemented with Roddis process waterproof glue and thoroughly dried. Surface veneer grain runs the long way, opposite to crossband grain, and reinforces tensile strength and rigidity of the door

RODDIS PANELYTE

Same Purpose as Marble, Wood Paneling, Structural Glass, Enameled Metal

New Development

The combined resources of two leading manufacturers of America—Panelyte Corporation of New York City and Roddis Lumber & Veneer Company of Marshfield, Wisconsin—now offer to the public a new product, a superior plywood with an everlasting surface, Roddis Panelyte.

Panelyte is a face of resinous substance, approximately $\frac{1}{16}$-inch thick, cemented to Roddiswood, metal, asbestos or composition board, and known as Roddis Panelyte. The resinous surface is very hard and dense, practically inert chemically, and is not injured by gasoline, benzol, alcohol or ordinary acids and alkali, resisting high and low temperatures.

Roddis Panelyte may be used for the same purposes as marble, wood paneling, structural glass and enameled metal.

Roddis Panelyte's Many Uses

Roddis Panelyte can be employed for:

(1) Soda fountain bars and tables.
(2) Restaurant table tops.
(3) Tops for club, office and hotel furniture.
(4) Refrigerators.
(5) Kitchen cabinets and sinks.
(6) Store fronts and show case baseboards.
(7) Deal plates, kick and push plates.
(8) Wall Paneling and wainscoting.
(9) Card table tops.
(10) Steamship interiors.
(11) Bank interiors.
(12) Mop boards.
(13) Interior trim.
(14) Restaurant and soda fountain booths.
(15) Outdoor furniture.
(16) Laboratory equipment.
(17) Elevator cabs.

Qualities, Sizes, Characteristics and Designs

The characteristics which make Roddis Panelyte so superior are:

(1) Heat does not affect the surface up to 350° F.
(2) Erection can be done by carpenters.
(3) Does not stain.
(4) Does not chip or crack.
(5) Easily cleaned.
(6) Ordinary acids and alkali have no effect upon it.
(7) Waterproof.
(8) Delivery can be made in a short time.

Roddis Panelyte may be obtained in many designs, such as Burl Walnut, Verde Antique Marble, Black and Gold Marble, and flat colors and decorative designs.

Roddis Panelyte is available in the following sizes:

36x36 in.	48x60 in.
36x48 in.	72x48 in.
36x72 in.	48x120 in.

The thickness of the finished product is dependent upon its intended use and may vary from ⅛ inch to 2 inches or thicker, if desired.

Our Engineering Service is at your command. Simply put your problem up to your nearest distributor or write direct to our main office at Marshfield, Wis.

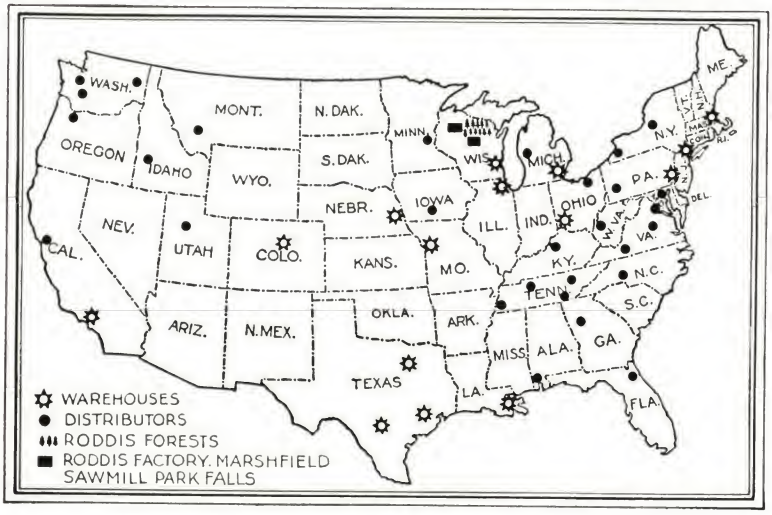
RODDIS METALFACE PLYWOOD

With the ever increasing demand for metal covered plywood, our Research Department, after extensive development work, has produced a metal clad plywood which, we believe, is superior to any on the market at the present time. This opinion is substantiated by the following comparative tests with the product of several of the leading competing metal clad plywood manufacturers. Samples Nos. 3 and 4 are the product of the same manufacturer. Otherwise, each sample represents the product of a well-known, advertised brand of metal-covered plywood.

SHEAR TEST IN POUNDS PER SQ. IN.

Description	Dry	Wet
Sample No. 1.....	50	Too small to record
Sample No. 2.....	211	64
Sample No. 3.....	200	80
Sample No. 4.....	290	93
Roddis Metalface....	429	168

The shear test is made in accordance with the Government airplane specifications and shows the strength of the glue bond between the metal and the wood. The dry test is made after the stock is completely ready for shipping, and the wet test is made from samples submerged in water 48 hours and tested wet.



In other words, Roddis Metalface is from 50% to 60% higher in shear test than any of the competitive samples tested. Also, it tests better than the general requirement of the Government airplane plywood stock, which is 300 lbs. dry and 160 lbs. wet.

Another feature of Roddis Metalface is the fact that it will stand heat up to better than 250 degrees F. The metal used is a special figured galvanized steel which will take any sort of finish, lacquer, etc., without any additional work.

The reason for such a far superior metal clad plywood is that we have fortunately discovered a secret process which gives us a bond actually superior to the bond between the galvanizing and the steel.

Samples and prices furnished upon request.

Carved Wood Mouldings, Ropes and Beads

For wall paneling, cornices, shelf edging, interior and exterior trim. Ropes cut rights and lefts and beads furnished full round, half round, quarter round, three-quarter round and flat side, and in various diameters. Patterns clean-cut in kiln-dried wood. Mouldings made in various sizes and widths. Many stock patterns for immediate shipment. Hundreds of other patterns can be made promptly.

Your own designs can be made up quickly to your specifications.

Twist Work

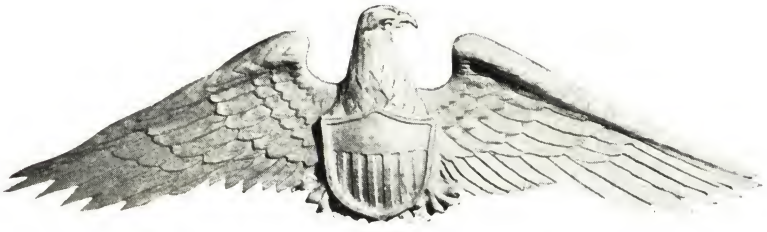
For balusters, newels, columns, etc. Furnished in period styles. Stranded, hollow, roped or open, as desired. Illustrations furnished on designs already made.

Your own designs made up without delay.

Wood Turnings, Rosettes and Ornaments

For drops, balusters, finials, etc. Made to your specifications or furnished from patterns already made. A complete line of rosettes and ornaments—stock designs—from which to make selection.

Wood Carving



We maintain a complete service for wood carvings of every type—carvings produced by hand, spindle or multiple machine as required by the specifications of the job.

Samples, Illustrations and Prices

Samples of mouldings, ropes, beads, rosettes and ornaments can be furnished promptly on request. Illustrations of larger work in designs already made will be sent and prices given on special work or on any quantity of stock patterns.

Correspondence Invited

The Klise plant is capable of handling any size job. It is staffed by high class craftsmen and always gives good service to meet building demands and dates. Correspondence is invited—specifications will be given immediate attention.

CINCINNATI, OHIO, St. Bernard—Fancy Veneer and Lumber, Domestic and Foreign

EQUIPPED TO SUPPLY EVERY NEED OF THE ARCHITECT

American Walnut Timber

Carefully selected from first quality stock, obtained from the region of the best stands of Walnut Timber. Modern equipment and facilities in our plant for conversion, a skillful corps of workmen, and more than fifty years' experience of our supervising staff, is the guarantee for the high quality of our complete and diversified stock of Walnut lumber.

With a well-organized Service Department, our business is operated for the purpose of supplying every need of the market at competitive prices. The heart of our entire organization is in our work, and being recognized as the largest manufacturers of American Walnut, we are in a position to satisfy any of your requirements of lumber for interior trim, flooring and other sorts of woodwork.

American Walnut Veneer

We carry a complete stock of rotary, half-round, back cut, sliced, quartered, bastard and flat cut, stumps, butt, crotch and burl veneer of beautiful figure effects and of various colors and shades, carefully manufactured from the very choicest material. In our stocks you will

find many trees, whose grain and markings will suggest new conceptions of design that will inspire the best of creative effort.

Advantages of American Walnut

American Walnut is the king of decorative woods because of its unsurpassed natural beauty, for its valuable properties of holding its place, resistance to decay and abuse, its excellent blending and finishing qualities, its exceptional variety of figure effects and dignified color. When made up into panels and trim it adds more value to the room than its original cost. It is inexpensive in maintenance and retains its mellow, beautiful effects for ages. It combines economy with beauty, giving lasting satisfaction to the architect as well as the owner.

Our stock of veneer is cut from selected logs and runs, therefore, unusually clear. The texture is firm and the wood takes a splendid finish.

AMERICAN PLYWOOD CORPORATION

Manufacturers of Plywood

NEW LONDON, WISCONSIN

Responsibility

We refer you to Dun's and Bradstreet's.

Facilities

We operate one of the largest plants devoted to the manufacture of high grade plywood. Our veneers are cut at our own veneer cutting plants at New London, Wisconsin, and Montgomery, Alabama. Since we started operating over ten years ago we have continually improved our plant and it is today equipped with the most modern machinery and laid out in a systematic manner. During the past 10 years we have manufactured over fifty million feet of high grade plywood for wainscoting, furniture, cabinets, yachts, ships, automobiles, airplanes, and other special purposes.

Ply-Rite

PLY-RITE, THE "PLYWOOD OF RECOGNIZED QUALITY"

Standard (Stock) Sizes

Available in 3-ply ¼-in., 5-ply ⅜-in., 5-ply ½-in., and 5-ply $\frac{13}{16}$ in., 24, 30, and 36 ins. wide, 48, 60, 72, 84, and 96 ins. long, and also in 5-ply $\frac{13}{16}$-in., 144 and 120 ins. wide, 42, 36, and 28 ins. long.

Custom Sizes

Manufactured to your order in practically any size, such as 120x192 ins. and even up to 22 ft. long in any number of plies and thicknesses from 3-ply $\frac{1}{16}$-in. up.

Wainscoting

Should be custom built to get the utmost in perfection. We have the facilities, experience and ability and are constantly putting them to use in the manufacture of plywood wainscoting for fine buildings. Architect's details are carefully followed. Panels are matched consecutively from the log flitches and each panel numbered so that it can be installed in the proper sequence.

Woods

We manufacture from the log all of the domestic veneers going into our plywood. In some woods where long logs can be obtained we are able to produce veneer as long as 22 ft. in one piece for length. This is especially desirable for certain effects in high-ceiling rooms.

We have produced plywood in over one hundred different foreign and domestic woods and can give complete information as to the thickness of veneers and sizes available.

When Specifying

Advise your bidders that satisfactory plywood can be obtained from the AMERICAN PLYWOOD CORPORATION. We will be pleased to have architects consult us or ask that some one in our organization call on them. We will be especially pleased to have architects visit our plants.

THE ASSOCIATION

A non-profit organization of all United States manufacturers of Douglas Fir Plywood, founded to sponsor a continuing program of research, to promote the use of this material in construction and industry, and to help users employ it to the best advantage.

Inquiries as to the characteristics or uses of Douglas Fir Plywood will receive the prompt attention of our Research Bureau. Address DOUGLAS FIR PLYWOOD MANUFACTURERS, *Skinner Building, Seattle, Wash., or any of the above mills.*

The Product

(Test data on pages 10 to 12, inclusive.)

Douglas Fir Plywood consists of three or more rotary-cut and individually dried sheets of Douglas Fir, glued together cross-grain under hydraulic pressure. The water-resistant glue used forms a bond of high shear test, stronger than the wood fibers themselves, and the cross-grain lamination approximately equalizes the strength of the resulting panel in both directions.

Douglas Fir is the name commonly applied to the tree species Pseudotsuga Taxifolia. This tree grows on the Pacific slope, where the climatic conditions produce a wood of soft texture combined with great strength. For this reason, and because of its unusually light weight, Douglas Fir lumber is widely specified by engineers for heavy structural timbers.

In the manufacture of Douglas Fir Plywood, only the choicest Douglas Fir logs are used. These are the so-called "peeler" logs, which are less than 1% of the total production of Douglas Fir logs.

DOUGLAS FIR PLYWOOD

REAL LUMBER
Engineered for greater size and strength

Combines Lumber and Wallboard Advantages

Therefore Douglas Fir Plywood possesses all the advantages of the very finest Douglas Fir lumber—because it *is* lumber—yet it is available in convenient "wallboard" sizes and has far greater structural strength than either lumber or wallboard.

It comes in a wide variety of standard widths and lengths—up to 4x8 feet—and in standard thicknesses from $\frac{3}{16}$-inch 3-ply to $1\frac{3}{16}$-inch 7-ply. Thus waste can be minimized by selection of just the right size for the particular need.

Douglas Fir Plywood is economical because it is most inexpensive of all plywoods, actually costing less *per surface foot* than ordinary lumber. Moreover, its light weight and wide range of large sizes make possible savings of 10% to 60% in handling and labor costs.

Available Throughout the United States

The great majority of building material dealers stock Douglas Fir Plywood, in an assortment of sizes and grades.

Price

Although the price of Douglas Fir Plywood varies somewhat in different localities—because of varying freight rates, quantities ordered, etc.—it should retail at little if any more than the price of fiber substitutes.

Physical Characteristics

Comprehensive tests are in progress to determine in the fullest detail both the physical properties of Douglas Fir Plywood and its performance in specific uses. Data resulting from the first series of these tests are shown on pages 10 to 12, inclusive.

The light weight of Douglas Fir Plywood is demonstrated by the fact that a cubic foot of ⅜-inch 3-ply, for example, weighs only 34 pounds. The specific gravity is .55.

Because of this, and because of its laminated, cross-grain construction, Douglas Fir Plywood is very much stronger than steel, pound for pound.

Strength Approximately Equalized in Both Directions

Whereas the tensile strength of ordinary lumber may be twenty times as high parallel to the grain as across it, and the modulus of elasticity from fifteen to twenty times as high, in plywood they are nearly equal in both dimensions. Similarly, the shear strength of plywood is almost the same parallel to as across the grain.

Because of this nearly equalized strength, there is no plane of cleavage. Hence plywood cannot be split except by extraordinary force. It is virtually impossible to split even a small piece with a hatchet or axe.

Its approximately equalized shear strength allows nails and screws to be placed close to the edge without danger of splitting.

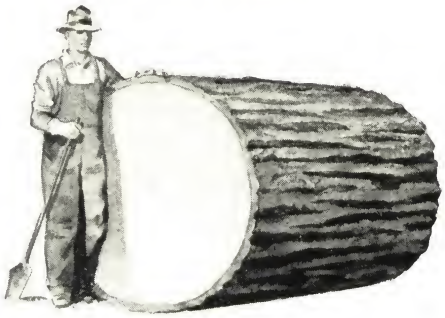
Highly Resistant to Warping, Shrinking and Expanding

As each ply is dried before the gluing process, and as any tendency of the individual plies to shrink or expand is prevented by the cross-grain construction, plywood is extraordinarily resistant to shrinkage and expansion. Once in place, it will never warp.

Because even a thin plywood panel possesses such great strength, it can be used as a facing in positions that would not allow the extra projection of solid wood.

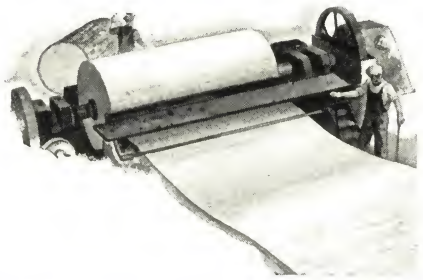
Plywood is available already sanded to a satin-smooth finish, thus reducing labor costs at the point of construction.

Finishing Properties



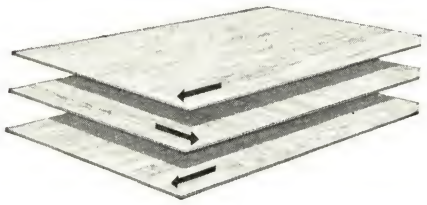
Douglas Fir Plywood will take any wood finish and lends itself admirably to a multiplicity of decorative treatments. It can be stained, waxed, painted, enameled, or lacquered, and it serves as a base for plastic paint.

For fine lacquering and enamel work, it is well to treat the plywood first with one part of commercial shellac combined with six to eight parts of wood alcohol. This thin shellac penetrates the wood without leaving a heavy crust such as sometimes causes enamel and lacquer finishes to check and flake. The surface should be well sanded with No. 00 sandpaper between the coats of lacquer or enamel.



If the edges are to be exposed, they should be sanded smooth, and then covered thinly with putty or some similar plastic material.

If the plywood is to be exposed to weather, three good coats of a high grade paint or spar varnish should be applied. An undercoat of aluminum paint is an excellent protection.



HOW DOUGLAS FIR PLYWOOD IS MADE

1 **Selected Douglas fir logs are cut to length and barked.**

2 **Then turned on a giant lathe and peeled off into endless lengths of thin wood sheets.**

3 **These sheets of wood are cut to size, laid cross-grain, and glued together flat with water-resistant glue under hydraulic pressure.** ***(Arrows show direction of grain.)***

4 **The result is a new and better lumber having all the good qualities of natural wood plus the size and convenience of wallboard—but with advantages of strength, stiffness, and freedom-from-splitting which neither lumber nor wallboard has.**

Standard Sizes

Standard Widths: Beginning at 12 inches, increasing by 2-inch units to 48 inches.

Standard Lengths: 48, 60, 72, 84 and 96 inches.

Standard Thicknesses: Beginning at $\frac{3}{16}$-inch 3-ply, increasing by $\frac{1}{16}$-inch units to $1\frac{3}{16}$-inch 7-ply or thicker on special order.

Standard Grades

Good 2 Sides—Suitable for the very finest construction in which both sides are to be exposed. This grade will take either natural or stained finishes beautifully.

Good 1 Side—Ideal for all purposes requiring exposure of only one side. The side to be exposed is fully equal to the standard of the Good 2 Sides grade. The other surface is perfectly sound, but may be made up of two or more pieces of veneer neatly jointed and taped.*

Sound 2 Sides—This grade presents a sound surface on both sides, but may show some natural discoloration. One face may be taped,* but any defects on either side are neatly repaired and both surfaces are suitable for painting.

Unselected—This grade is intended for utility use, such as cut-up work, for which strength but not an absolutely sound surface is required. One face may be neatly taped.*

Wallboard—While either face may be taped* the exposed face is perfectly sound.

**Note:* *By "taping" is meant the mechanical joining together of unglued veneer sheets to hold them in place during the gluing process. No trace of this operation remains on the finished panel. Even the most expensive hardwood panels always have taped surfaces.*

Representative Uses

A product offering so many advantages naturally is being put to hundreds of uses, both in construction and in industry. Space does not permit mention of more than a few of these, but the construction uses listed here are representative of the extent to which Douglas Fir Plywood's economies, and its remarkable strength, light weight, resistance to warping and splitting, ready workability, and nail-and-screw-holding properties, have commanded acceptance.

Subflooring

Douglas Fir Plywood is attracting wide attention among architects and builders for this use. Its large sizes save as much as 60% in the cost of labor, and it practically eliminates air leakage.

Insulation is greater, not only because Douglas Fir Plywood has a considerably lower heat conductivity than ordinary lumber, but also because the total lineal footage of joints is greatly reduced. These joints, unlike those left by ordinary subflooring, are tight. And they *remain* tight because Douglas Fir Plywood will not shrink or expand.

A further important advantage of Douglas Fir Plywood for this use is that it minimizes squeaks. It does not yield to the weight of a person walking, as do ordinary floors.

The ¾-in. 5-ply thickness is most commonly used for this purpose, although the exact thickness depends on the particular need.

For floors that are to be entirely covered by carpet or linoleum, 5-ply Douglas Fir Plywood can be used as the flooring itself. Such floors can be soundproofed, as well as made resilient, by placing upon the subfloor a layer of deadening material, upon which rest sleepers.

Sheathing

For virtually these same reasons, Douglas Fir Plywood is ideal for sheathing. It contributes great structural strength to the building, and the big panels enable carpenters to cover large areas quickly, requiring very little nailing as compared with ordinary lumber. For sheathing, as for subflooring, Douglas Fir Plywood saves approximately 60% in labor costs.

The ¾-in. 5-ply thickness is most used for sheathing, largely because it permits the use of standard-width door and window jambs.

For this use, too, Douglas Fir Plywood offers a minimum of joints, and such joints as there are, are permanently tight. This, coupled with the low heat conductivity of the material, assure a high degree of insulation.

Douglas Fir Plywood Used As Sheathing

Note the few joints as compared with shiplap or boards. These few joints are on bearing studs.

Used for Walls and Ceilings

Douglas Fir Plywood nailed directly on the studding and joists. The finish is a lead and oil paint. Note the soft, pleasing effect. This wall and ceiling will last as long as the house—without a crack.

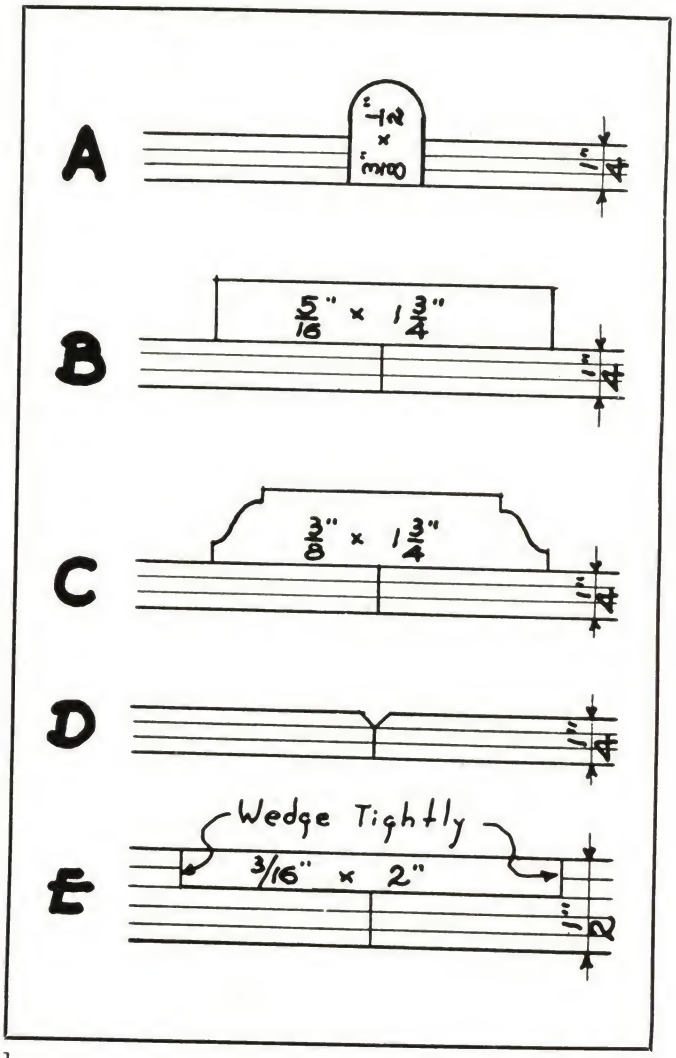
Below:

As Used for Paneled Walls

As shown below, Douglas Fir Plywood lends itself to period treatments. This paneling was treated with a chestnut brown stain, then shellacked and waxed. By this method the color contrasts between winter and summer grain are softened.

Walls and Ceilings

To the original cost of lath and plaster walls must be added the cost of repairing the cracks that will develop sooner or later.



As buildings settle, considerable damage frequently results.

Douglas Fir Plywood makes possible smooth, beautifully paneled, permanently crackproof walls and ceilings at little more than the cost of lath and plaster.

It costs little if any more per surface foot than composition wallboards.

Moreover, as plywood is real lumber, not a composition board, it cannot bulge or sag. Accidental impacts will not fracture it—a characteristic of especial value in steeply sloping ceilings.

A further advantage is that Douglas Fir Plywood walls and ceilings can be finished as soon as they are put up, whereas plaster may not dry for days if the weather is damp. Also, there is no plaster to clean up, and hence no risk of damage to the floors. The plywood panels can be nailed directly to the studding and joists. No space need be allowed between the panels, because Douglas Fir Plywood neither expands nor contracts.

At Right Are Five Typical Treatments of Joints

The usual method is to cover the joints with battens, either with the plain flat type (B) or with battens having moulded edges (C).

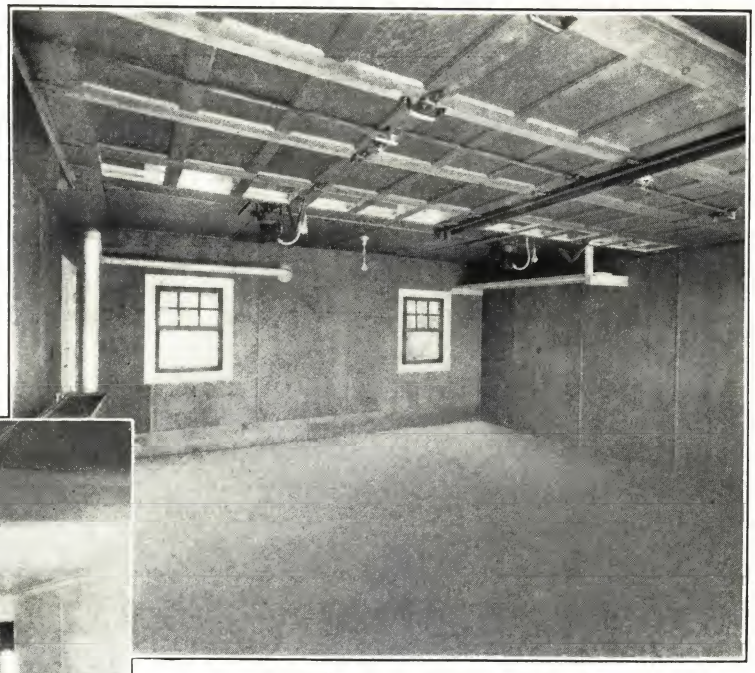
Other methods, however, are also finding favor today. In A is shown the European vogue, in which a small bead is set between successive panels. The V-joint shown in D is used extensively. In this, after fitting the panel but before it is fastened to the wall, the carpenter chamfers the edges slightly with a plane.

When an absolutely flush wall is desired, we recommend Douglas Fir Plywood not less than ½-in. thick. The edges of the panels or sections are rabbeted and a thin strip one or two inches wide is glued into place as shown in E.

Joints and Finishing

Usually some form of batten is used to cover the joints, and this method lends itself to innumerable attractive variations.

However, the fact that plywood will not shrink or swell makes it possible to use a V-joint or a bead-type joint. Depending necessarily on the finish to be applied, joints may be filled with plastic wood or plastic paint, giving an uninterrupted surface. If plastic paint is used in this way, it should be worked into the joint thoroughly. Another method is to cover the joints with a filler strip one or two inches wide set in flush.



Douglas Fir Plywood walls and ceilings can be finished beautifully in any way desired. They can be stained, or stained and waxed, thus softening and enriching the slash-grain in a natural wood finish. Plastic paints can be used to achieve a variety of beautifully modern effects. Or the plywood may be finished with a priming coat, a tinting coat, and a finishing coat of glazing color.

Special Treatments

Douglas Fir Plywood lends itself perfectly to sand-blasted and wire-brushed effects.

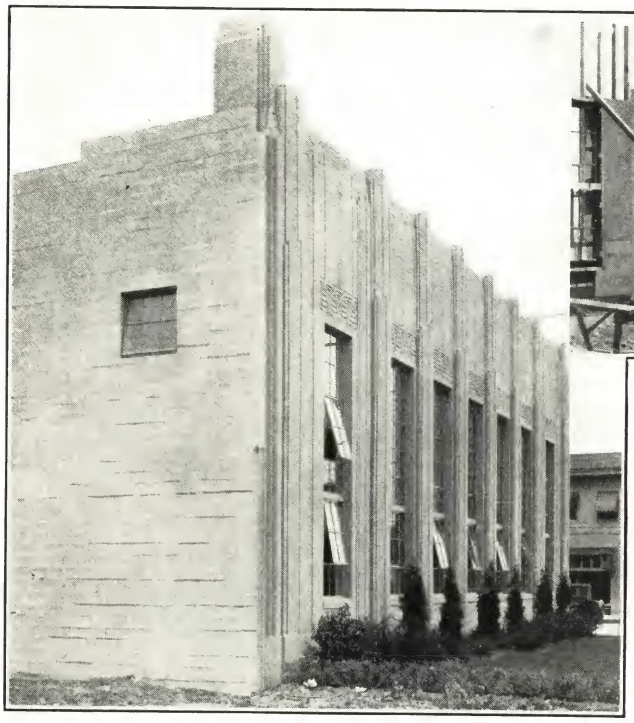
Wainscoting

Douglas Fir Plywood is widely used as wainscoting because of its low surface-foot cost, the labor-saving sizes in which it is available, and the variety of beautiful effects in which it can be finished.

Used As Garage Lining in 2-Car Garage

Douglas Fir Plywood minimizes labor. Also, it furnishes a high degree of insulation—because its thermal conductivity is lower than that of lumber, because the lineal footage of joints is less, and because these joints stay tight. Note that the overhead doors are also of Douglas Fir Plywood.

Office Interior



A typical inexpensive handling of Douglas Fir Plywood for office interiors, including partitions. The big panels can be put up quickly, and can be finished in any way desired.

Below:

Private Office of a Chicago Architect

Note how attractively the sand-blast treatment differentiates the winter and summer grain. This particular decorative handling again suggests the almost limitless possibilities of Douglas Fir Plywood for interiors. The narrow, moulded battens here illustrated, although a relatively new development in paneled walls, are achieving a considerable vogue.

Erection of Douglas Fir Plywood Forms for the Hill Military Academy, Portland, Oregon

Note the simplicity of the large-unit construction. After the pouring and setting, these panels may be dismantled quickly and reused—the rugged plywood construction minimizing damage in the dismantling process. The same plywood can be used again and again.

Bank Building, Portland, Oregon

Note the difference between the sidewall of this bank building—for which shiplap forms were used—and the smooth front wall obtained by the use of Douglas Fir Plywood. No smoothing or plastering was necessary on the latter.

Concrete Forms

The rapidly increasing use of exposed concrete as an architectural medium requires stronger and more accurate form construction, and therefore has widened appreciation of the advantages of Douglas Fir Plywood as a form material.

Douglas Fir Plywood is available in large, satin-smooth panels for use either as form lining or—in the thicker panels from ½ to ¾ inch—*as form lumber and lining combined.*

If properly handled, the plywood can be used from four to eight times, as its great strength minimizes damage when forms are dismantled. In fact, in some instances Douglas Fir Plywood forms actually have been reused as many as fifteen times. When no longer usable in forms, this material can serve as wall and sub-floor sheathing in frame buildings.

Smooth Non-bulging, Non-leaking—By making rubbing unnecessary, Douglas Fir Plywood forms save from 3c to 4½c per square foot of surface. If a stucco surface is required, the saving is even greater because the smooth surface given by the plywood requires only a very thin coat of stucco. If the surface is to be painted, much less paint will be required—and much less labor. The great saving thus made possible is not as yet widely realized by contractors and builders.

Leakage of moisture and formation of "fins" are minimized, because Douglas Fir Plywood will not shrink or expand, thus assuring tight joints, and because the large panels greatly reduce the lineal footage of joints.

Thin panels of Douglas Fir Plywood—¼ and $\frac{3}{16}$-inch—can easily be bent for use in curved forms. For example, the ¼-inch can be bent to a radius as small as 18 inches.

If the ¼-inch Douglas Fir Plywood is used simply as a liner, it is unnecessary to build up forms solidly with lumber. Spacing between boards can be from 2 to 4 inches.

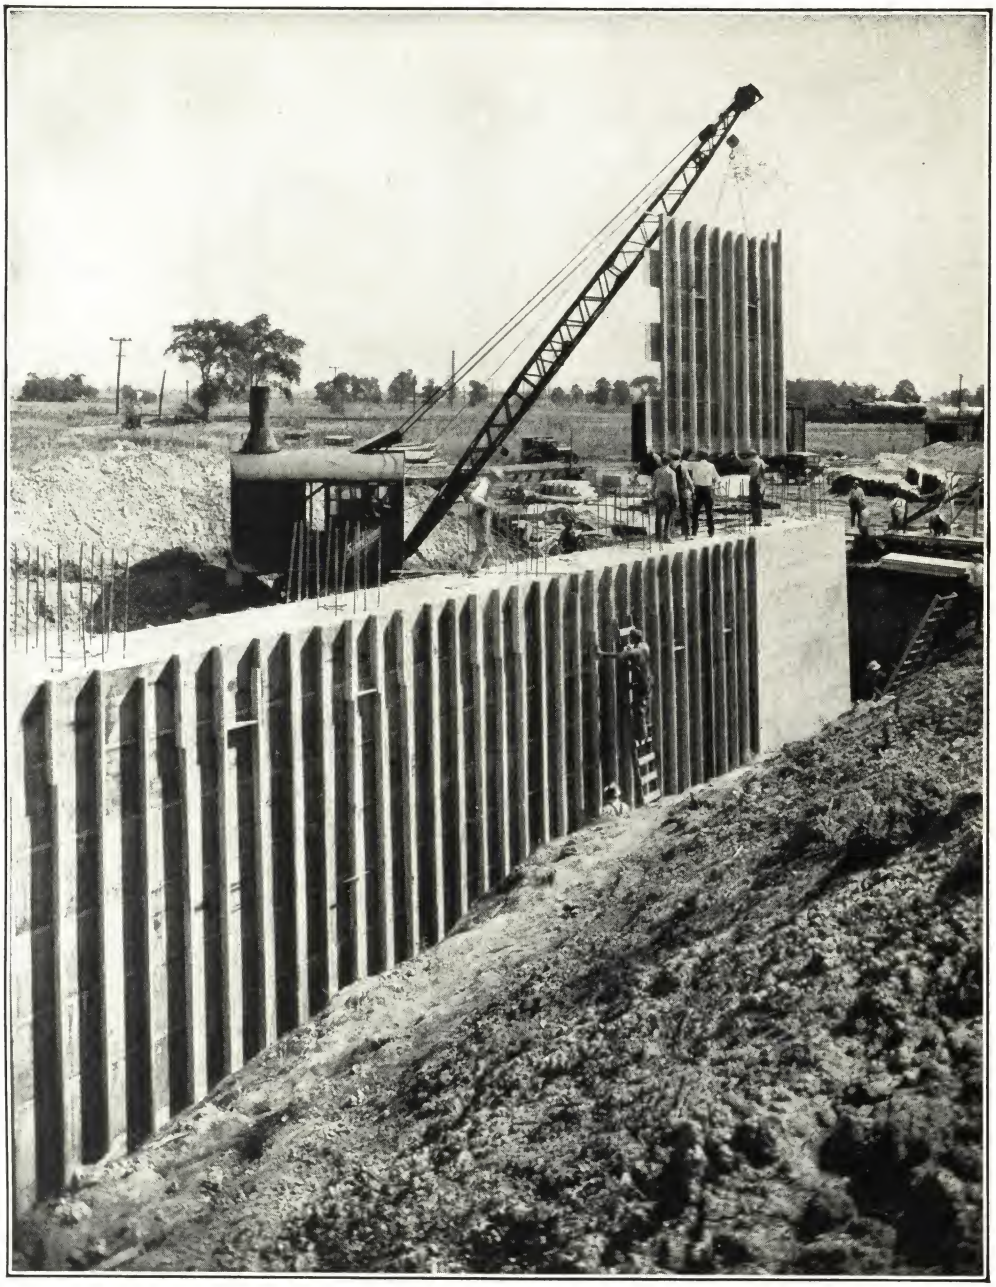
Ideal for Reverse-Moulds—The reverse-moulds required by the vogue of ornamentation in monolithic construction can be nailed or screwed on the large Douglas Fir Plywood panels at a substantial saving in labor. Both nails and screws can be driven close to the edge without splitting the plywood.

A further economy offered by Douglas Fir Plywood is that 1,000 square feet will cover 1,000 square feet of surface, whereas the same surface would require approximately 1200 feet of shiplap.

In using Douglas Fir Plywood, do not space studs farther apart than you would with ordinary lumber, if pouring is faster than 18 inches an hour.

Douglas Fir Plywood Forms can be built at a 10 to 50 per cent saving over ordinary lumber-and-lining forms. Moreover, the plywood adapts itself perfectly to circle and pilaster work at no increase in cost.

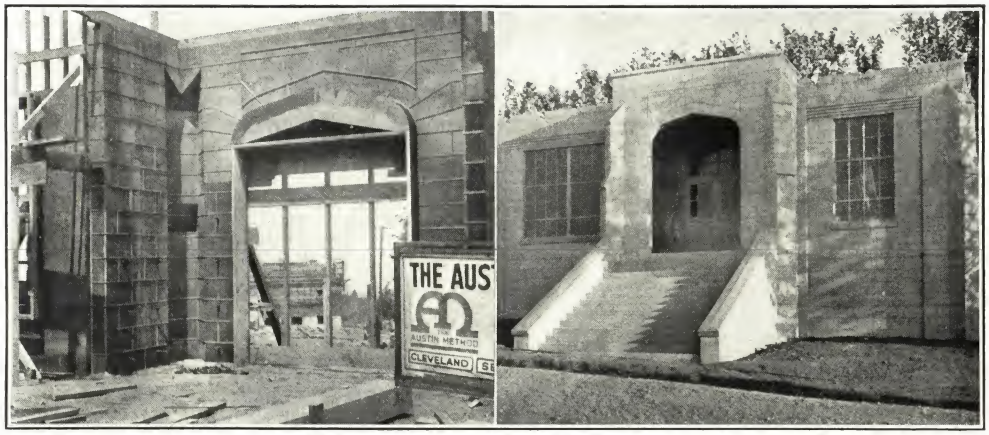
Treatment of Forms—To prevent surface scaling when the forms are removed, the plywood should be treated with a form oil. Cup grease cut with kerosene and linseed oil is sometimes used. If the plywood is to be reused a number of times, varnish both sides with a cheap gloss oil varnish. For each reuse, another coating of form oil should be applied. Generally speaking, mineral oils will be found more effective than vegetable oils.



Cleveland Stadium Under Construction

Approximately 300,000 square feet of ¼-inch Douglas Fir Plywood was used for the concrete form liners of this magnificent new stadium in Cleveland, Ohio.

Care should be taken to remove thoroughly the small particles of concrete that have adhered to the forms. After the second or third use, forms will be found smooth and clean with practically no adhesion of concrete.



Tables on page 12 show the strength and nail-and-screw-holding properties of Douglas Fir Plywood in various thicknesses, thus enabling contractors to determine the right thickness for a particular job.

Finally, it is important to remember that the best possible form lining will not give satisfactory results if the size and placing of cleats, ties, studding and other bracing are inadequate.

Combines Strength with Light Weight

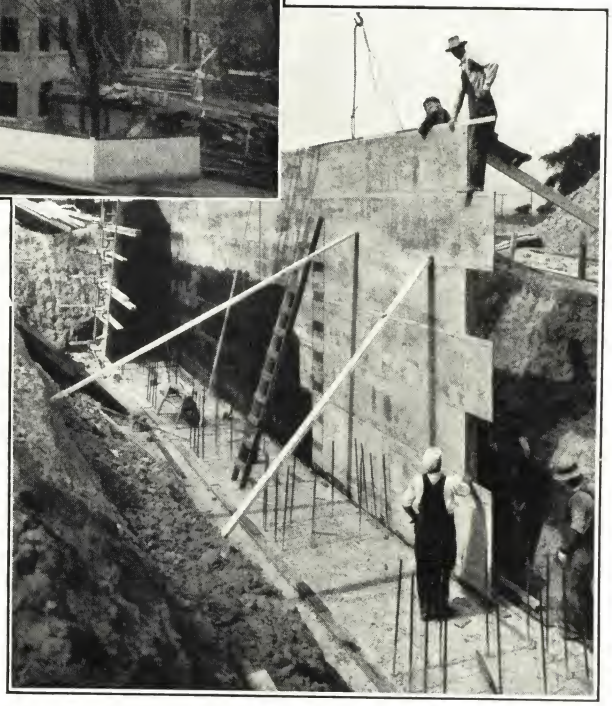
Whole sections of forms can be hoisted into place. If a number of identical foundations or walls are to be built, the same form can be used again and again.

Forms in Place — Reverse-moulds Removed

An Ornamental Entrance

A perfect backing for reverse-moulds. Because it holds nails and screws without splitting, Douglas Fir Plywood can be used for all kinds of pattern and reverse-mould work. Note the perfect, smooth surface. No rubbing was necessary.

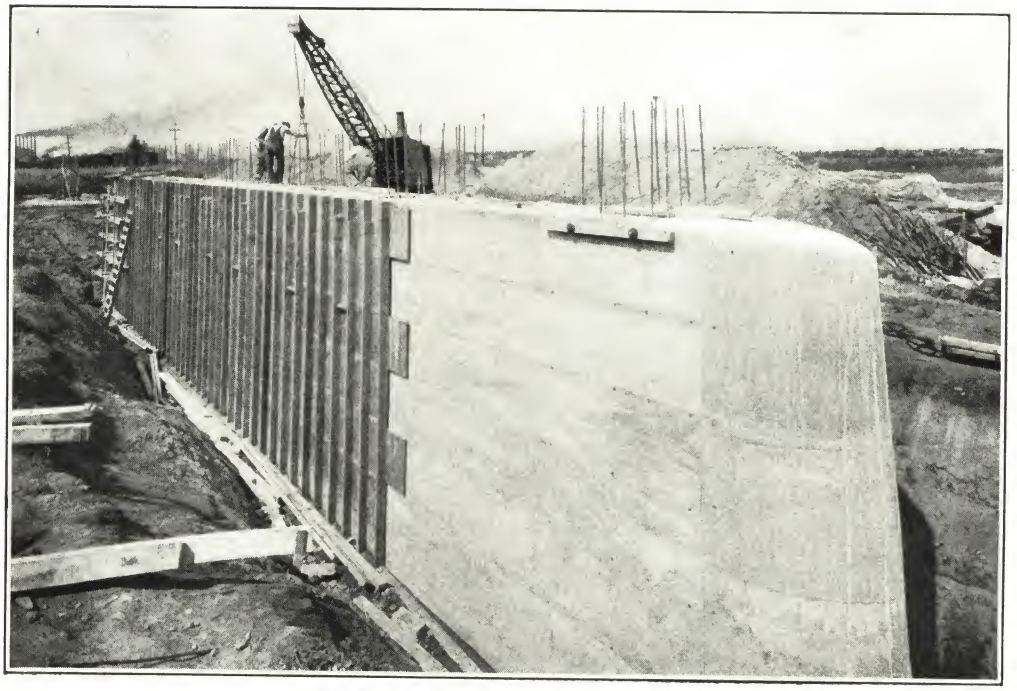
Christian Science Building, Minneapolis



Douglas Fir Plywood concrete forms help speed construction because there are fewer pieces to handle, with less nailing, and the larger sizes are form lumber and lining *combined.*

Closets, Cupboards and Cabinets

For closets, cupboards and cabinets—in fact for every kind of built-in—Douglas Fir Plywood is preferred because its large sizes save labor and because it will not split and, once in place, will not warp. Thus drawers cannot stick and are dustproof. Doors can be of the flush type. Nails and screws can be placed close to the edge without danger of splitting the wood.



Partitions

In partitions Douglas Fir Plywood offers advantages of lightness, toughness, and resistance to tensile stresses as well as to shrinkage and expansion. It is hard to damage by blows. Unlike the studded partition of composition board or plaster, the strength of which depends primarily on the framework, a Douglas Fir Plywood partition is a homogeneous structure of substantial strength. Moreover, if there is studding it can be thinner and more widely spaced.

Construction of a Viaduct

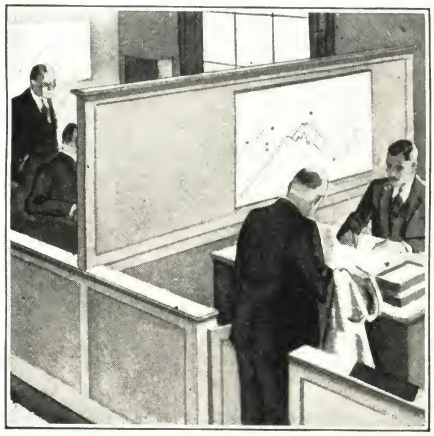
Forms made of these big single-piece Douglas Fir Plywood panels, require a great deal less time and labor. They are light, and easy to place and transport.

Completed Section of Viaduct

Note the smoothness of the concrete when Douglas Fir Plywood is used for form lumber. The surfaces need not be plastered or painted. If painted, they require much less paint and labor than concrete surfaces resulting from ordinary forms.

For Built-in Equipment

The neatness of Douglas Fir Plywood—as well as size and freedom from splitting—makes it particularly useful for all kinds of built-ins and kitchen conveniences.



For Restaurant Booths

Douglas Fir Plywood is steadily increasing in popularity for jobs like these—because of strength, ready workability, and low cost.

Screens

An excellent use for Douglas Fir Plywood—easy to make to any design, light in weight, rigid and unbreakable, and suited to any finish.

For Partitions

Douglas Fir Plywood has no equal for office and residential partitions—real wood panels, quick and easy to put in place, strong, neat looking, and readily finished.

The Breakfast Nook

Douglas Fir Plywood is particularly suitable for built-ins like these—because of its strength, ready workability, and low cost.

Display Racks

Wherever large surface area, light weight, and stiffness are wanted, Douglas Fir Plywood can be used with greater economy than any other material.

Shelving and Bookcases

Nothing equals plywood for compactness, strength, and ease of assembly. The economy of Douglas Fir makes it an ideal plywood for shelving, bookcases and similar articles.

For Dustproof Coal Bins

Douglas Fir Plywood bins keep coal dust out of upstairs. The joints stay tight, and even in a damp basement the panels will not warp.

For Warpproof Drawers and Bins

The neatness of Douglas Fir Plywood, its convenient size, and warp-resisting qualities, make it indispensable for this class of work.

Shelving and Bookcases

Warpproof, splitproof shelving and bookcases can be made from Douglas Fir Plywood for even less per surface foot than the cost if built of ordinary lumber. Moreover, Plywood shelving can be much thinner than ordinary shelving, without sacrifice of strength.

Warpproof Doors, Drawers and Bins

Whenever permanently tight joints are necessary, no material is as satisfactory and economical as Douglas Fir Plywood. It will not shrink or swell and, once in place, is forever proof against warping. Dust cannot invade Douglas Fir Plywood drawers and bins, and even the thinnest panels cannot crack. This material makes the construction of attractive flush doors for cabinets a simple carpentry job.

Restaurant Booths

Decorative yet sturdy and inexpensive restaurant booths, and similar construction, can be built quickly with Douglas Fir Plywood. Its big-unit sizes save labor, and even the thinnest panels will not split. Neither will they warp in place, and they can be finished attractively in any way the decorative scheme of the interior calls for. Portable screens, strong and remarkably light in weight, can be built of Douglas Fir Plywood.

Dustless Coal Bins

Because Douglas Fir Plywood panels fit tightly and never shrink or swell, dustproof coal bins can be built at low cost. Quick construction is made possible by the large size and light weight of the panels. And tumbling lumps of coal cannot split them. Moreover, as Douglas Fir Plywood, once in place, will not warp, basement dampness cannot affect a coal bin—or anything else—made of this material.

Breakfast Nooks and Window Seats

Douglas Fir Plywood makes possible inexpensive built-ins that will not warp, that will not split under heavy impacts, and that will take the modern finishes beautifully. Such built-ins are inexpensive, not only because Douglas Fir Plywood comes in big sizes that make piecing and glue-up work unnecessary, but also because it costs less per surface foot than even ordinary lumber.

TEST DATA ON DOUGLAS FIR PLYWOOD

The following data are the result of the first tests in a comprehensive series now in progress. This series will include not only tests of the physical characteristics of Douglas Fir Plywood, but also tests as to its performance in specific uses.

Because the test results below would be incomplete without some basis of comparison, five materials typical of those sometimes used instead of Douglas Fir Plywood were subjected to exactly the same tests—under exactly similar conditions.

In fairness, letters instead of trade names have been used to designate these five materials below. A and B are fiber insulating boards; C is a plaster board; D is a hard-compressed fiber board; and E is one of the old-style fiber wallboards.

A number of samples of each of these materials—and of Douglas Fir Plywood—were submitted to each of the following tests, to establish an average strength value that would be eminently fair.

All these tests were made by the Northwest Testing Laboratory, which in the Northwest represents the nationally known Pittsburgh Testing Laboratory.

A complete log of any of these tests will be sent upon request.

COMPRESSION TESTS ON DOUGLAS FIR PLYWOOD

Material	Dimension of Test Specimen			Area, sq. in.	Maximum load, lbs.	Load, lbs. sq. in.
	Thickness, in.	Width, in.	Length, in.			
Load Applied with the Grain of Outside Plies						
5-ply	3/4	6	6	4.50	18538	4186
5-ply	5/8	6	6	3.75	10644	2893
5-ply	1/2	6	6	3.00	10492	3497
3-ply	3/8	6	6	2.25	6630	2860
3-ply	1/4	6	6	1.50	4198	2855
3-ply	3/16	6	6	1.125	2014	1917
Load Applied Across Grain of Outside Plies						
5-ply	3/4	6	6	4.50	15262	3436
5-ply	5/8	6	6	3.75	9096	2472
5-ply	1/2	6	6	3.00	6462	2162
3-ply	3/8	6	6	2.25	5206	2180
3-ply	1/4	6	6	1.50	908	609
3-ply	3/16	6	6	1.125	380	360
Compression Tests on Other Materials						
A	.500	6	6	3.0	690	230
B	.4375	6	6	2.625	448	170
C	.25	6	6	1.50	826	550
D	.1875	6	6	1.125	846	751
E	.1875	6	6	1.125	390	346

Key: Materials A and B are fiber insulating boards. C is a plaster board. D is a hard-compressed fiber board. E is an old-style fiber wallboard.

Compression Tests

Two series of tests were made on the Douglas Fir Plywood. In the first series the load was applied *with* the grain of the outside plies. In the second series the load was applied *across* the grain of the outside plies. Only one series of tests was necessary on the other materials, because their grain or fiber did not run in different directions.

All compression test pieces were cut exactly 6x6 inches and bearing was obtained by placing the pieces in the testing machine and applying the load on the opposite edge.

Tensile Tests

Test specimens in this test were cut 3 inches wide and 18 inches long, and the distance allowed between the jaws of the testing machine was 8 inches.

As in the compression test, two series of tests were made on the Douglas Fir Plywood, on one the load being applied *with* the grain of the outside plies, and on the other, *across* the grain of the outside plies.

TENSILE TEST ON DOUGLAS FIR PLYWOOD

Material	Dimension of Test Specimen			Area, sq. in.	Maximum load, lbs.	Load, lbs. sq. in.
	Thickness, in.	Width, in.	Length, in.			
Load Applied with the Grain of Outside Plies

5-ply	1/2	6	18	702	.53	8424
3-ply	3/8	6	18	434	.51	9300
3-ply	1/4	6	18	220	.76	10560
3-ply	3/16	6	18	214	1.10	18300
Transverse Tests on Other Materials						
A	1/2	6	18	27	.66	324
B	7/16	6	18	15	..	236
C	1/4	6	18	42	.61	2016
D	3/16	6	18	51	.92	4346
E	3/16	6	18	31	.95	2642

Key: Materials A and B are fiber insulating boards. C is a plaster board. D is a hard-compressed fiber board. E is an old-style fiber wallboard.

Transverse Tests

Here again two series of tests were made on the Douglas Fir Plywood, one in which the load was applied *with* the grain of the outside plies and another with the load applied *across* the grain of the outside plies.

All test pieces were 6 inches wide and 18 inches long. They were placed on supports 12 inches on centers, and the load was applied at midspan.

WATER ABSORPTION TEST
(Figures show percent absorption at different periods)

Thickness, in.	4 Hours	8 Hours	24 Hours	48 Hours
Douglas Fir Plywood				
¾	10.3	12.9	18.2	27.3
⅝	9.7	13.6	19.7	29.6
½	9.0	12.6	18.4	27.5
⅜	9.2	13.6	17.9	27.5
¼	16.9	24.9	29.7	47.4
Material A	23.5	43.3	49.9	67.8
Material B	22.5	32.8	44.8	51.5
Material C	52.3	62.9	66.6	71.2
Material D	7.1	11.5	16.0	23.3
Material E	83.0	98.0	115.9	128.5

Key: Materials A and B are fiber insulating boards. C is a plaster board. D is a hard-compressed fiber board. E is an old-style fiber wallboard.

Water Absorption Test

All test pieces were cut 6x6 inches. The edges of all pieces were sealed with paraffin, after which they were submerged in water to a depth of 1½ inches.

Weight readings were taken at four, eight, twenty-four and forty-eight hours. The percent of water absorption at the different periods is given in the following table.

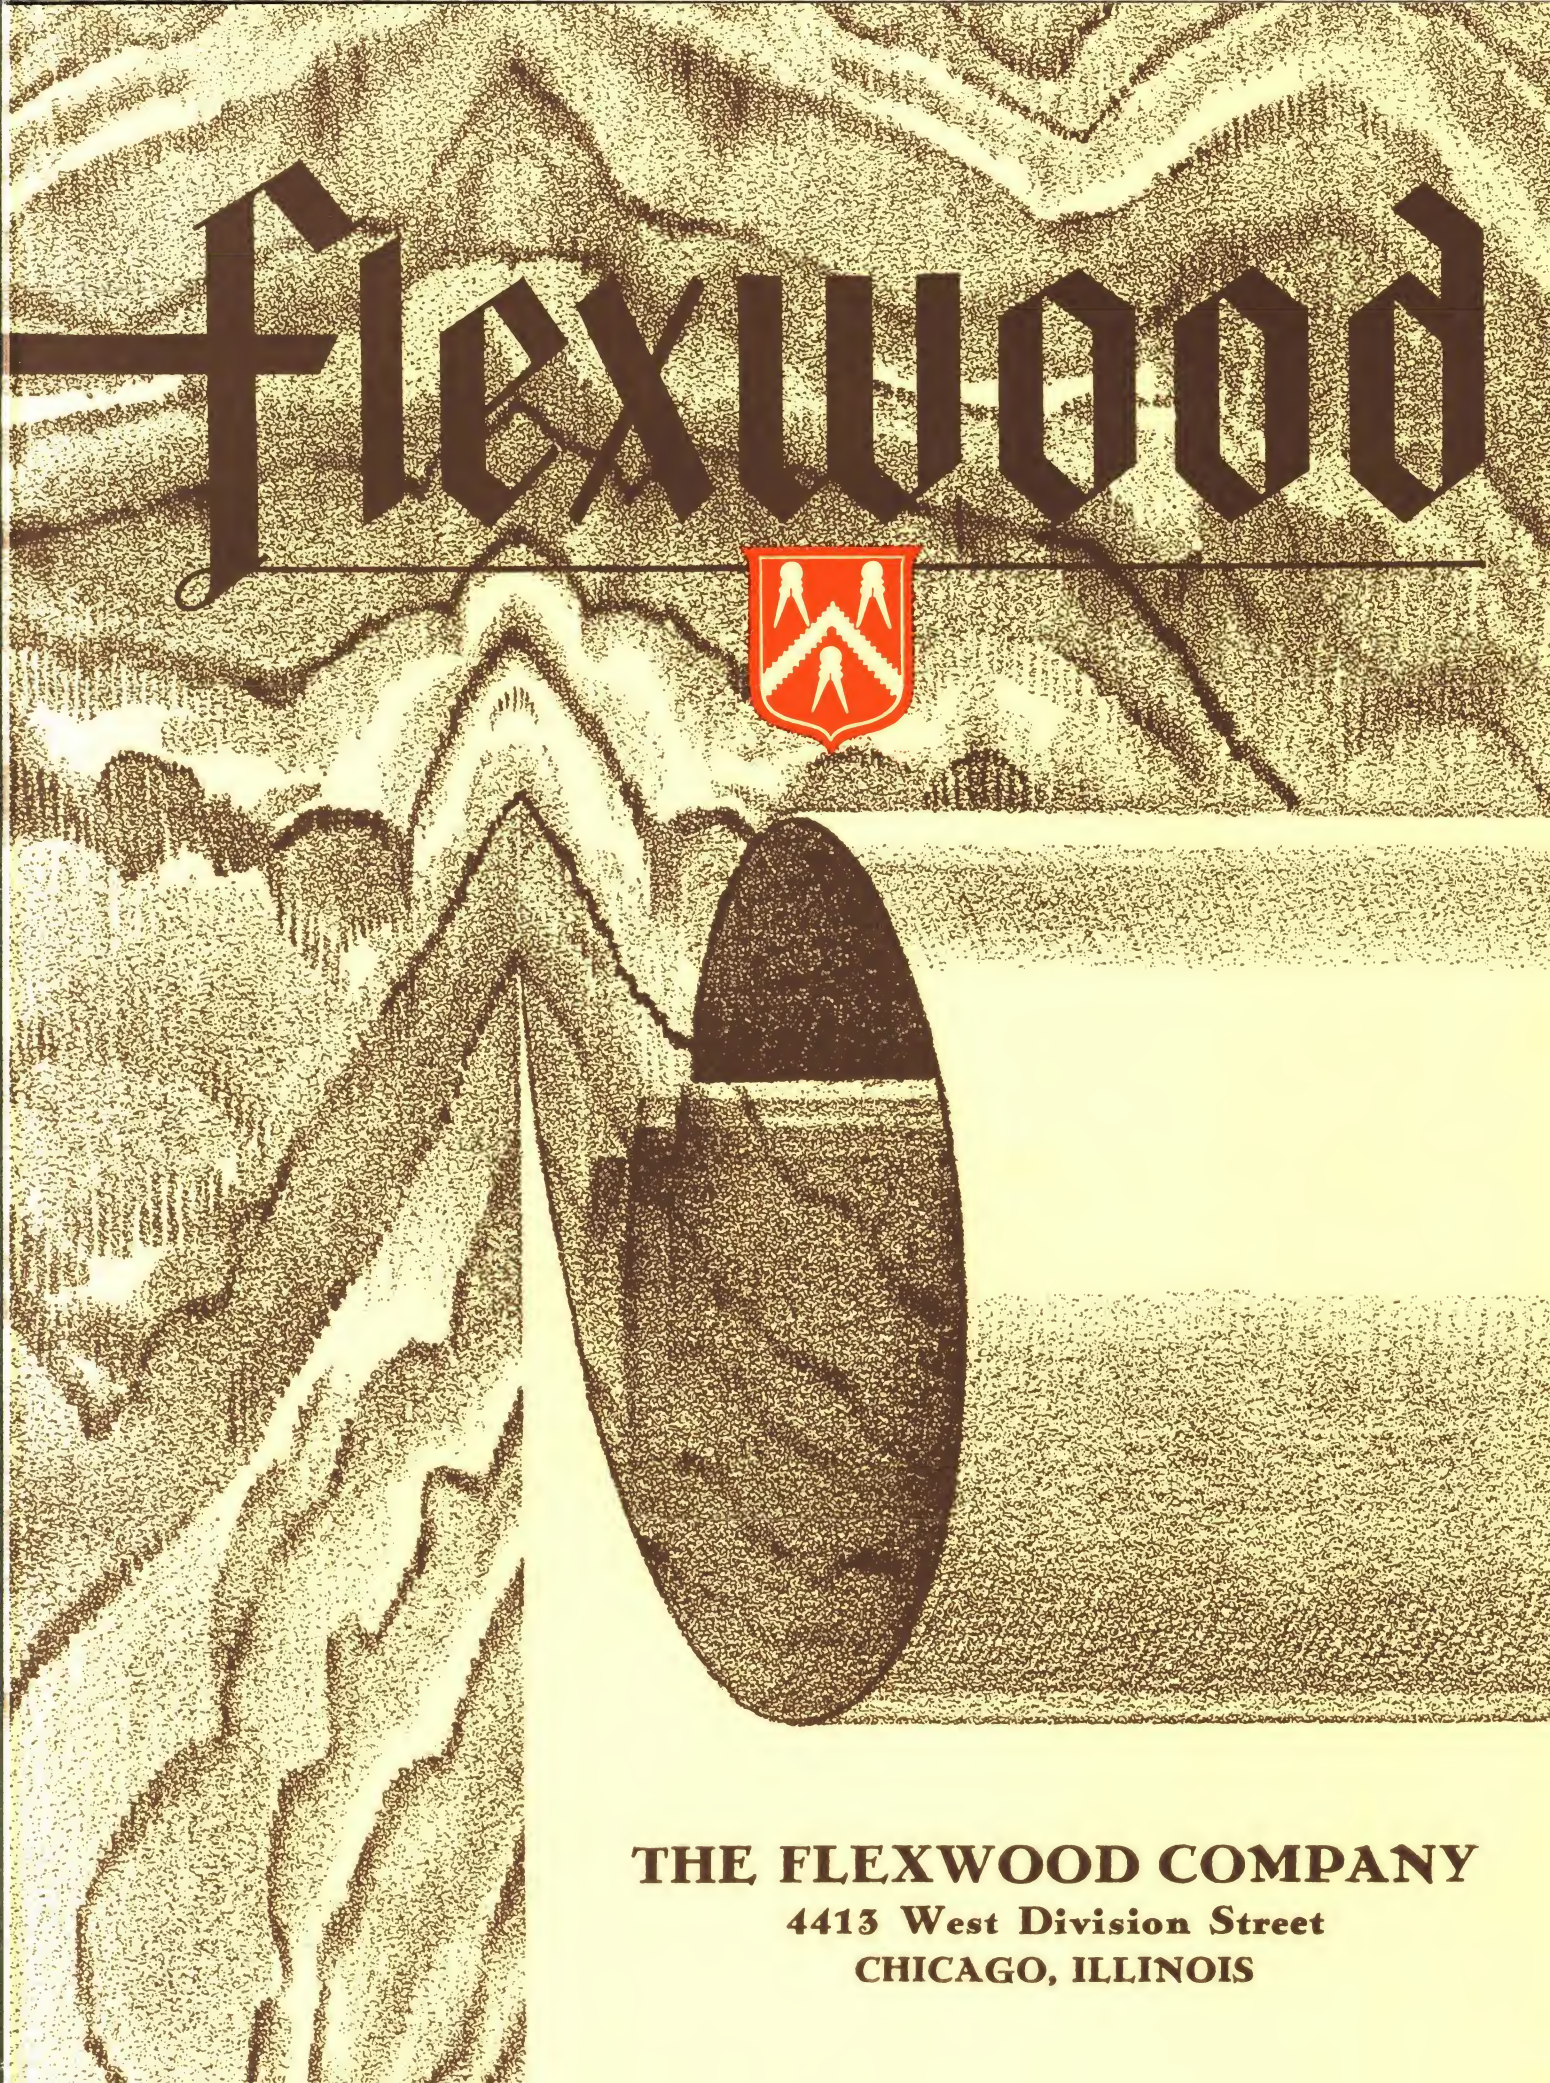
Test to Determine the Nail-Holding Power of Douglas Fir Plywood and Other Materials

In this test all test specimens were cut 10x10 inches. The specimens were nailed on two pieces of sawn and planed Douglas Fir 1¾x1¾x13½ inches. The nails were spaced 3 inches on centers and driven through the test specimens into the supporting member. Supports were spaced 7½ inches on centers. The nailed-up sections were placed in the testing machine in such a manner as to exert a direct pull on the nails.

Douglas Fir Plywood specimens were given a most severe test in the use of cement-coated box nails. In spite of this severe test, eighty-five of the ninety nails used were pulled out of the supporting members.

In the other test specimens, every one of the nails remained in the supporting member, the heads of all nails pulling through test specimens. Douglas Fir Plywood, because of its laminated construction, will hold nails exceedingly well even though the nails are driven very close to the edges of the plywood.

Test to Determine the Nail-holding Power of Douglas Fir Plywood



Test No.	Size of test specimen, in.	Number of nails in specimen	Type of nails	Spacing of nails, in.	Maximum load, lbs.	Load per nail, lbs.
1	5-ply 10x10x¾	6	8d box	3	1670	278

THE FLEXWOOD COMPANY

4413 West Division Street, CHICAGO, ILL.

BRANCH OFFICE, Chrysler Building, NEW YORK

Trade-Mark Flexwood Reg. U.S. Pat. Off.

Description—Physical Properties

Flexwood is genuine selected cabinet wood, cut thin and so mounted on fabric that it acts as a unit—the two are inseparable. The wood, through a special patented process, is rendered extremely flexible so that it can easily be bent around corners without cracking—the grain of the wood being parallel to the edge about which it is bent.

The same process that renders the wood flexible removes its power to warp or check. It may be applied to any smooth, flat wall surface.

Application

Flexwood is as pliable as canvas and is applied to the wall surface with a special Flexwood paste. It is applied by any competent paperhanger who will follow Flexwood specifications.

General Characteristics—Appearance

Walls finished in Flexwood obviously have all the characteristics and appearance of wood. The material offers the opportunity to use genuine wood for interior decoration without the limitations of size, structural difficulties or excessive costs associated with conventional cabinet wood paneling.

Used in conjunction with wood accessory mouldings of base, wainscot caps, panel mouldings, cornices, etc., practically any architectural period effect may be obtained. The material lends itself with unusual success to modern design treatment.

Flexwood has been used by many nationally known architects in outstanding installations throughout the country. Its architectural appeal and acceptance as a material of marked practicability and exceptional design qualities have been most gratifying.

Woods and Sizes

Flexwood is supplied from stock in lengths 8, 9 and 10 feet, in the following standard cabinet woods:

American Walnut (Matched or Unmatched)—
Half round (bold matched pattern) widths 8 to 15 in.
Sliced (more vertical pattern) widths 6 to 14 in.
Rotary (occasionally used where sheets 18 to 30 in. wide are required).

Mahogany (Matched or Unmatched)—
Ribbon (quartered vertical stripes) widths 8 to 14 in.
Flat cut (bold matched pattern) widths 10 to 18 in.

White Oak (Matched or Random)—
Quartered (shows flake figure) widths 6 to 10 in.
Plain (flake very faint or lacking) widths 8 to 13 in.

Prima Vera (Matched or Unmatched)—
Flat cut (figure from plain to ribbon) widths 8 to 15 in.

Lacewood (Matched)—
Quartered (flake figure) widths 8 to 13 in.

Knotty Pine (Random Boards)—
Stock limited widths 5 to 12 in.

Note: Never specify a minimum width of matched stock as a run of sheets all one width cannot be supplied.

Other Woods—While Flexwood stocks are not always complete in the following woods, they may frequently be obtained: Birch, Maple, Oriental Wood, Aspen, Maca wood, Ayua and other woods. Always consult THE FLEXWOOD COMPANY before specifying other than standard woods.

Sheets of Walnut and Mahogany Flexwood Showing Typical Stock and Finished Samples on Metal and Wall Boards

Finishing

The finishing should be done by a competent wood-finisher.

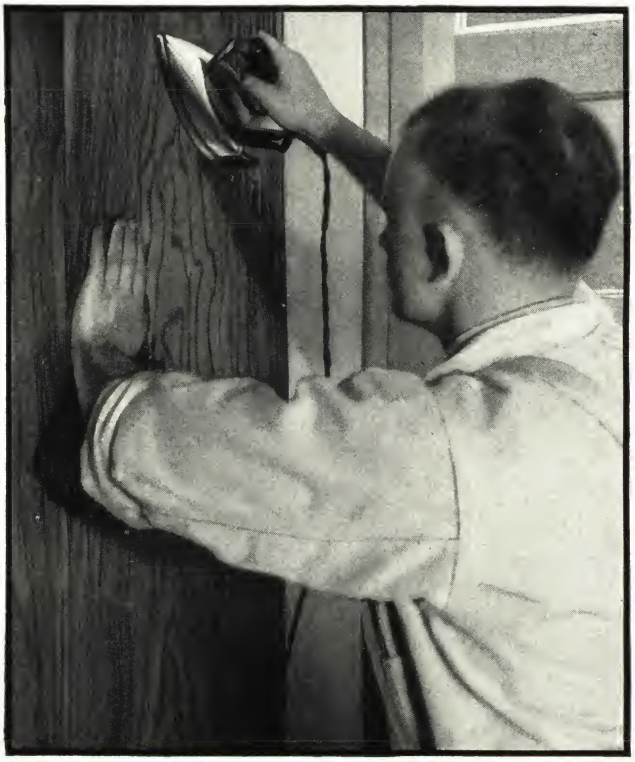
The natural beauty of the wood is best revealed by transparent varnishes and lacquers, which preserve, without hiding, the pattern of the grain.

A dull or flat finish is preferred, though any finish used on wood may be used on Flexwood.

Samples

Since Flexwood is a natural product dependent upon the particular log or cutting obtainable, there are the same variations as would apply to cabinet wood veneers. Samples show only general appearance and color.

METHOD OF APPLYING FLEXWOOD



Application of Wall Liner
to Plaster Walls
Cloth is hung dry

Application of Paste to Back
of Flexwood Sheets
Sufficient paste on edges very important

In Hanging Flexwood,
Edges Are Butted Together Lightly
and the Joint Made the Full Length of the Sheet

Using a Hot Pressing Iron
Heat softens paste spots that become too dry before
application, thus making firm bond

FLEXWOOD—MASTER SPECIFICATIONS

Include as a Separate Division of the Painting and Decorating Specifications

Note: Notes in italics are explanatory or advisory only and should not be included in the specifications.

Note: This form is a Master Specification and includes clauses covering all conditions ordinarily encountered. Select and include only those clauses which apply to the particular work.

(1) Work Included

The work required under this specification includes all labor, materials, equipment and services necessary for and reasonably incidental to the providing of all Flexwood on the following areas:

Note: Here list and locate all rooms to be furnished with Flexwood, designating the particular wood used or refer to the detail drawing containing the information by sheet and number.

Note: If solid wood cornices, picture moulds, chair-rails, wainscot caps, baseboards, panel mouldings, applied over Flexwood are to be furnished and erected by this contractor, list and locate here. If furnished and erected by the Carpentry Contractor, so mention here and specify under the Carpentry Division.

(2) Shop Drawings

Drawings not furnished by the architect shall be furnished in triplicate by this contractor, if required.

(3) Samples

Ordinarily samples of Flexwood are not required in the standard woods. Finished samples shall be prepared from the actual flitch to be used. These samples to be approved by the Architect.

(4) Storage and Protection

All Flexwood, upon receipt at the building, shall be stored in the original package (preferably under lock and key) in a dry room maintained at a uniform temperature until applied. Adequately protect the edges and surfaces of Flexwood at all times.

(5) Workmanship

All labor shall be performed in the best manner by skilled workmen.

(6) Preparation of Walls

(6a) General—

(6a1) The surfaces to receive Flexwood shall be thoroughly dry and smooth.

Note: Moisture will impair permanent adhesion. Irregularities and imperfections in the surface will obviously appear through the Flexwood applied to it.

(6a2) Lead and oil paint in good condition need not be removed. If paint is glossy, rub down with steel wool. Flat paint must be removed.

(6b) Plaster Walls—

(6b1) Remove all grit from walls with sandpaper and point up defects with Swedish Putty or plaster of paris mixed with glue size.

(6b2) Completely remove all hard or gloss oil on old or calcimined walls by brushing Flexwood paste on wall and allowing this to dry, thereby peeling the size off wall.

(6b3) Prime the complete surface of the wall with Flexwood Primer. Allow the primer to dry at least 24 hours.

(6c) Wall Board Walls—

(6c1) Gypsum Wall Boards—All joints and nail holes shall be rendered smooth and permanently tight by pointing up with Swedish Putty or water putty.

Prime all surfaces with Flexwood Primer. Allow the primer to dry at least 24 hours.

(6c2) Wood, Plywood and Presdwood—Remove the glossy surface of hard fiber board with sandpaper. Render all nail holes and joints smooth and tight by pointing up with Swedish or water putty. Prime all surfaces with Flexwood Primer. Allow Primer to dry at least 24 hours.

Wood surfaces that have been painted with lead and oil are satisfactory as a base for Flexwood, but flat paint, shellac, lacquer and varnish must be removed.

Note: All joints on wood surfaces must be battened with wood battens to avoid joints in the finished work due to expansion and contraction of wood.

(6d) Metal Walls—Clean the metal surface to remove all traces of oil, by the use of Oakite or Wyandotte. Use a solution of six ounces to a gallon of hot water, washing the metal with the solution as recommended by the manufacturers, and subsequently rinsing with clean water. Apply Flexwood Primer to the metal in a uniform coat well brushed out and allow this to dry at least 24 hours.

(6e) Marble, Concrete, Glass, Cement Asbestos Board, Glazed Tile Walls, Etc.—

Note: For specifications covering application to these and other surfaces, write to THE FLEXWOOD COMPANY, *4413 West Division Street, Chicago, Illinois.*

(7) Materials

(7a) Flexwood—Flexwood, listed and located in paragraph (1), shall be as manufactured by THE FLEXWOOD COMPANY, 4413 West Division Street, Chicago, Illinois.

(7b) Paste—Paste shall be special paste as furnished by THE FLEXWOOD COMPANY, mixed in accordance with the manufacturer's directions printed on the container.

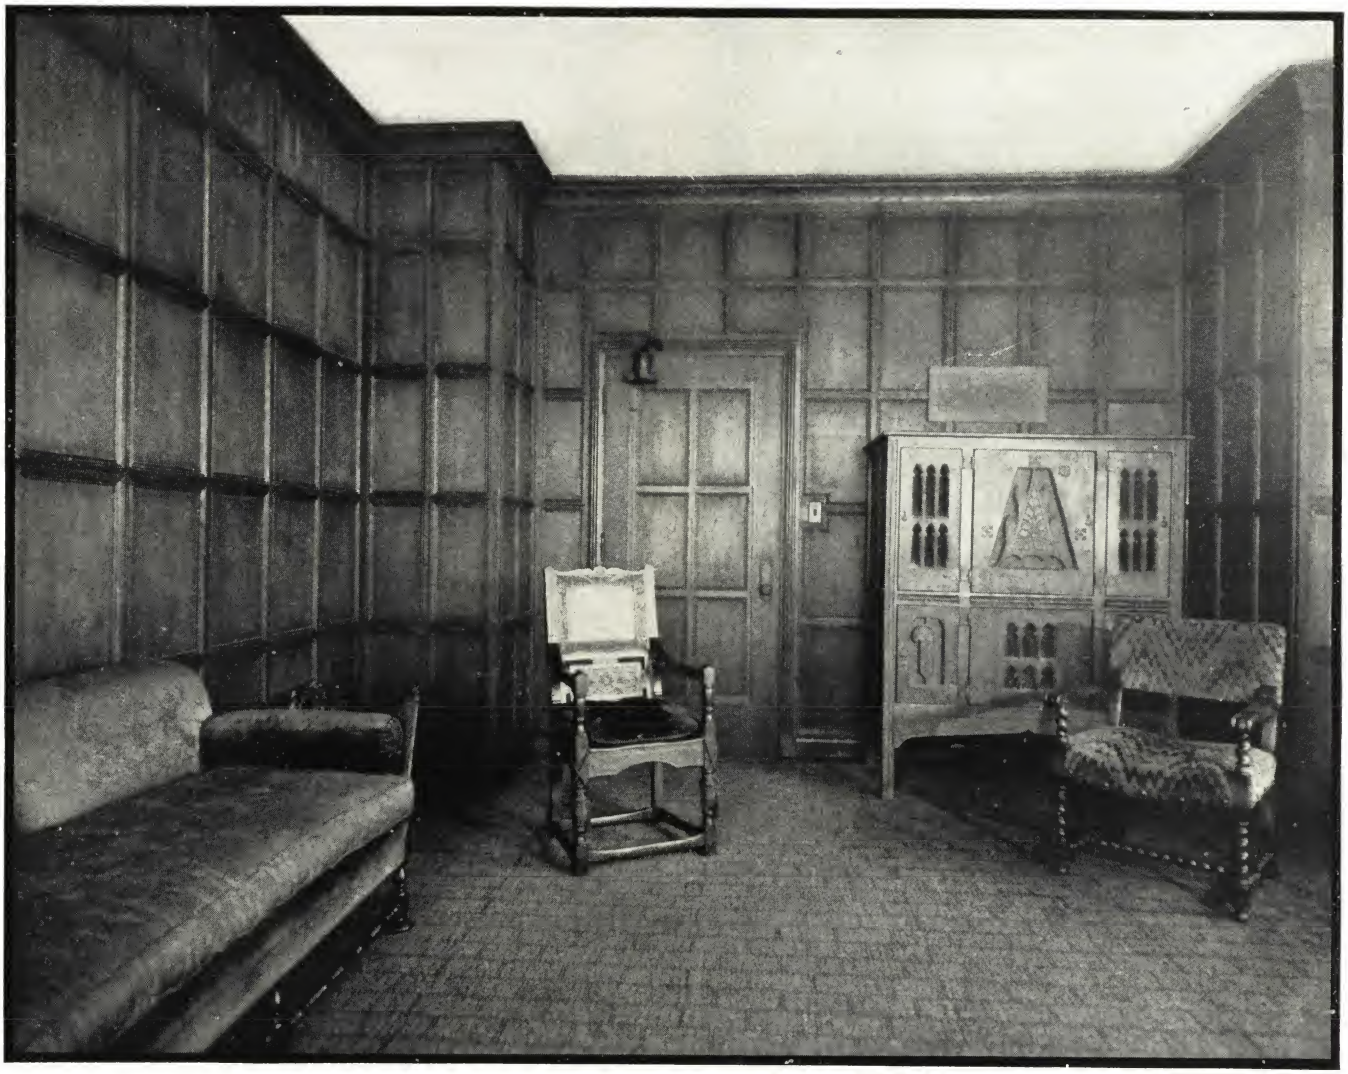
(7c) Wall Liner—Wall liner shall be the Flexwood Wall Liner as furnished by THE FLEXWOOD COMPANY.

(7d) Primer—Flexwood Primer shall be the Flexwood Primer as furnished by THE FLEXWOOD COMPANY.

Note: Flexwood Primer eliminates painting or other sizing. The primer largely overcomes alkalinity in plaster and eliminates "hotspots" and suction in plaster walls.

(8) Wall Lining

Line the wall with Flexwood Liner. Apply the Flexwood Paste, as specified on the paste container, to the wall and hang the liner dry vertically, lapping the joints ¾ in. to 1 in. Roll the lapped joints flat with the aid of a 2-in. seam roller, kept wet.



Note: Wall Lining is not required over wood, plywood, Presdwood or metal walls.

stiles and rails. Plain Oak

(9) Hanging the Flexwood

Note: *All wall surfaces, including those covered with Flexwood Liner, must be dry before application of Flexwood.*

(9a) Trimming—Knife trimming shall only be done on a table before the Flexwood is hung.

Note: *Trimming on the wall should be minimized to the greatest extent, since it is a serious matter to cut into the wall lining.*
The edges of Flexwood are factory trimmed straight and parallel.

If the edges of the Flexwood lap after hanging, and must be trimmed, insert a zinc strip under the seam to trim on.

(9b) Pasting—Mix paste, as specified on container, and apply uniformly to the back of the Flexwood with a 4½ in. short bristle paint brush. Make sure there are no dry spots.

Use special care to insure a full continuous coat of paste at the edges. Allow the paste to set until tacky.

(9c) Wall Sizing—After pasting back of Flexwood, apply thin coat of paste to wall, allowing same to become tacky before hanging Flexwood.

Note: *The tackiness of the paste may be tested by touching the surface with the palm of the hand. If the sheet is raised off the table, the desired degree of tackiness has been reached.*

(9d) Hanging—Hang the Flexwood by starting from a true, plumb line at the center of each wall. Place the sheets in the designated numerical order, matching the figure of the wood of adjacent sheets at the abutting edges.

Note: *Each sheet of matched stock is numbered at the factory so that the figure of the wood in adjacent sheets will match when applied in the correct sequence.*

Butt edges together lightly and first secure the top edge at joint before securing the remainder of the sheet to the wall. *Do not lap joints.*

Use a 3-in. scraper or broad knife for application, scraping the surface with heavy pressure in the direction of the grain only, eliminating all paste and air pockets.

A paper hanger's roller is not satisfactory.

Sheets shall be bent and thoroughly secured at reentrant angles and corners.

Do not moisten the face of Flexwood, except as may be necessary to wipe off the paste. This must be done carefully, using a moist sponge—*not wet.*

(10) Solid Wood Trim

Note: *See also note following par. (1).*

(10a) After the Flexwood is thoroughly dry and before finish is applied, *(this contractor) (the Carpentry Contractor)* shall apply all solid wood trim over the Flexwood in accordance with detail drawings.

(10b) Trim consisting of *(cornices) (picture moulds) (wainscot caps) (baseboards) (panel moulds) (specify)* shall be accurately and substantially applied. All joints shall match perfectly and all nails shall be neatly set.

Sand smooth and putty all nail holes.

(11) Finishing

(11a) Inspection and Preliminary Preparation—Inspect the wall critically before finishing to insure against air pockets not thoroughly and permanently secured to the wall.

Spots not properly secured may be detected by the hollow sound when the finger tips are passed lightly over the surface.

All spots not properly pasted tight shall be pasted tight by the aid of a warm pressing iron, placing a piece of scrap Flexwood, wood to wood, against wall under the iron.

(11b) Filling Knots in Flexwood—Where the wood knots have fallen out, they shall be replaced with Swedish Putty, using the following formula:

Whiting—2 parts by volume
Plaster of Paris—1 part by volume

Mix these powders thoroughly and then add glue size (one half to one pound of ground glue to a gallon of hot water).

Stir the powder and the glue size together until a very stiff consistency is obtained (almost too thick to stir) then thin to a working consistency with varnish. This may be colored to match wood with standard dry colors.

The Swedish Putty shall be applied over the knot hole with a putty knife and allowed to dry. It is then sanded and shellaced. The knot is then painted in by hand, using an artist's brush.

(11c) Sanding—Thoroughly sand the Flexwood surface to a uniformly smooth high polish, using fine sandpaper. Sand only in the direction of the grain.

Note: *The quality of the final finish, as on any wood surface, is dependent upon its smoothness prior to finishing.*

(11d) Finish—Be sure all paste spots have been removed and Flexwood has been drying at least 48 hours before applying finish.

Note: *Here specify the particular finish selected.*

Note: *A wide variety of finishes may be applied to the Flexwood surface. Most progressive decorators, as well as* The Flexwood Company, *advocate the use of the wood in its natural color, without stains or filler.*

Both stains and wood fillers may be used as on any wood surface, but open pore (unfilled) work is recommended, since it shows the texture and quality of the wood to the best advantage.

Excellent results are obtained with two coats of flat lacquer or a coat of gloss varnish followed by a coat of flat varnish and for either finish one coat of thin shellac may first be applied to Flexwood.

Due to unavoidable irregularities, inherent in wall surfaces, gloss finishes are not recommended.

FLEXWOOD — SHORT FORM SPECIFICATIONS

Flexwood, as manufactured by The Flexwood Company, 4413 West Division Street, Chicago, Illinois, shall be applied in strict accordance with the manufacturer's most recent specifications, to the areas specified below, or as indicated in blueprint (see note). This contractor shall also submit samples of the finished Flexwood to the architect, if required, for approval before proceeding with the work. This sample shall be picked from wood which will be used on this job.

Note: *Specify the areas to be covered, giving a list of the wood to be used as well, or refer to the blueprint by sheet and number.*

Fir Gutters for Beauty, Permanence and Economy

In the early days of American building, gutters of wood were commonly used for all types of structures. The passing of years brought gutters of other materials but time proves all products and today finds the wooden gutter more popular than ever before.

Beauty—"Improved" Fir Gutters possess that outstanding beauty which can only come through the use of the right materials to meet definite requirements. "Improved" gutters, with their excellent proportions and refined lines lend distinction to any cornice detail. There is nothing artificial about a wooden gutter; it harmonizes with any type of architecture, wall material or roofing. There are no hard angles or awkward curves to destroy a carefully designed effect. Moulded wood is always appropriate.

Permanence—The second feature of "Improved" gutters is their permanence. They are made of clear, carefully selected durable Douglas Fir. They cannot corrode or disintegrate when exposed to the natural elements, smoke, fumes or acids. They cannot possibly contract or expand under varying weather conditions. Ice, snow or winds fail to tear them loose from the building. Leaning ladders cannot damage them. A carpenter can walk on an "Improved" Fir Gutter without doing the least damage. Strength and rigidity are special features.

The New "Shadowline" Design

Economy—The third feature of these gutters is their economy. Their first cost is no more than that of an ordinary gutter. In most cases, it is less. When they are used no roof mould is necessary. The gutters need only be painted when the house is painted with any good lead and linseed oil paint. But, the biggest economy lies in their durability. With "Improved" Fir Gutters on the house it will never be necessary for the home owner to buy gutters again. These replacement savings are certainly worth-while economy.

Leakproof Fittings for Ends, Joints and Miters

As the result of long experience THE E. M. LONG CORPORATION has developed a complete set of fittings to prevent leaking at the joints, miters and ends of "Improved" gutters.

The end fittings are of cast aluminum, right or left and are furnished complete with brass screws. The miter joint fittings for either in or out miter consist of two brass angles of the proper size with brass screws and four divergent corrugated coated fasteners. Brass screws and divergent corrugated fasteners are recommended and supplied for securing straight spliced joints.

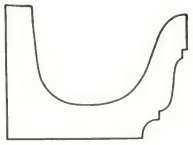
Manufacture and Shipping

In the manufacture of "Improved" O.G. Fir Gutters great care is taken by the mill to see that each piece is perfectly machined. Skilled workmen equipped with modern machinery turn out thousands of feet of gutter each day. So exact is their workmanship that every piece of gutter is like every other piece even in the minutest detail.

A stock of approximately one-half million feet is maintained at our Cadiz, Ohio, warehouse in assorted sizes and lengths to assure prompt shipments at all times. Customers in western and northwestern states desiring less than carload shipments will be supplied direct from our mill in Washington at a considerable saving in freight.

The stock sizes of the gutters are 3x5, 4x5, 4x6, 5x7 and 6x8 in. in the rough. Larger or smaller sizes can be furnished on special order, in mixed cars with West Coast lumber and millwork. Finished sizes are shown in the drawing below.

The Gutter Used By Many Railroads



Railroad structures provide a severe test for any gutter due to the effect of smoke and gases. Probably there can be no stronger proof of the lasting qualities of Fir Gutters than the fact that more than 25 railroad lines are using them today for stations, freight depots and all types of railway buildings.

Below are listed some of the present railroad users:

Pennsylvania
Central of Georgia
New York Central Lines
The Delaware and Hudson
Florida East Coast
Rock Island
Big Four Lines
Chicago and Northwestern Line
Pere Marquette
Nickel Plate Road
Atlantic Coast Line
Toronto, Hamilton and Buffalo
Maryland and Pennsylvania
Mobile and Ohio
Atlantic and West Point
Wheeling and Lake Erie
East Carolina
The Virginian
The Western Railway of Alabama
Nashville, Chattanooga and St. Louis

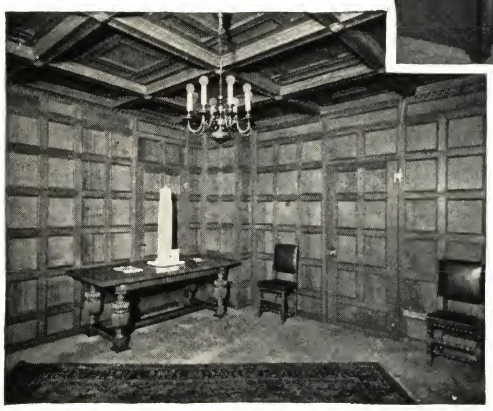
NEW YORK, N. Y.

FINE INTERIOR WOODWORK

A master architect knows he must employ the services of master craftsmen if the finished product is to be a compliment to his efforts. Our business is built on our ability to carry out specifications to the smallest detail, and our application of high quality workmanship and materials to every job we touch, large or small.



While our installations have been confined chiefly to supplying commercial and financial houses with their paneled directors' rooms, executive offices, and other fine cabinet work requirements, our long experience and ample factory space make us thoroughly equipped to supply the fine paneling and architectural woodwork to the quality homes that are in a position to demand the best in interior decoration.

Your attention is called to the durability and permanent value of wood interiors in comparison with all other materials. Today, as throughout the centuries, the richness of fine cabinet woods remains unchallenged in the achievement of dignity and distinction in interior decoration.

Some of our finest installations have been in Old English Oak, African Mahogany, Knotty Pine, and Walnut.

"NEVER GIVE" LOCK JOINT WOOD COLUMNS

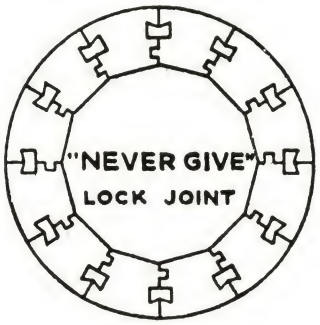
MANUFACTURED BY SOMERSET DOOR AND COLUMN CO., SOMERSET, PA.

AMERICAN WOOD COLUMN CO.

905 Grand Street, BROOKLYN, N. Y.

Products

"Never Give" Patented Lock Joint Wood Stave Columns for exterior and interior use.



Cast Iron Plinths for columns.

Also, Pilasters and Balusters to match "Never Give" Columns.

Architectural Service

Somerset specializes in building wood columns to the architect's details and can supply any size or design wanted, or, if no specific design is indicated, will prepare one in accordance with the best architectural practice and for any period, and submit full sized detail for approval.

Selected stock designs conform to the standards of Vignola and include lock joint turned columns, plain or fluted, and square columns, plain, fluted, or paneled. Somerset is particularly well equipped to supply fluted columns.

TRADE-MARK

"Never Give" Patented Lock Joint Columns

Construction—"Never Give" Patented Lock Joint Column staves are held tightly together by a counter-beveled spline of hardwood machine-driven through the length of the column, using a sufficient quantity of waterproof glue to secure it completely. No metal bands are required to hold the staves together with such construction, and an unconditional guarantee is given that "Never Give" Columns will not fail by opening at the joints.

Proportions—"Never Give" Columns are architecturally correct, having proper entasis, stopped flutes and other characteristics of the columns of ancient classical orders.

Unless otherwise specified, the staves are worked to the correct entasis (convex curve) in the rough before being placed in the columns (one-third straight and upper two-thirds swell tapered). This method not only gives proper entasis when columns are turned and finished, but also insures maximum thickness of stock throughout the entire length.

Materials—"Never Give" Columns are regularly made of poplar, cypress and white pine, only best grade material being used, but columns will be made of any wood desired. All lumber is kiln dried and tested for moisture content before use in manufacture. The wood should be specified from which columns are to be made.

Samples—A sample of the "Never Give" Patented Lock Joint may be had on application.

Information Required for Estimates

In asking for estimates, indicate the number of columns and design wanted, the kind of wood, the largest and smallest diameters of round columns or widths of square columns, the over-all lengths, whether the shafts are to be plain, fluted, or paneled, and whether the columns are for exterior or interior use. State the nature of the surface on which the column is to rest, whether priming of the wood before shipment is required, and whether the cove of the columns is to be a part of the shaft or may be planted on. Also give the thickness of shaft, if to be greater than standard thickness given in table "Shaft Thickness for 'Never Give' Columns."

Specifications

In specifying, it should be clearly stated that all columns are to be "Never Give" Lock Joint construction, using hardwood spline and waterproof glue, as sold by the American Wood Column Co., 905 Grand Street, Brooklyn, N. Y. The information required for estimates as set down above should also be supplied.

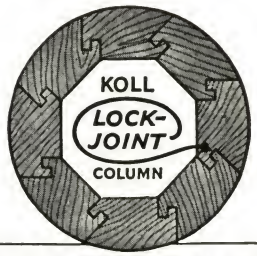
HARTMANN-SANDERS CO.

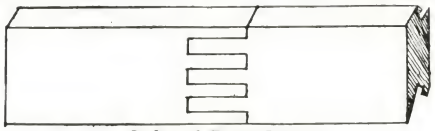


Exclusive Manufacturres of Koll's Patent Lock-joint Wood Staved and Turned Columns

MAIN OFFICE AND FACTORY
2155-2187 Elston Avenue, CHICAGO, ILL.
EASTERN OFFICE, 101 Park Avenue, Architects Building, NEW YORK, N. Y.

Products

KOLL'S PATENT LOCK-JOINT WOOD STAVE COLUMNS for exterior and interior; columns made in all woods. ROPED COLUMNS with pilasters and square columns. EXTERIOR AND INTERIOR COLONIAL WOODWORK. COMPOSITION ORNAMENTAL CAPITALS.



Also manufacturers of Pergolas, Lattice Work and all architectural work for the garden.

THEY CANNOT COME APART

Spliced Butt Joint

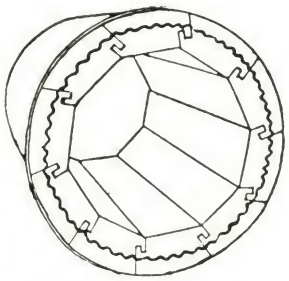
In addition to the perfect lock joint of the staves, a joint has been devised to splice

Spliced Butt Joint

the butts of the staves should the length of column call for material longer than can be secured in one piece. In this process joints are put together with screw pressure and cold water waterproof glue, another feature which adds to make these columns mechanically perfect.

Architect's Details

Columns conform accurately to any detail, are of the best materials and at as reasonable rates as are consistent with good work.



Our Patent Correct Entasis

Correct entasis secured in forming stave itself—The staves in all columns manufactured under Koll's patent are, in order to secure the proper entasis, straight one-third and swell-tapered upper two-thirds, so that when shaft is formed the correct entasis is obtained, securing sufficient stock at top and bottom of shaft to permit turning to detail without cutting too close to joint.

Columns furnished with any style of fluting or reeding desired.

Steel Reinforcement

A corrugated steel band or ferrule reinforcement is applied to the bottom end of all Doric columns. The steel band, while adding considerable strength to the shaft, permits some flexibility so that no injury can be done by moisture that may be absorbed. This reinforcement is also added to both ends of all large column shafts.

Style C Cove

KOLL'S PATENT WOOD COLUMNS

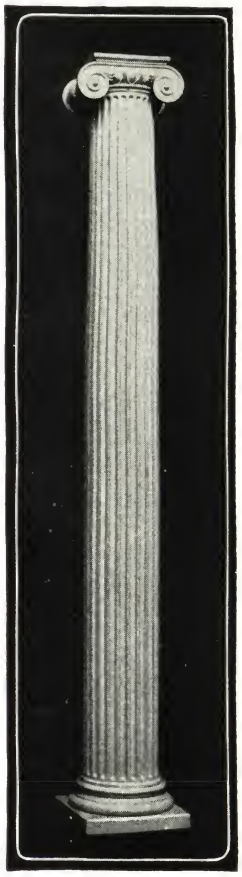
	2-in. stock	2½-in. stock	3-in. stock	4-in. stock
With Cove on Shaft Like Style A				
Plain shaft .....in.	up to 18	19 to 22	23 to 30	31 and up
Doric and Ionic fluted .in.	up to 16	17 to 19	20 to 27	28 and up
Doric fluted, No. 195...in.	up to 22	21 to 28	29 to 39	40 and up
Cove Planted on Like B, or Made a Base Member Like C				
Plain shaft .....in.	up to 22	23 to 30	31 to 40	41 and up
Ionic fluted .....in.	up to 22	23 to 28	29 to 38	39 and up

Note: Before ordering columns, it would be well to examine detail closely and note whether the cove is to be part of the shaft, or whether this can be planted on. This company can make the column either way, but of course must be guided by what specifications and details call for.

Waterproof Glue

All columns are glued with cold water, waterproof, casein glue.

The staves of all columns and all exterior work produced by us are put together with waterproof glue. The inside of all columns and pilasters above 14 in. is waterproofed with a special waterproof compound.



Thickness of Stock

As the price of the column is regulated by the amount and kind of lumber that enters into its construction, it is very important to state in the specifications the thickness of stock of which columns are to be made.

Our experience as specialists in column construction has demonstrated that the thickness of stock for the various sizes, as called for in the table on the following page, provides enough material to carry out properly the architectural detail and to afford the required strength. Should an unusual load be placed on the columns, they can be reinforced by inserting a timber or iron column. When necessary to incase a structural timber or iron column already in place, columns can be made in halves and doweled or rail bolted as desired.

Flashings

The entire top of all wood and ornamental caps should be flashed with either galvanized iron, copper or sheet lead to protect the same from the weather. These flashings will be furnished when the specifications call for them.

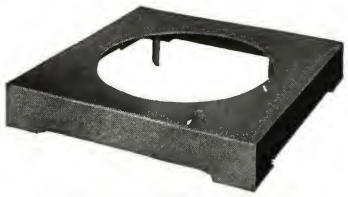
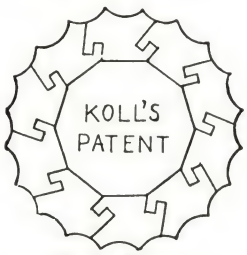
Roped or Twisted Column



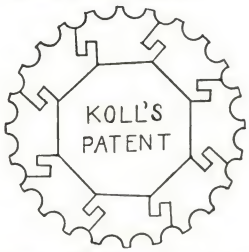
We make columns up to 54-in. diameter and proportionate length.

Roped Columns



We have facilities for making roped columns and Colonial roped balusters, both for exterior and interior work. The roped column shown is our stock design, but we can furnish the same according to the architect's detail if desired.

Cast Iron Metal Plinths



When columns rest on cement or brick floor, the use of cast iron metal ventilated plinths is recommended. We furnish these in all sizes.

Cast Iron Metal Plinth

Doric Fluting Columns, 195, 195⅔, 215 and 215⅔

Ionic Fluting Used on All Other Fluted Columns Shown in Catalogue

Specifications

As a guide to the architect, we offer the following paragraph for properly specifying our columns in his specifications:

Columns to be the Koll's Patent Lock-joint Staved Wood Column, manufactured by the HARTMANN-SANDERS Co., Chicago and New York, to be made according to their design No. .... (here specify the number in catalogue and if design is to be made according to the architect's drawing say: To be made according to details furnished). Staves to be made of clear stock (here specify the thickness wanted). See schedule for thickness of staves necessary for the various sizes of columns. Shafts, bases and gaps to be glued with waterproof cold water glue; for staves longer than ordinary lumber length, the staves are to be lengthened with a splice joint. The top of all column caps is to be flashed with galvanized iron (sheet lead or copper). The flashing to extend half-inch over the edge of caps. The square plinths of column to be cast iron ventilated plinths (or proper ventilation to be provided for the columns if stone concrete or wood plinths are to be used).

Columns to be primed at the factory with a coat of white lead and oil on the outside, and all columns above 14 in. to receive a coat of waterproof asphaltum paint on the inside of shaft.

Should the columns arrive at the building before they are ready to install, they must be stored in the building, or properly protected with waterproof coverings in a thorough manner, including both ends, and top of the column shafts. Do not lay columns directly on the ground.

Entrance to the Old Runyon House, Trenton, N. J.

Entrance to the City Tavern, Alexandria, Va.

Instructions for Ordering

When ordering columns from our catalogue refer always to our catalogue numbers—give quantity wanted and size at largest and smallest diameter of shaft, and length over all. State if for *interior* or *exterior* use.

Note: All our details are carefully planned from the dimensions given by the approved authorities but we make no extra charge for following your detail, if similar to any of the designs shown in our catalogue.

We will promptly furnish estimates on any special column or pilaster work according to architect's drawing and full size details.

When ordering pilasters to match columns, give dimensions at top as well as bottom of shaft, or state whether width is to be equal to the largest or smallest diameter of the column, or if they are to have the mean diameter of column shaft or if they are to have the same taper as the column. This, you will note, makes four ways of making square columns and pilasters. Give also depth of return. Refer to line drawing of sections of columns and pilasters when ordering.

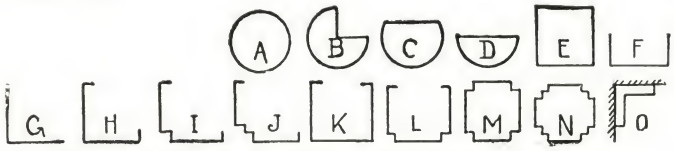


Diagram Showing Section of Columns and Pilasters

We prime all exterior and interior columns (unless made of hardwoods) one coat of lead and oil unless otherwise notified. We make no extra charge for priming.

When composition caps are to be used, we furnish without extra cost suitable wood dowels with columns to carry the weight of the overhead work.

Details

Unless specified to the contrary when ordering, all columns are made according to the proportions of the styles of architecture shown by the various cuts in the catalogue, but we can, if desired, make them according to the architect's detail.

Colonial Entrances and Millwork

Our extended efforts in the field of Colonial Architecture has enabled us to develop our organization to such a degree that we are in position to furnish in addition to our columns and pilasters, also Colonial entrances and millwork generally, either to the architect's detail or our own design.

Catalogues

We publish the following catalogues, which we would be glad to send on request:

Catalogue No. 48-8, Wood Columns and Pilasters.
Catalogue No. 53-8, Colonial Entrances.

A. F. SCHWERD MANUFACTURING CO.

Manufacturers of Wood Staved Columns

PITTSBURGH, PA.

Schwerd's Quality Columns

The A. F. Schwerd Manufacturing Co. has for many years been contributing to the architecture of this country wooden columns that are not only correct artistically, but scientifically as well. Many of these columns, installed in buildings a quarter of a century ago, are in as good condition as when they left our factory.

Our painstaking attention to detail in the manufacture of these columns has made the name "Schwerd's Quality Columns" known throughout the building industry.

Service to Architects

For the convenience of architects, contractors and builders in ordering columns, the information set forth in the following pages has been compiled by an architect of prominence. The designs and proportions have been worked out in accordance with the best practice and are suitable for use with the very highest class of work.

The dimensions given in the tables on the following pages are authoritative and render further research unnecessary. Architects are urged to place their column problems with us because of our facilities for production and service.

THE MANUFACTURING OF "SCHWERD'S QUALITY COLUMNS"

Seasoning of the White Pine Lumber—*White Pine Lumber is used exclusively in "Schwerd's Quality Columns."* To serve properly its purpose as a support and to withstand successfully the action of the elements, a column must be made of thoroughly seasoned stock. We maintain at all times a year's supply of lumber at the source of supply, where it is seasoned by nature's slow but sure process—the open air.

Making the Staves—The stave machines were built specially to the order of the Schwerd Company. These machines shape and taper and tongue and groove the staves in one operation. By this method, when the staves are glued together, the shaft has the proper entasis, and the turning removes only the roughness of the lumber without weakening the shaft, and leaves shaft equal in thickness of material at any point in its length—an important detail in the life of a support.

Assembling and Gluing—After forming, the staves are spread with a special waterproof glue (by means of rotary brushes so that an even and properly distributed coat is maintained) and assembled. Heavy screw clamps, having a pulling power of 5000 lb., are then applied and drawn tight.

Caps and Bases—These members are made of mitered pieces and held together with corrugated steel fasteners and waterproof glue. This process seals the joints against moisture and prevents opening and consequent decay.

Column Troubles Eliminated—See that columns are in good condition before taken from the railroad station—or have notation made by your agent on your freight receipt of the damage.

See that columns are kept stored in a dry place.

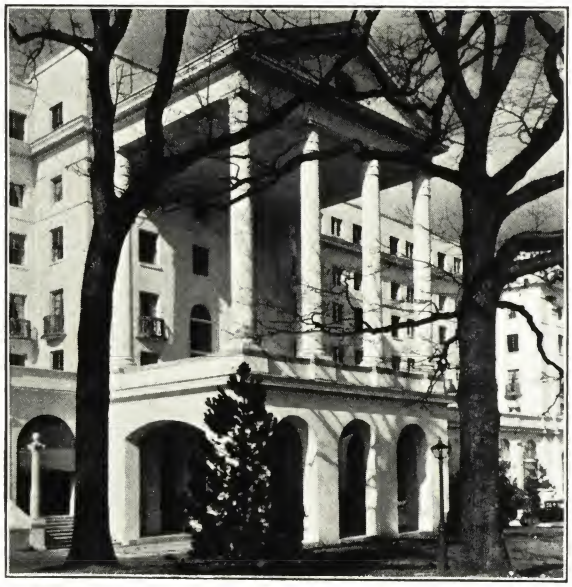
Do not allow columns to lie in damp cellars or newly plastered houses. Do not set up column until the porch roof is finished. Set base and bottom end of shaft in heavy layer of white lead.

Paint Columns as Soon as Placed—We prime to protect the surface.

We are convinced that by observance of the above rules you will eliminate column troubles, as our long experience and close investigation show that a big percentage of trouble arises from causes beyond the control of the manufacturer.

REASONS FOR THE DURABILITY OF "SCHWERD'S QUALITY COLUMNS"

If a column were made of steel, it would be possible to so fashion the joints of the staves that they would rigidly interlock without any other attachment. In the past, attempts have been made to apply this same principle to wooden columns but it has not been successful, because the strength of wood is not sufficient to withstand the necessary tension on the interlocking members.



In every test, whether for demonstration purposes or in actual service, the strength of a wood column will be found to be that of the glue in the joints.

Realizing this, the gluing of the Schwerd Column is made a matter of utmost importance. The glue used is the strongest, most permanent glue obtainable. Schwerd millwork is done with such accuracy that the gluing surfaces meet absolutely flush at every joint. Tremendous pressure is applied to the freshly-glued column so that every particle of glue is either forced into the wood or from the joint.

The result of Schwerd gluing is a joint that is actually stronger than the solid wood, a column that will endure until the building of which it is a part is ready to be demolished.

Composition Caps can be furnished in any style desired.

Products

TURNED COLUMNS, SQUARE COLUMNS and PILASTERS for Exterior and Interior Work.

Also Pergola Work; Twisted Columns; Composition Capitals; Wood Carving; Cast Iron Column Plinths; Balusters; Small Turnings.

GUARANTEED

TRADE-MARK

Executing Work to Details

We specialize in building columns to architect's details and especially solicit this class of business.

Unless details are furnished standard designs are made to conform to the Architectural Standards of Vignola. Columns are made turned, either plain or fluted; and square, either plain, fluted or paneled. Pilasters can be supplied to match any column.

Requirements for twisted turnings can be met without delay. Special machinery has been installed to do this type of work.

Triumph Lock Joint

Particular attention is called to the patented lock joint used to lock the staves of our columns securely together. The design of this joint is such that it also gives an unusually large area of contact between glued surfaces, thus giving increased security against opening up of the joints.

Waterproof Glue

Waterproof, cold water glue is used in putting together all columns, pilasters, caps and bases to prevent the destructive effect of moisture on joints.

Stock and Thickness

Unless otherwise specified, all Triumph columns are made of white pine expressly selected for our use. We can, however, furnish any wood desired. It is important that the desired thickness of stock be specified, as this determines the price to a large degree. Stock 1½ to 4 in. thick is used, depending on size of column and load to be carried. In general, the following proportions are used:

*Diameter of column	Up to 20 in.	20 to 26 in.	26 in. up
Thickness of stock	2 in.	2½ in.	3 in.

*For unusual heights or loading, consult us for specifications.

Entasis

All staves are formed to correct entasis in the rough, thus securing maximum amount of stock. Staves are made one-third straight, upper two-thirds tapered, unless otherwise specified.

Caps and Bases

Columns can be furnished with wood caps and bases, or with composition caps of any style desired. Special detail capitals of either composition or carved wood can also be furnished.

When desired, we are prepared to furnish cast iron plinths in all sizes.

Flashing

When erecting, cap must be entirely covered with flashing of sheet lead or copper. Architects should not overlook this in their specifications.

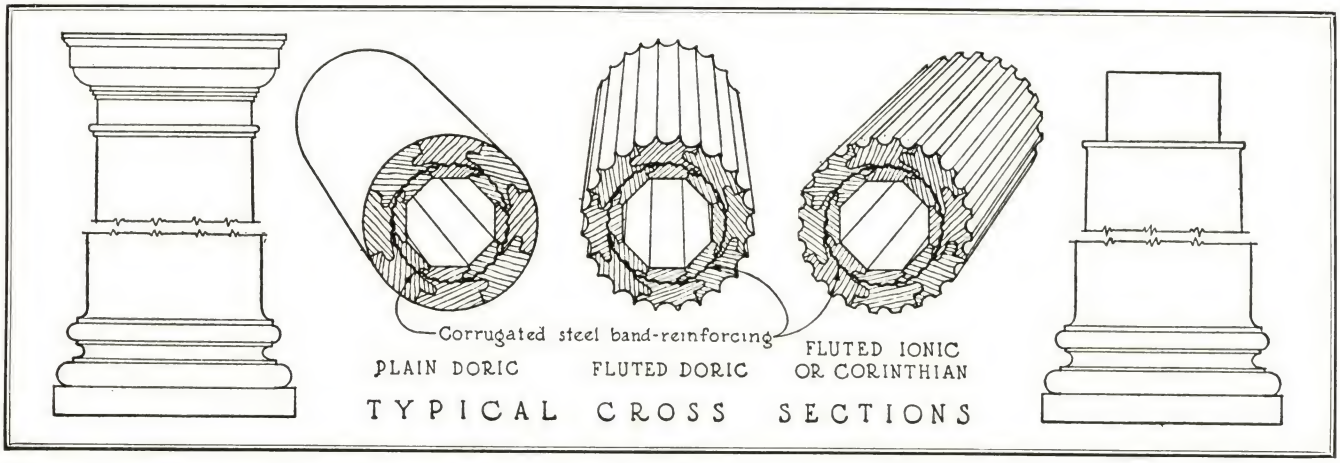
Reinforcing

The bottom of all columns without bases and the bottom and top of all large columns are reinforced with a heavy corrugated steel band. See detail below.

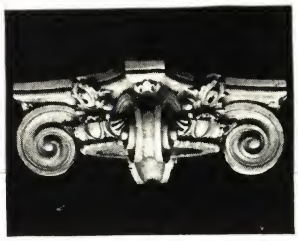
Waterproofing

The insides of all columns 16-in. diameter and over are painted with a special waterproofing paint.

Priming



Unless otherwise specified, all columns and pilasters are given two priming coats of paint specially designed to give protection but easily covered by a finish coat which should be applied immediately on receipt of columns.



Guarantee

All columns are absolutely guaranteed as to material, workmanship and durability. Defects due to inferior materials or workmanship will be rectified without question.

Architect's Specification

All exterior columns shall be built up of selected white pine staves [other woods, such as cypress, may be used when desired], which shall be joined by a lock joint with waterproof cold water glue. Stock to be used shall be (*) in. thick. The inside of all columns 16 in. in diameter and over shall be coated with a waterproofing paint and all columns shall be primed at the plant of the manufacturer with a protective paint In erecting, care must be taken to cover entire caps of all columns with flashing of copper or sheet lead.

Stock and Special Designs

Ten classical designs are shown herewith.

Our portfolio of designs and installations shows many buildings where our columns have been used and a large number of attractive Colonial entrances. Also an attractive line of garden pergolas. Write for combined column and pergola Catalog No. 50-D.

Advantages of Union Metal Columns

(1) Architecturally correct.
(2) Clean cut, highly ornamental and stately.
(3) Will not rot, check or open at joints.
(4) Fireproof and weatherproof.
(5) Have entasis and stopped flutes.
(6) Not experimental, but used on thousands of representative buildings in the United States and abroad.
(7) Indestructible and will outlast the buildings; suitable for all climates and temperatures.
(8) Easily handled, transported and erected.

Load-bearing Formulae

(Result of tests made by Robert W. Hunt & Co.).

Applies to designs, Numbers 240, 246, 212, 213, 219, 224, 230, 237 and 222.

For 1-ply, 22 gauge shaft:
460 x top diameter in inches equals .... pounds dead load.
For 2-ply, 22 gauge shaft:
860 x top diameter in inches equals .... pounds dead load.

Example: 12-inch diameter column tapering to 10-inch top diameter—
1-ply shaft: $460 \times 10 = 4600$ pounds dead load.
2-ply shaft: $860 \times 10 = 8600$ pounds dead load.

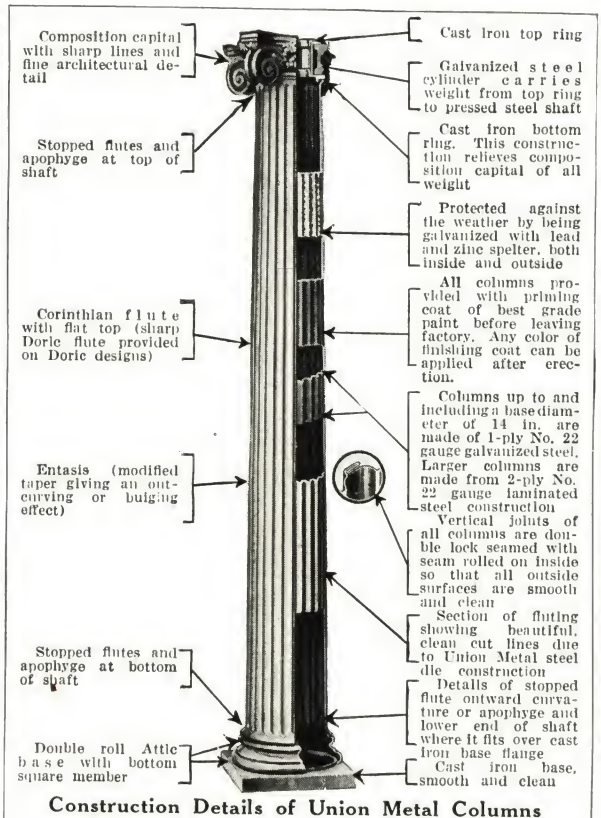
Note: When designs using composition capitals are ordered and are expected to carry an unusually heavy weight, this should be explained to us so that a heavier core band than ordinarily furnished will be supplied for inside the capital.

Load-bearing Formula for Design Number 700—

For 1-ply, 22 gauge shaft:
1250 by top diameter in inches equals .... pounds dead load.
For 2-ply, 22 gauge shaft:
2000 by top diameter in inches equals .... pounds dead load.

Example: Number 700 column, 12-inch tapering to 9-inch top diameter—
1-ply shaft: $1250 \times 9 = 11{,}250$ pounds dead load.
2-ply shaft: $2000 \times 9 = 18{,}000$ pounds dead load.

A safety factor of 2 is recommended.



Standard practice is to furnish columns up to and including 14-inch diameter with 1-ply shaft, but when desired, 2-ply can be furnished at an increase in price. All columns larger than 14-inch diameter are furnished 2-ply, 22-gauge shaft.

Architects' Specification

The fluted columns used shall be Union Metal Pressed Steel Columns with entasis and stopped flutes, manufactured by THE UNION METAL MANUFACTURING CO., Canton, Ohio. The design number, style and size of columns to be used are indicated on drawings. The manufacturer shall apply a priming coat of high grade paint to all columns before shipment from his plant.

Designs 240 and 246

Design 700

Pilasters and Odd Shaped Columns

We can furnish flat and corner metal pilasters and half-round and three-quarter round metal columns in all sizes to match stock or special designs of Union Metal Columns.

A—Quarter return pilaster
B—Half return pilaster
C—Unequal return pilaster
D—Quarter return corner pilaster
E—Half column
F—Three-quarter column
G—Three-quarter corner column

Union Metal Pilasters and Odd Shaped Columns

When ordering pilasters, specify whether face shall be tapered to match columns or whether face shall be straight from top to bottom. Unless otherwise ordered, bottom and top faces of pilasters will be furnished same as bottom and top diameters of columns, in which case pilaster bases and caps will match those of columns in height A. All Union Metal pilasters are fluted on front face to match columns but are not fluted on return faces without extra cost. Pilasters are not provided with entasis
